Note In this book, two eminent authorities on juvenile delinquency and criminology report the results of their analysis of the role of body structure in juvenile delinquency Employing the somatotype terminology of William H. Sheldon, they investigated endomorphy mesomorphy and ectomorphy as factors in deviation from normal behavior by young people. The findings are presented in a compactly written text and in an extensive series of tables. Among the authors' conclusions "It has been established, for example, that the predominantly mesomorphic constitution has greatest strength and a different rhythm of energy discharge and control of impulse than the obese endomorphic, or the fragile ectomorphic types. It has also been shown that the delinquency of ectomorphs would seem to stem largely from their over-sensitiveness and over-responsiveness to the unwholesome influences of home and family life. Consequently though an essentially genetic explanation of varying behavioral inclinations may be criticized as onesided, essentially psychoanalytic or sociocultural explanations are open to like criticism." Included among a series of appendixes is an explanation of the statistical method used of the method of somatotyping and various concise summaries, such as a "Summary of significant variations in trait incidence by physique types.

GOLDSTEIN, KURT

Human nature in the light of psychopathology Cambridge Mass. Harvard University Press 1940 258 p illus. 19 cm (The William James lectures delivered at Harvard University 1937–38) $3 50 4972

Contents. The holistic approach and the analytic method in science. Pathology and the nature of man. The abstract attitude and speech. Ordered and catastrophic behavior anxiety and fear Coming to terms with the world. On the motives actuating human behavior On the structure of personality The individual and others. The fallacy of "isolation in social philosophy Notes. Index.

Note A book treating the reactions of the individual to his social surroundings with reference to mental and physical diagnosis and therapy The lectures upon hich it is based were intended especially for educators and physicians.

HATHAWAY, STARKE R, AND ELIO D MONACHESI, editors

Analyzing and predicting juvenile delinquency with the MMPI. Minneapolis University of Minnesota Press 1953 153 p illus. 23 cm $3 50 4973

Contents Part I, Juvenile delinquency and the MMPI. Personality patterns of adolescent girls Delinquents and nondelinquents, by D F Capwell. The personality patterns of juvenile delinquents as indicated by the MMPI, by E. D Monachesi. Personality patterns of juvenile delinquents in an area of small population, by J H. Ashbaugh. MMPI findings in the rehabilitation of delinquent girls, by M. Lauber and W G. Dahlstrom. The relationship between MMPI profiles and later careers of juvenile delinquent girls, by S. R. Hathaway and others. Personality characteristics of adolescents as related to their later careers Part I, Introduction and general findings, by S. R. Hathaway and E. D Monachesi. Part II, Two-year follow-up on delinquency by S. R. Hathaway and E. D Monachesi. Significance of findings. References. Index.

Note. The studies published in this volume all bear on the application of the Minnesota Multiphasic Personality Inventory in analyzing the personalities of juvenile delinquents and in predicting delinquency by analyzing the personality of adolescents before delinquency occurs. Included are some studies made on groups of children younger than the age in which delinquency usually develops and follow-up studies of the same groups some years later hen the delinquent behavior of some members had emerged. The book is intended for psychologists ho are familiar with the principles and terminology of the MMPI.

JOHNSON, WENDELL, editor

Stuttering in children and adults. Thirty years of research at the University of Iowa. Edited by Wendell Johnson, assisted by Ralph R. Leutenegger Minneapolis University of Minnesota Press, 1955 472 p. illus. 23 cm. $5 75 4974

Contents. Part I, General orientation The time the place, and the problem, by W Johnson. A systematic approach to the psychology of stuttering, by W Johnson and J R. Knott. Part II, The onset f stuttering: A study of the onset and development of stuttering, by W Johnson. The relationship of parental attitudes and adjustments to the development of stuttering, by F L. Darley Part III, Nonfluency in the speech of early childhood. Studies of nonfluency in the speech of preschool children, by M. E Branscom and others. Repetitions and prolongations in the speech f stuttering and nonstuttering children, by G. G. Egland. Nonfluencies in the oral reading of stutterers and nonstutterers of elementary school age, by M. B. Mann. Part IV Variations in amount of stuttering: The quantitative measurement of the effect of certain situations on stuttering, by C. Van Riper and C. J Hull. Factors influencing the variability f stuttering, by E. Shulman. Frequency of stuttering in relation to induced modifications following expectancy of stuttering, by E. T Oxtoby Explorations of experimental extinction and spontaneous recovery in stuttering, by E. L. Jones. Stuttering adaptation in relation to assessed level of anxiety by C. C. Dixon. The cumulati effect of constant and varying reading material on stuttering adaptation, by A. Golden. Spontaneous recovery of the stuttering response as function of the time following adaptation, by D J. Jamison. Spontaneous recovery of the stuttering response as a function f the degree of adaptation, by J V Frick. The role of cues in stuttering adaptation, by E. Y Fierman. Stuttering adaptation during three hours of continuous oral reading, by L R. Donohue. Experimentally induced changes in the relative frequency f stuttering on specified speech sound, by M. H. Connett. Stuttering in response to photographs of selected listeners, by N H. Berwick. Correlation in frequency of types of stuttering reactions, by J W Chotlos. The effect of instructions concerning mode of stuttering on the breathing of stutterers by W Downton. Effect on stuttering of alteration in auditory feedback, by M. L. S. Shane. The effect of pentobarbital sodium (nembutal) and amphetamine sulphate (benzedrine) on the severity of stuttering, by W R. Love. Part V Certain aspects of the personal adjustments of stutterers. Sense of humor in stutterers and nonstutterers, by L. C. Staats, Jr A test of attitude toward stuttering, by G. M. Friedman. An exploration of stuttering by J Frasier A study of the role of inhibition in the moment of stuttering, by M. C Tenberg. A speech situation rating sheet for stutterers, by L. C. Shumak. A study of educational adjustments of stuttering and nonstuttering children, by M. D Schindler. Part VI, Explorations of certain physical approaches to stuttering: A comparati study of stutterers and nonstutterers on psychometer discrimination task, by F L. Ross. A study f the motor integration of stutterers and nonstutterers, by J B Rotter. Tension and facial appearance in stuttering, by J C. Saldecor Incidence of stuttering among twins, by O. L Graf Part VII, For the record": A comparison of the free associations of stutterers and nonstutterers, by M. McK. Faust. The effect of negative instruction on the motor control of stutterers, by M. B. Hemenstreit. A study of the speech difficulties of thirteen stutterers, by B. Bryngelson. A study of tonal intensity and duration in the nonstuttered speech of stutterers and nonstutterers, by S. S. Shaw A comparison of certain sound wav characteristics of stutterers and nonstutterers, by L. H. Adams. Part VIII, Approaches to stuttering therapy Intensive clinical case studies of stuttering therapy by D. E. Williams. Bibliotherapy for stutterers, by E. McK. Lynch. A stutterer's experiences in using an electrolarynx, by F A. McKenzie. Courses in speech pathology in the college transcripts of fifty teachers, by F A. McKenna. The descriptional principle and the principle of static analysis, by W Johnson. Appendix: A bibliography of University of Iow studies of stuttering through 1954. Index.

Note. Over period of three decades, much important research on the causes and treatment of stuttering has been done at the University of Iowa. Collected in this volume are all of the research studies not previously published, including both papers and

Lowered vitality. Miscellaneous physical conditions. Part III, Mental growth and development. The nature of intelligence. The slow-learning. The rapid-learning. The mentally gifted. Part IV Neurological and psychogenic disorders: Epilepsy. Psychotic conditions. Miscellaneous neurological conditions. Part V Behavior adjustments: Mechanisms of behavior. Behavior causes and methods of diagnosis. Remedial and preventive measures. Part VI, Educational retardation. Part VII, General problems, summary and conclusions: General scope of the problem. Desirable attitudes toward the exceptional. Appendix. Index.

Note: An established textbook for courses offered in schools of education and in teachers' colleges. As the chapter titles indicate, it covers all kinds of exceptional children, including the physically handicapped, the mentally gifted and the mentally subnormal. It provides a general view of the subject with emphasis on those aspects that are of particular interest to teachers. However, its scope is broad enough to make it useful also to educational administrators and supervisors and citizens generally. The first edition was published in 1944. Most of the text of the first edition has been carried over to the second edition. However, revisions have been made in a number of the chapters, and literature published since the first edition was written has been added to the bibliographies.

BARKER, ROGER G., AND OTHERS editors

Child behavior and development, a course of representative studies edited by Roger G. Barker Jacob S Kounin, and Herbert F Wright. New York McGraw Hill Book Company Inc., 1943 652 p. illus. 23 cm. (McGraw Hill publications in psychology J F Dashiell, consulting editor) $6 75 4986

Contents: Research in child psychology: history and prospect, by L. K. Frank. Reflex activities in the human fetus, by D. Hooker. The activities of newborn infants, by O. C. Irwin. The development of prehension in infants, by H. M. Halverson. Conditioned responses in human infants, by M. A. Wenger. Mental growth during the first three years, by N. Bayley. Language development in the preschool child, by D. McCarthy. The development of children's concepts of causal relations, by J. M. Deutsche. Growth in intellectual ability, by F. N. Freeman and C. D. Flory. The Stanford-Binet scales for measuring intelligence, by L. M. Terman and M. A. Merrill. Intellectual development and rigidity, by J. S. Kounin. Growth of the child as a whole, by W. C. Olson and B. O. Hughes. Learning and maturation in identical infant twins, by A. Gesell and H. Thompson. The effects of preschool attendance upon intellectual development, by B. L. Wellman. Foster-family resemblances in intelligence, by B. S. Burks. Intellectual growth of children in foster homes, by M. Skodak. Mental and physical traits of a thousand gifted children, by L. M. Terman. Study of personality development, by J. W. Macfarlane. Studies of children's fears, by A. T. Jersild. Social behavior and child personality, by L. B. Murphy. Play and substitute satisfaction, by S. Escalona. The effect of barriers upon strength of motivation, by H. F. Wright. Experiments in sibling rivalry, by D. M. Levy. Clinical studies in childhood play, by E. H. Erikson. The behavior of young children in failure, by M. E. Keister. Frustration and regression, by R. G. Barker and others. Domination and socially integrative behavior, by H. H. Anderson. The "social climate" of children's groups, by R. Lippitt and R. K. White. Social behavior of preschool children, by M. Parten and S. M. Newhall. A sociometric study of emotional and social expansiveness, by H. H. Jennings. Evaluations of adolescent personality by adolescents, by C. McC. Tryon. Personality patterns in school children, by R. N. Sanford. Development in adolescence: a case study, by H. E. Jones. Child training and social class, by A. Davis. The Hopi child, by W. Dennis. Index.

Note: Each of the papers in this volume, intended for college students, is an account of the procedures, results, and conclusions of a particular investigation. Bibliographies accompany the papers.

BARKER, ROGER G., AND HERBERT F WRIGHT

Midwest and its children the psychological ecology in an American town. Evanston Row Peterson and Company 1954 532 p. illus. 24 cm. $7.50. 4987

Contents: The general problem and methods of psychologic ecology. Midwest and the U. S. A. The behavior setting survey—methods—results. Behavior and psychological habitat as targets of description. Recording behavior and psychological habitat. Dividing the behavior stream. Behavior structure. The behavior objects of Midwest. Social action and interaction—a descriptive instrument—an episode exhibit—quantitative findings. Psychological ecology of Midwest—a summary. References. Appendix. Index.

Note. A minutely detailed study of factors molding the personalities of the 119 children under 11 years of age residing in a town of 707 residents in a midwestern region of the United States of America. The research was conducted over a period of seven years and was supported by the National Institute of Mental Health and by private organizations such as the Carnegie Corporation. In studying the influences on the children, the investigators necessarily took into account a great variety of psychological, sociological, and economic factors; consequently the book is also a sociological study of the town concerned. The emphasis is, however, on the psychological aspects. Both the results of the study and their interpretation are presented in terms that suit the book to advanced students and professional social psychologists and sociologists rather than to general readers.

BETTELHEIM, BRUNO

Love is not enough the treatment of emotionally disturbed children. Glencoe, Ill. The Free Press, 1950 386 p. illus. 22 cm. $4.50 4988

Contents: The children. First encounter. Events in sequence. From dreams to waking. The in-between times. The challenge of learning. Food: the great socializer. Rest and play. Alone and in the group. The world outside. In the bathroom. Bedtime. Reflections on the school. Index.

Note: An informal account of the work and methods of the Sonia Shankman Orthogenic School at the University of Chicago. Although it deals with child psychiatry, the style is nontechnical, and the organization of the material is informal. The book can be read by anyone interested in the problems presented by delinquent, schizophrenic, or neurotic children. On the other hand, its content is substantial enough to make it valuable to child psychiatrists and others who work professionally with emotionally disturbed children.

BLAIR, ARTHUR WITT AND WILLIAM H. BURTON

Growth and development of the preadolescent. New York Appleton-Century-Crofts, Inc., 1951 221 p. 22 cm. $2 75 4989

Contents: The preadolescent—a neglected group. The changing social insights of the preadolescent. The preadolescent is subjected to strong cultural impositions. Physical growth and its relation to behavior. Intellectual development and its relation to behavior. The general characteristics of preadolescence. Guiding the development of the preadolescent. Exceptional problems. Index.

Note: A general introductory survey of the psychology of children in the age group of approximately nine through 12 years. It surveys and integrates the literature available since 1930 on this age group and organizes it for use as a textbook in college courses and other organized groups. The chapters are equipped with suggestions for reports and discussion, and with references to related literature. The book is of interest to teachers and parents as well as to students. It is written in a style that is fairly free of technical terminology.

BRECKENRIDGE MARIAN EDGAR, AND E. LEE VINCENT

Child development physical and psychologic growth through the school years. Third edition. Philadelphia W B Saunders Company 1955 497 p. illus. 24 cm. $5.00. 4990

Contents: Some general principles of development. Influences on growth—physical—emotional—nutrition and routines—home—school—church—camps—further community factors. Growth in use of the body—physical growth—motor control. Growth of sense perceptions and judgments. Development of memory, imagination, creative ability. Growth of language, thinking and reasoning. Social and personality development—general personality trends—conflict and agreement; cooperation and friendship—moral judgment and psychosexual development. Summary of growth achievements. List of films and film strips. Bibliography. Index.

Note: A successful textbook which is used in courses offered to college students preparing for such professions as psychology, teaching, medicine, nursing, and social work. Although the main emphasis is on the physical and psychologic development of children during

raphic and personality correlates in peptic ulcer by S. Rubin and K. M. Bowman. Hostility in cases of essential hypertension, by L. J Saul. III, The schizophrenic psychoses: Physiologic aspects of schizophrenic withdrawal, by A. Angyal and others. The insulin shock and metrazol treatments of schizophrenia, with emphasis on psychological aspects, by W C. Shipley and F Kant. The significance of psychological research in schizophrenia, by K. Goldstein. The Rorschach test in psychopathology by S. J Beck. Intelligence in mental disorder by A. Roe and D Shakow Transference problems in schizophrenics, by F Fromm-Reichmann. Evidences of homosexuality in one hundred and twenty unanalyzed cases with paranoid content, by G R. Gardner IV Experimental psychopathology The dynamics of the selective inhibition of specific functions in neurosis, by A. Wolf. The alteration of instinctual processes through the influence of conditioned reflexes, by H. S. Liddell. A preface to the theory of hypnotism, by R. W White. Hypnosis and the alpha activity of the electroencephalogram, by H. Lundholm and H. Löwenbach. Experimental demonstrations of the psychopathology of everyday life, by M. H. Erickson. The effect of fear upon estimates of the maliciousness of other personalities, by H. A. Murray The contributions of topological and vector psychology to psychiatry by J D Frank. Freudian mechanisms and frustration experiments, by D Rapaport. Conflict, frustration and the theory of threat, by A. H. Maslow Index.

Note. An anthology of 45 journal articles and other writings illustrative of American thought and research trends in abnormal psychology and psychosomatic medicine in the late 1930's and early 1940's. It contains 45 chapters or papers, of which a selection is listed by author and title above. For the most part the selections have been taken from contemporary professional journals and are reprinted in full.

WHITE, ROBERT W

The abnormal personality a textbook. Second edition New York The Ronald Press Company 1956 644 p 23 cm $6 50 4981

Contents Historical introduction—origins of abnormal psychology Clinical introduction—examples of disordered personalities. Development of personality Integration of personality Anxiety and defense. Neurotic conflict and its effect on personality Symptom syndromes of neurosis. Psychotherapy—basic methods and principles. —technical aids and variations. Conduct disorders. Psychosomatic disorders. Effects of injuries and abnormal conditions. Common symptom syndromes of cerebral disorder Depressive and manic disorders. Depressive and manic disorders. Schizophrenia. The problem for society Name index. Subject index.

Note A broad, well-written introduction directed to college students taking first courses in abnormal psychology The exposition is clear and the discussions of specific topics are relatively full. The author made special efforts to make the book interesting, and one of his techniques was to integrate the case histories with the exposition instead of setting them off separately in smaller type as is often done. The first edition was published in 1948. It was rather widely revised for this edition so as to incorporate advances in psychotherapy and other areas. Literature references are given to support the text and suggestions for further reading are included in the chapters. The author is a member of the faculty of Harvard University

CHILD STUDY

AMERICAN ASSOCIATION FOR GIFTED CHILDREN

The gifted child Edited by Paul Witty Boston D C Heath and Company 1951 338 p illus 23 cm $4 50 4982

Contents Progress in the education of the gifted, by P Witty Identifying gifted children, by W H. Bristow and others. The Stanford studies of the gifted, by L. M. Terman and M H. Oden. The contributions of Leta S. Hollingworth to the study of gifted children, by M. C. Pritchard. Some observations of highly gifted children, by H. Zorbaugh and others. The teacher of gifted children, by W C. Ryan and others. Mental hygiene of gifted children, by R. Strang. Community recognition of the gifted, by N Hobbs. Nature and extent of educational provisions for the gifted pupil, by P Witty A high school of science for gifted students, by M. Meister Search for talent in science, by W Davis Experiences with children talented in the arts, by A. Lally and L. Le Brant. Administrative problems in educating gifted children, by L. Krueger and others. The education of gifted children and youth—summary and recommendations, by P Witty Annotated bibliography on gifted children by E. H. Martens. Index.

Note. A book designed to inform nonspecialists such as parents, beginning teachers, and members of school boards, about current thought and problems in connection with specially gifted children. The various chapters are written for the book by recognized leaders in this field of education. The book is a nontechnical or semitechnical presentation rather than a popularization. It includes some statistical data and numerous literature references. The bibliography comprehensive.

AMES, LOUISE BATES, AND OTHERS

Child Rorschach responses developmental trends from two to ten years. By Louise Bates Ames, Janet Learned, Ruth W Métraux and Richard N Walker New York Paul B Hoeber, Inc., Medical Book Department of Harper & Brothers, 1952 310 p illus. 24 cm. $7 50 4983

Contents Part one: Review of literature. Subjects and methodology Scoring. Statistical analysis. Area. Determinants. Content. Additional test factors. Part two Two years. Two and a half years. Three years. Three and a half years. Four years. Four and a half years. Five years. Five and a half years. Six years. Seven years. Eight years. Nine years. Ten years. Normal adult record. Clinical considerations. Summary Bibliography Index.

Note: In this work, findings based upon studies of 650 children ranging in age from two to 10 years of age show the changes which occur in normal responses at each age level to the Rorschach test. It is shown also that many types of Rorschach responses which suggest disturbances in the adult may be quite characteristic in the child. The system of scoring used by the authors in evaluating the Rorschach tests is given in some detail. Methods of administering the tests to young children are mentioned, but the reader who is looking for specific instructions in testing procedure is referred to a standard text on the subject. This book is not an introductory manual on Rorschach procedure; familiarity on the part of the reader with one or more of the scoring systems is assumed. The authors are members of the staff of the Gesell Institute of Child Development.

AXLINE, VIRGINIA MAE

Play therapy, the inner dynamics of childhood, with an introduction by Carl R. Rogers. Boston Houghton Mifflin Company, 1947 379 p illus. 22 cm $4.25 4984

Contents (abridged) Part one, Introduction. Part two, The non-directive play-therapy situation and participants: The playroom and suggested materials. The child. The therapist. An indirect participant—the parent or parent-substitute. Part three, The principles of non-directive play therapy Establishing rapport. Establishing a feeling of permissiveness. Maintaining respect for the child. Therapy cannot be hurried. The value of limitations. Part four Implications for education Practical schoolroom application. Application to parent-teacher relationships. Part five, Annotated therapy records. Index.

Note A student of Carl Rogers at Chicago University the author here describes the procedures followed in the Rogers plan of play therapy to restore maladjusted children to social normalcy giving full explanations of techniques and some evaluation of successes and failures. Two basic tenets underlie the system (1) attempt should be made, not to try to correct all the forces which have caused a child's maladjustment, but to have the child accept his situation and himself and (2) in the play periods themselves, the child must be allowed to plan and execute his own activities, with supervision but not direction from the therapist. There are practical explanations of how the therapist may work to accomplish the desired ends and several fully recorded reports of play periods conducted for specific cases.

BAKER, HARRY J

Introduction to exceptional children Revised edition. New York The Macmillan Company, 1953 500 p. illus. 21 cm. $5 75 4985

Content (abridged) Part I, Introduction to the field Problems in general education. Problems of exceptional children. Part II, The physically handicapped. Defective vision. The partially seeing. The blind. Defective hearing. Defective speech. Orthopedic handicaps.

ENGLISH, HORACE BIDWELL

Child psychology New York Henry Holt and Company 1951 561 p. illus. 24 cm. $5.75 4996

Contents: Part I, Introduction. Part II, Discipline and authority. Part III, Emotion. Part IV, Motivation. Part V, The importance of physical development. Part VI, The child's intellectual life. Part VII, Social development. Part VIII, The individual child. Appendixes. Bibliography and index of authors. Index of subjects.

Note: An introductory text addressed to college students but useful also to educated parents and others with mature interests in the psychology of children. It is written in [illegible] lucid, direct style and although introductory to this branch of psychology it includes fair amount of professional grade material. There is [illegible] bibliography of over 500 references. The author is [illegible] member of the faculty of Ohio State University.

ERIKSON, ERIK HOMBURGER

Childhood and society New York W W Norton & Company Inc., 1950. 397 p. illus. 22 cm. $5.50. 4997

Contents: Part one, Childhood and the modalities of social life: Relevance and relativity in the case history. The theory of infantile sexuality. Part two, Childhood in two American Indian tribes: Hunters across the prairie. Fishermen along [illegible] salmon river. Part three, The growth of the ego: Early ego failure—Jean. Toys and reasons. Eight stages of man. Part four, Youth and the evolution of identity: Reflections on the American identity. The legend of Hitler's childhood. The legend of Maxim Gorky's youth. Conclusion—The fear of anxiety. Appendix. Index.

Note: A collection of studies in which the social significance of childhood is interpreted in the terms of psychoanalysis. They range from detailed discussions of cases from the author's practice—in some of which the role of society is not too apparent—to anthropological studies of child training in certain American Indian tribes. Relations between values and developmental stages are brought out. The book is of about equal interest to students of cultural anthropology and to psychoanalysts interested in the psychiatric difficulties of children.

FAEGRE, MARION LYON AND JOHN E. ANDERSON

Child care and training. Seventh edition revised. Minneapolis The University of Minnesota Press, 1947 310 p. illus. 21 cm. 4998

Contents: The young child. How children grow. General care, including diet and clothing. Children's diseases. How children develop mentally. How children learn. Emotional behavior. Learning good eating habits. Learning good sleeping habits. Elimination and other early habits. Constructive discipline. Curiosity, questioning, and sex education. Imagination, truth, and falsehood. Play. Social development. Books and reading. The family. Books dealing with the development and training of children. Index.

Note: A guide for parents in the care and training of children from the age of one to 1[illegible] years. The material is based on the extension courses and study groups sponsored by the University of Minnesota and upon the questions asked by parents in these courses. Psychological matters rather than physical care are emphasized, although there [illegible] considerable material on the latter. An [illegible] edition was published in 1938, 320 p., $2.00.

FAEGRE, MARION LYON

Your child from 6 to 12 Washington, D C. Government Printing Office, 1949 141 p. illus. 23 cm. (United States. Federal Security Agency Social Security Administration. Children's Bureau. Publication number 324) $0.20. 4999

Contents: What 6- to 12-year olds are like. How family life is changing today. What successful parenthood involves. How families influence their children. Social adjustment. What play means in the life of [illegible] child. Home life as preparation for independent living. Helping children to make the most of their mental ability. When home and school get together. Everyday problems. Fears, worries, frustrations, and their outlets. Some special times. [illegible] concerns. Fun, pets and hobbies. Children and money. Developing [illegible] behavior [illegible]

attitudes. Growth in middle childhood. Keeping your child healthy. The sick child. The community [illegible] services for your children.

Note: A useful, nontechnical guide for parents.

FIELDER MIRIAM FORSTER

Deaf children in a hearing world their education and adjustment. With a foreword by Mary Fisher Langmuir New York The Ronald Press Company 1952 320 p. illus. 21 cm. $5.00. 5000

Contents (abridged): Part I, Education of deaf and hard-of-hearing children. The Vassar staff asks some questions. The research program. Part II, The children. Introduction: how we studied children. Part III, The parents discuss their problems. Social relations with other children. What problems arise with siblings? Reactions of parents to their deaf children. Helping the child understand his handicap. Who is [illegible] handicapped child? Parents as teachers of their children. What does [illegible] child's hearing loss mean? Should [illegible] child wear [illegible] hearing aid? Part IV, Reports of mothers and teachers on the children's experiences. Part [illegible] Conclusions: Summary remarks. Appendix: Sources of help and information for parents of deaf and hard-of-hearing children. Index of names. Index of subjects.

Note: A discussion of the problem whether it is advisable to include deaf and hard-of-hearing children in schools and educational programs planned for boys and girls of normal hearing. It is [illegible] report of research conducted by the Vassar Summer Institute for Family and Community Living as part of [illegible] five-year program for the study of children with hearing difficulties. The author tells how [illegible] group of deaf children were received into groups with no hearing handicaps. The first of the five parts of the book explains the background of the study [illegible] its definite objects were, and how and by [illegible] it was conducted. Part II tells about the children individually; charts are included to show the hearing ability of each child. Seven mothers of the children were in residence at the Institute [illegible] while the investigation was in progress, and Part III records some of the discussions between parents and teachers of these children. The fourth and fifth parts give the reports of the mothers and teachers and the conclusion of the study.

FORD MARY

The application of the Rorschach test to young children. Minneapolis The University of Minnesota Press, 1946. 114 p. illus. 23 cm. (University of Minnesota. The Institute of Child Welfare. Monograph series. No. XXIII) $2.00 5001

Contents: Introduction. Review of the literature. The problem. Procedure. Scoring and interpretation. The subjects. The use of the Rorschach test with young children. Means of the Rorschach test determinants. Sex differences in test determinants. Reliabilities of the test determinants. Validity of the determinants of intelligence. Validity of some of the determinants of personality. Summary and conclusions. Appendices. Glossary. Bibliography. Index.

Note: An analysis for child psychologists of the responses obtained from 123 boys and girls, ages three to eight, to the Rorschach inkblots. Up to the time of its writing, very little Rorschach testing of this age group had been accomplished, due to the lack of standards for correctly interpreting results. The present book is [illegible] useful contribution towards the establishment of these standards.

GESELL, ARNOLD

Infant development the embryology of early human behavior New York Harper & Brothers 1952 108 p. illus. 24 cm. $3.50. 5002

Contents: Introduction—the concept of growth. Charting the normal growth cycle. The embryology of human behavior. The human action system in evolution. Eyes, hands, and brain. The total action system. The growth process. Individual differences and deviations. The diagnosis and supervision of development. A developmental philosophy. Appendices: General references. Collateral readings. Correlated edited films. Illustrations of principles and methods of developmental diagnosis at 28 weeks level of maturity. Index.

Note: The theme of this short book is "that there is [illegible] fundamental continuity in the prenatal and postnatal phases of human growth." It is in effect an outline, brought down to date, of the findings of the extensive researches of Dr. Gesell and his colleagues at the

the years when they normally attend elementary and secondary schools in the United States of America, development before the school years is outlined. The school years are covered in much detail. A large body of literature is cited In fact, the bibliography in this third edition contains 1021 references. The second edition was published in 1949 New matter was added to most of the chapters in preparing this third edition.

BROOKS, FOWLER DELL, AND LAURANCE F SHAFFER

Child psychology Boston Houghton Mifflin Company, 1937 600 p illus 22 cm. $5 00 4991

Contents Problems and methods of child psychology The origins of child behavior. The principles of learning. The behavior of infants. Growth in bodily size. The development of physical and motor capacities. Language. The developments of mental functions. The growth of intelligence. Emotional behavior Problems of emotional behavior among children. Motivation during childhood. Social development of children. Children's character and children's religion. Personality traits: their measurement and development. Personality adjustments of children. Child hygiene. The organization of traits. The prediction, guidance, and control of child behavior Additional references. Glossary Index.

Note. A textbook on child psychology prepared as a companion volume to Brooks' *Psychology of adolescence* Boston, 1929 and covering the first 12 years of the child's life. The literature of the subject has been organized and evaluated in an effort to produce coherent picture of the subject. The mechanisms of heredity and the prenatal and postnatal development of structure and function are treated, and those forms of activity of the child which are result of his contact with his social system are considered. Selected references are given at the end of each chapter in addition to the list at the end of the volume.

CARDWELL, VIOLA E.

Cerebral palsy, advances in understanding and care New York Association for the Aid of Crippled Children, 1956 625 p illus 24 cm. $5 00 4992

Contents (abridged) Part I, Medical background and diagnosis of cerebral palsy Etiology Central nervous system—basic concepts as related to cerebral palsy Diagnosis of cerebral palsy Part II, The individual with cerebral palsy and his total habilitation The child with cerebral palsy and his family Habilitation and the team approach. General health supervision and guidance. Orthopedic, neurological, and neurosurgical treatment. Physical medicine in the evaluation and treatment of the neuromuscular defects. Rehabilitation therapies and the neuromuscular defects—evaluation and treatment techniques. Communicative disorders—speech, hearing, and vision—evaluation and treatment. Psychological aspects of cerebral palsy Personality development of the child with cerebral palsy Special education for the child and youth with cerebral palsy Part III, Community aspects of cerebral palsy Planning a community program for the cerebral palsied. Case finding and registering. Research in the attack on cerebral palsy Programs of prevention. Appendix. References. Index.

Note. An authoritative and well-sponsored book. The material in it has been drawn from many sources, and it is designed to be useful to all who are concerned with the care and education of children suffering from cerebral palsy It is organized in the three parts whose titles are given above and in 26 chapters, the majority of which also are listed by title above. The broad scope is obvious in these titles. The "team approach, that is to say method of attack that utilizes the interests and skills of several professions, is emphasized. The book is suitable for use as a graduate-level text in courses offered to students who are preparing for professional work with cerebral palsied children, and as a reference work for educators, public health officials, physicians, nurses, and social workers. A 48-page bibliography is included. Also included is a directory of manufacturers and other sources of therapeutic equipment.

CARMICHAEL, LEONARD editor

Manual of child psychology Second edition New York John Wiley & Sons Inc. 1954 1,295 p illus. 22 cm (A Wiley publication in psychology advisory editor Herbert S Langfeld) $14 00 4993

Contents Methods of child psychology by J E. Anderson. The onset and early development of behavior by L. Carmichael. Animal infancy by R. M. Cruikshank. The neonate, by K. C. Pratt. Physical growth, by H. Thompson The ontogenesis of infant behavior by A. Gesell. Learning in children, by N L. Munn. The measurement of mental growth in childhood, by F L. Goodenough. Language development in children, by D. McCarthy The environment and mental development, by H. E. Jones. The adolescent, by J E. Horrocks. Research on primitive children, by M. Mead. Character development in children—an objective approach, by V Jones. Emotional development, by A. T Jersild. Behavior and development as function of the total situation, by K. Lewin. An addendum—the influence of topological and vector psychology upon current research in child development, by S. Escalona. Gifted children, by C. C. Miles. Psychological sex differences, by L. M. Terman and L. E. Tyler Psychopathology of childhood, by C. P. Bradley. Social development, by H. H. Anderson and G. L. Anderson. Index.

Note. In the second edition of this established work, there are the 19 comprehensive accounts of the more significant aspects of child psychology whose authors and titles are listed above. Each chapter follows, largely the pattern of delineating past researches in its own area and summarizing present points of view Particular attention is given to the experiments and investigations upon which the accumulated knowledge is based. The source articles are cited and an extensive bibliography is included in each chapter. Described by the editor as an advanced-level textbook, the book is actually a kind of cyclopedic reference tool, useful to advanced students and beginning research workers in such fields as psychology education, psychiatry and pediatrics. The first edition was published in 1946. In this second edition a former chapter on the adolescent has been replaced by new one written by new author an addendum to Lewin's chapter has been inserted, and the two terminal chapters are new Some of the chapters carried over have been extensively revised and others only slightly

COLE, LUELLA, AND JOHN J B MORGAN

Psychology of childhood and adolescence. New York Rinehart & Company, Inc., 1947 416 p. illus. 22 cm. $5 00 4994

Contents. Physical growth. Motor development. Emotional growth. Motivation. Social growth. Homes for children and adolescents. Play and interests. Intellectual growth. Bright and dull children. Language. Growth in attitudes and behavior. Personality Readings. Index.

Note. This volume is a reshaped and integrated version of two earlier books: John J B. Morgan's *Child psychology* New York, Farrar & Rinehart, 1942 and Luella Cole's *Psychology of adolescence*, New York, 1942 In its present form the book is designed for use primarily in teachers' colleges. The material is well organized and physical, emotional, social, and intellectual growth from infancy to maturity is explained in simple nontechnical language. Brief chapter summaries and selected bibliography are included.

DAVIS, W ALLISON, AND ROBERT J HAVIGHURST

Father of the man how your child gets his personality With a chapter by Helen Ross. Boston Houghton Mifflin Company 1947 245 p. 21 cm $4 00 4995

Contents (abridged) Whose temper? You'd never think they were sisters! The psychology of young child. How brothers learn to be different. How important is heredity? How much can training do? What the middle-class child is up against. The happiest days of life. The battle of cleanliness. The mystery of language. The first child against the second. Like mother like daughter? by Helen Ross. A moral child in moral society The roots of character. How to understand a child. Appendixes Social-class and color differences in practices of child-rearing. Note on psychoanalytic technique. A guide to the intensive study of a child. Index.

Note. Although addressed to parents, this book is more closely related to basic psychological and sociological research than are most popular books on child training and guidance. It was based in large part on study of child rearing as practiced by 200 mothers in Chicago, one-quarter of whom were of the white middle class, one-quarter of the white working class, one-quarter of the negro middle class, and one-quarter of the negro working class. The presentation is in style that makes it available to all literate parents. There are no tables of data or any of the other customary features of sociological studies.

[illegible] schoolmates, and society [illegible] the mentally gifted, the mentally handicapped, and the physically handicapped. Also covered are the special provisions essential for the education and training of each type. The importance [illegible] emphasized of the attitudes of those who are concerned with the upbringing of such children towards the superiority or the defect. References for further reading appear at the ends of the chapters.

GRUENBERG, SIDONIE MATSNER, AND OTHERS, editors

Our children today: a guide to their needs from infancy through adolescence. Edited by Sidonie Matsner Gruenberg and the staff of the Child Study Association of America. With an introduction by Dorothy Canfield Fisher New York The Viking Press, 1955 366 p. 22 cm. $3.95 5008

Contents: I, Our children today: Changing patterns of family living, by S. M. Gruenberg. A look at children in the U.S.A., by L. [illegible]. What [illegible] child is born with, by B. C. Gruenberg. II, The early years: The child as [illegible] growing organism, by A. Gesell. Emotional needs of the young child, by H. Ross. The beginning of education, by J. L. Hymes, Jr. Nursery-school education—its uses and dangers, by A. Freud. Healthy attitudes toward health, by S. M. Wishik. III, The meaning of discipline: Character building in children, by A. Gesell. Punishment in the early years, by M. J. E. Senn. Discipline—means and ends, by M. F. [illegible]. The child's [illegible] freedom, by L. S. Kubie. Shall we [illegible]? IV, Growing up: Problems the parents? by A. W. M. Wolf. Growing to [illegible]—what makes them tick? by F. Redl. Growing to adulthood, by I. M. Josselyn. Youth in the world tomorrow, by G. Vincent. The concept of maturity, by C. Kluger. When children need special help with emotional problems, by A. R. Auerbach. Sex education today, by the staff of the Child Study Association of America. V, Changing goals of education: Families and schools, by L. K. Frank. What can we tell? by M. Krugman. Social and economic factors in learning, by W. A. Davis. The changing role of education, by E. O. McCoy. VI, The impact of our world: [illegible] are exposed, by D. Krech. The toll of [illegible] upon the intellect, by D. M. Levy. New era of communication, by J. Frank. Childhood and spiritual values, by A. L. Smith, Jr. At home in the world, by P. S. Buck. For further reading. Index.

Note: An authoritative compendium addressed to parents. Several of its chapters have appeared in periodicals and other books, but the majority of them were written especially for it. As the chapter titles show, background information on emotional needs, discipline, child psychology, education and living in [illegible] community is presented rather than advice on day-to-day care.

HAMILTON, GORDON

Psychotherapy in child guidance. New York Columbia University Press 1947 340 p. 22 cm. $4.25 5009

Contents: Clinically oriented social casework. The diagnostic process in child guidance. The child who acts out his impulses. The anxious child. The severely disturbed child. Direct treatment in the therapeutic process. The therapeutically conditioned environment. Treatment of young children. Treatment of the older child. Treatment of adolescents. Treatment of the family. Preparation for psychotherapy in social work. Bibliography. Index.

Note: For [illegible] number of years the Jewish Board of Guardians of New York has conducted [illegible] child guidance program in which social workers participate in the role of psychotherapists. This book is [illegible] study of the program from the standpoint of its procedures and general applicability. Attempt is made to state in what way psychotherapy is related to social casework and to determine [illegible] whether it may be practiced appropriately in [illegible] social work rather than [illegible] medical setting.

HARMS, ERNEST, editor

Handbook of child guidance. New York Child Care Publications, 1947 751 p. 24 cm. $8.60. 5010

Contents (abridged): Part one, The development of child guidance in the United States, by B. Glueck. Part two, Guidance of the normal child. Guidance of the nursery age child, by L. F. Woodcock. Guidance of the elementary school age, by E. R. Wiring. Guidance in secondary schools, by C. E. Erickson. Guidance of the superior child and the prodigy, by E. Harms. Part three, Guidance of the physically handicapped child, by H. W. McCormick and L. C. Dunyon. Part four, Guidance of the problem and subnormal child: First section—the medical aspects of guidance of the problem and subnormal child. Second section—the methods of guidance of the problem and subnormal child. Part five, Training for child guidance: The training of the medical man in child psychiatry, by G. H. J. Pearson. The training of the psychiatrist in child guidance, by L. Kanner. The training of the social worker for child guidance, by C. Towle. Part six, The social aspects of child guidance. Parents and child guidance, by J. E. Bentley. City and rural guidance, by M. M. Chambers. Sex guidance, by F. McKinney. Delinquency and guidance, by J. Punke. Vocational guidance, by F. J. Keller. Camping and guidance, by P. S. DeQ. Cabot. The guidance problems of Negro youth, by C. S. Johnson. Special guidance problems [illegible] migrant children, by L. C. Wagner. Part seven, Religious aspects of guidance. Part eight, Special viewpoints for guidance. Freud's psychoanalytic viewpoint for child guidance, by M. M. Schmideberg. Alfred Adler's viewpoint on child guidance, by A. Adler. Index.

Note: Including forty-odd papers by as many different authors, this volume constitutes [illegible] comprehensive survey of the many phases of child guidance recognized by present-day specialists. With [illegible] very few exceptions, the papers are representative, primarily of points of view, and are not outlines of procedural techniques; unfortunately the contributors are identified by name only with no indication of professional status. The volume should be of interest to many parents, although it will be of service primarily to such professional groups as educators, pediatricians, and all social and religious workers associated with children. A list of selected references follows most of the chapters.

HURLOCK, ELIZABETH B

Child development. Third edition. New York McGraw Hill Book Company Inc., 1956 703 p. illus. 23 cm. (McGraw Hill series in psychology Clifford T Morgan, consulting editor) $6.50 5011

Contents: Principles of development. Prenatal development. The newborn infant. Physical growth. Motor development. Development of speech. Emotional development. Social development—adjustments. Play. Development of understanding. Moral development. Some childhood interests. Family relationships. Personality. Bibliography. Visual bibliography. Name index. Subject index.

Note: A well-organized, inclusive study of the physical and psychological growth of children from conception to puberty. It is designed for use as [illegible] textbook in college courses, and its wide scope makes it useful also to groups of parents, pediatricians, and others who need [illegible] broad survey of the high points and [illegible] guide to the important research literature. The second edition was published in 1950. In this third edition, although the chapter titles are essentially the same, the book has been completely rewritten. It is now based largely on the research literature of the decade 1945–1955, although references to the older basic studies have been retained. The bibliography runs to 103 closely printed pages. The name index includes the names of authors of cited literature.

HURLOCK, ELIZABETH B

Child growth and development. Second edition. New York McGraw Hill Book Company Inc. 1956 384 p. illus. 21 cm. $5.56. 5012

Contents: Introduction: How to be [illegible] good baby sitter. Part I, How life begins. Preparing for the baby. The newborn baby. Facts about children. Part II, The child's growth: How [illegible] child grows. Feeding and clothing the child. Physical care of the child. Learning body control. Learning to talk. The child and his emotions. Part III, The child's problems and habits: Mealtime and bedtime problems. The child in the family. Common behavior problems. Discipline, good and bad. Tests for toddlers. Play and playthings. Part IV, The child as [illegible] person. The child's companions. A place of his own. The child and his clothes. Personality building. Getting ready for school. Bibliography for students—for teachers—for tests in Chapter 14. List of visual aids. Index.

Note: An elementary and practical book addressed to high school students and to parents. It describes in some detail the pattern of growth and psychological development in young children and correlates this knowledge with techniques of child care in the home. It [illegible] illustrated with [illegible] large number of attractive photographs. The three bibliographies are unusual features in [illegible] book at this level.

former Clinic of Child Development of Yale University and the currently active Gesell Institute of Child Development. The human child is shown to be continuously developing organism in long and precise cycle of physical, mental, and functional growth. A series of outstanding photographs of infant behavior—taken from the film "The embryology of development"—which show distinct points in the growth cycle are included. The book can be read as preparation for viewing the film or independently as an orientation toward the current knowledge of the field.

GESELL, ARNOLD

Studies in child development. New York Harper & Brothers, 1948 234 p illus. 25 cm $4 00 5003

Contents (abridged): Part one, Methods of approach Charles Darwin and the study of child development. A biological psychology The method of co-twin control. The conditioned reflex and the psychiatry of infancy The documentation of infant behavior in relation to cultural anthropology Cinemanalysis—a behavior research technique. One-way-vision. Part two, Patterns of growth: The predictiveness of infant behavior. Some observations of developmental stability Early evidences of individuality Genius, giftedness and growth. Part three, Clinical and social applications: The changing status of the pre-school child. A guidance program for the handicapped pre-school child. A method of developmental diagnosis and supervision. The differential diagnosis of developmental defects. Developmental pediatrics its task and possibilities. The cultural significance of a science of child development.

Note A collection of papers originally prepared by the author for various special occasions. As the titles indicate, they deal with the characteristics and conditions of child development in both its scientific and humanitarian aspects. Although of principal importance to child psychologists and pediatricians, the volume contains much of interest for enlightened parents also. Selected references accompany some of the chapters. The author is widely known both for his writings in this field and for his work as Research Consultant of the Clinic of Child Development, School of Medicine, Yale University

GESELL, ARNOLD, AND FRANCES L ILG

The child from five to ten New York Harper & Brothers, 1946 475 p. illus. 24 cm. $4 50 5004

Contents. Part one, Growth: The cycle of development. The growing mind. The parent-child-teacher relationship. Part two, The growing child The first four years. Five years old. Six years old. Seven years old. Eight years old. Nine years old. Ten. Part three, The growth complex Orientation. Motor characteristics. Personal hygiene. Emotional expression. Fears and dreams. Self and sex. Interpersonal relations. Play and pastimes. School life. Ethical sense. Philosophic outlook. A philosophic postscript. References and readings. Index.

Note This companion volume to the authors' *Infant and child in the culture of today* New York, 1943 is written primarily for parents, teachers, physicians, and others responsible for the training of children. Based on an intensive study of more than 50 children, ranging in age from five to 10 years, it presents an over-all picture of their traits and growth patterns. Ten fields of behavior have been chosen within which the child is described or characterized, first from the standpoint of age, and secondly from the standpoint of the behavior itself Although the method of approach is strictly clinical, the statistical data are interpreted in such a manner as to make the work readily intelligible to nonspecialists. A four-page bibliography is included.

GESELL, ARNOLD, AND FRANCES L ILG

Infant and child in the culture of today, the guidance of development in home and nursery school (from the former Clinic of Child Development School of Medicine at Yale University) In collaboration with Louise B Ames Jeanette Learned New York Harper & Brothers 1953 403 p 24 cm. illus $4 50 5005

Contents Part I, Growth and culture The family in democratic culture. How the mind grows. Personality and acculturation. Infants are individuals. Self-regulation and cultural guidance. The cycle of child development. Part II, The growing child: Before the baby is born. A good start. Four weeks old. Sixteen weeks old. Twenty-eight weeks old. Forty weeks old. One year old. Fifteen months old. Eighteen months old. T years old. Two-and-a-half years old. Three years old. Four years old. Fi and the years after five. The nursery school as guidance center Part three The guidance of growth. A developmental philosophy The growth complex. Child development and the culture of tomorrow Appendix. Index.

Note Addressed both to nursery school teachers and parents, the book provides basic information on the development of infants and young children. It is primarily a description of but the young child is like at various ages and how he develops. However, specific recommendations on management are included also. Much of the space is devoted to the "behavior profiles of the various ages hich are named in the chapter titles of the second part. The book was based in large part on the researches of the authors at Yale University

GESELL, ARNOLD, AND OTHERS

Youth, the years from ten to sixteen. By Arnold Gesell, Frances L. Ilg, Louise Bates Ames From the Gesell Institute of Child Development and from the Yale Clinic of Child Development. New York Harper and Brothers, 1956 542 p 24 cm. $5 95 5006

Contents. Part I, The study in outline: Orientation. Development—a key concept. Individuality Part II, Maturity profiles and traits. Year ten. Year eleven. Year twelve. Year thirteen. Year fourteen. Year fifteen. Year sixteen. Part III, Maturity trends and growth gradients: Total action system. Self-care and routines. Emotions. The growing self. Interpersonal relationships. Activities and interests. School life. Ethical sense. Philosophic outlook. Appendixes. Subjects and methods. Age standards and eligibilities. Readings and references. Index.

Note. One of trinity of books which includes in addition to the present title *Infant and child in the culture of today* 1943, and *The child from five to ten*, described above. The children studied for the present work included many of those ho at earlier ages ere the subject of the studies presented in the first two books of the series. Personality traits, habits and attitudes are described in detail in the chapters entitled "Year ten, "Year eleven, etc. The traits of each age group are described under the heading "Maturity traits, and such subheadings as Physical development and sex awareness, "Self-care and routines, "Emotions, "The growing self "Interpersonal relationships, Activities and interests" and "Ethical sense.

GOODENOUGH, FLORENCE L

Exceptional children. By Florence L. Goodenough with the assistance of Lois M Rynkiewicz. New York Appleton Century-Crofts, Inc., 1956 428 p illus. 22 cm (The Century psychology series Richard M Elliott, editor) $4 50 5007

Contents Part I, General Introduction. Dimensions of the personality Special needs f exceptional children. Methods of classification and measurement. Further problems of classification. Part II, Superior deviates: Fundamental concepts. The exceptionally intelligent child—general characteristics. The personal adjustment and social relations of highly intelligent children. The education of exceptionally intelligent children. The adult achievements of gifted children. Manifestations of special talent in childhood. Part III, The intellectually inadequate The nature of intellectual inadequacy The causes of intellectual inadequacy Attempts to remedy mental retardation. The feeble-minded child in home, school and community The education and training of subnormal children. The mentally deficient child grows up. Part IV Marked inconsistencies of development The patterning of aptitudes and achievements. Specialized educational inconsistencies. Stuttering or stammering. Speech defects other than stuttering. Part The physically handicapped child. Children with sensory handicaps The blind. The partially sighted. The deaf The hard-of-hearing The child with cerebral palsy The brain-damaged child The postencephalitic child. The child with epilepsy The child with other physical handicaps. Multiple handicaps. Part VI, The deviate and social program. Science and the deviate. The deviate and social welfare. Name index. Subject index.

Note. A textbook for college students in education, psychology, or social welfare and reference book for parents, teachers, and others concerned with children. Three main types of exceptional children are differentiated and described and their relations to their

MEAD MARGARET, AND MARTHA WOLFENSTEIN editors

Childhood in contemporary cultures. Chicago University of Chicago Press, 1955 473 p. illus. 24 cm. $7 50 5019

Contents. Part I, Cultural approaches to the study of childhood. Theoretical setting—1954, by M. Mead. Continuities and discontinuities in cultural conditioning—1938, by R. Benedict. Theoretical approach—1941, by G. Gorer. Part II, Observational studies: Children and ritual in Bali, by M. Mead. Balinese children's drawing, by J. Belo. Children and music in Bali, by Colin McPhee. Balinese bibliography. French parents take their children to the park, by M. Wolfenstein. The place of book-learning in traditional Jewish culture, by M. Zborowski. Part III, Child-rearing literature: Early nineteenth-century American literature on child rearing, by R. Sunley. Fun morality—an analysis of recent American child-training literature, by M. Wolfenstein. Child-training ideals in a postrevolutionary context: Soviet Russia, by M. Mead and E. Calas. Parents and children—an analysis of contemporary German child-care and youth-guidance literature, by R. Métraux. Part IV, Fantasies for and about children: "Totis," a modern cautionary tale, by D. [illegible]. "Jack and the beanstalk," an American version, by M. Wolfenstein. "Monkey," a Chinese children's classic. A portrait of the family in German juvenile fiction, by R. Métraux. The image of the child in contemporary films, by M. Wolfenstein. Part V, Children's imaginative productions: French children's paintings, by M. Wolfenstein. The consequences of wrongdoing—an analysis of story completions by German children, by R. Métraux. Sex differences in the play configurations of American pre-adolescents, by E. H. Erikson. Part VI, Interviews with parents and children: Some variants in moral training of children, by M. Wolfenstein. Differential patterns of social outlook and personality in family and children, by E. Frenkel-Brunswik. Part VII, Clinical studies: French and American children as seen by a French child analyst, by F. Dolto. Two types of Jewish mothers, by M. Wolfenstein. Part VIII, Epilogue. Implications of insight—I, by M. Wolfenstein; —II, by M. Mead. Index.

Note: The world-wide scope of this volume is apparent in the titles of the individual studies which are listed above. The collection is, in part, a product of the Columbia Research in Contemporary Cultures and of the American Museum of Natural History Studies in Contemporary Cultures. The studies were conducted from an approach that combined anthropology, psychology and psychoanalysis. The book is a unique contribution to the study of patterns of child-rearing, and by extension to the study of national character. Literature references are included in all of the studies.

MERRILL, MAUD AMANDA

Problems of child delinquency New York Houghton Mifflin Company 1947 403 p. illus. 26 cm. $4.50 5020

Contents: Problems of delinquent behavior. Understanding the delinquent. Social frames of reference. "Toward school with heavy looks." Personality and problems of adjustment. The intelligence of delinquents. Motivation. Private worlds. Interests and attitudes. Factors in after-treatment adjustment. Summary. Bibliography. Appendices. Index.

Note. This book is both a report of a careful socio-psychological study of a group of delinquent children and a general treatise on delinquency. It is based on a study of 300 children brought before a California juvenile court during the years 1931–1935, and on a similar study of a group of nondelinquent children. It is intended primarily for psychology students, but the form of presentation and the readable style make it equally valuable to teachers, social workers, and others concerned with the problems of child delinquency. Statistical data have been segregated in the appendices.

MERRY FRIEDA KIEFER, AND RALPH VICKERS MERRY

The first two decades of life. A revision and extension of *From infancy to adolescence*. Under the editorship of Gardner Murphy New York Harper & Brothers 1950 600 p. illus. 22 cm. $4.50. 5021

Contents: How we study children and adolescents. How we begin life. How we grow before and after birth. How our body structure and functions develop. How motor abilities develop. How language develops. How intelligent behavior develops. How we learn. How we gain emotional maturity. How we develop socially. How personality develops. Growth of character and religious experience. Interests in reading, radio, and movies. Creative activities. Author index. Subject index.

Note. An introductory presentation designed principally for use as a textbook in courses offered in teachers' colleges. The style is more technical and the content more advanced than in books written primarily for parents. Also, the text is heavily documented with references to the literature. The book is a thorough revision and expansion of the authors' *From infancy to adolescence* (1940)

MUSSEN PAUL HENRY AND JOHN JANEWAY CONGER

Child development and personality New York Harper & Brothers, 1956 569 p. illus. 24 cm. $6 00. 5022

Contents: Introduction. Part I, The prenatal period: Genetic factors in development. Prenatal development. Part II, The first two years: Biological changes in the first year. Learning. Social learning in the first year. Development and social learning in the second year. Part III, The preschool years: Personality development in the preschool years. Changing social relationships in the preschool years. Part IV, Middle childhood: Personality development during the middle childhood years. Adjustment to school. The middle childhood years—adjustment to peers. Part V, Adolescence: Physical development in adolescence. Adolescent adjustment in American culture. Index of names. Index of subjects.

Note: An attractive and readable college textbook. It presents the accumulated basic knowledge on the development of behavior and personality from the prenatal period to adolescence. References are incorporated to the basic research studies and to related books suggested for further reading. The authors are members of the faculty of the University of California and of the University of Colorado.

MYKLEBUST, HELMER R.

Your deaf child a guide for parents. With a foreword by Hallowell Davis. Springfield Ill. Charles C Thomas, 1950 133 p. illus. 22 cm. (American lecture series. Publication number 94 a monograph in American lectures in otolaryngology edited by Norton Canfield) $3.00 5023

Contents: What deafness means to you. Causes and types of deafness. Your attitudes and what they mean. The deaf child and his needs. Learning to care for himself. Learning to communicate. What to expect from your child. Organizations which can help—reading materials—directory of schools. Index.

Note: A practical and reliable book in which the general and particular problems of managing deaf children in the home are discussed specifically and sympathetically. It is useful not only for help on problems directly related to deafness but also for collateral matters such as discipline and toilet training. The author is Director of the Children's Hearing Clinic of Northwestern University

PLANT JAMES STUART

The envelope study of the impact of the world upon the child. Cambridge, Mass. Harvard University Press, 1950. 299 p. 23 cm. $3.00 5024

Contents: Introduction. Security. Authority. Status preservation. The feeling of difference. Symbolization and reality. Cadence. Integration in the sense of self-sufficiency. Integration in the sense of cohesion. Physical expression of the sexual urge. The language values of sexual expression. Temperament. Reaction to failure. Minority race problems. Adequacy. Intelligence. Emotional development—dependence—seclusion—homosexuality—heterosexuality. Sibling rivalry. Personality differences. Some other problems. The meaning of meaning. Appendix. References. Index.

Note: This book complements and to some extent supersedes the author's *Personality and the culture pattern*, New York, 1937. Like the earlier work, it is a thoughtful analysis of the influences of the social environment upon the development of the individual personality in children, especially adolescents. The author's viewpoint (expressed in his own words) was that "normally the personality has the ability to shut out large sectors of its environment and to

Ilg, Frances L, and Louise Bates Ames

Child behavior New York Harper & Brothers, 1955 364 p 22 cm $3 95 5013

Contents Forward by A. Gesell. Part I How behavior grows. Ages and stages. Individuality Part II Eating behavior. Sleeping and dreams. Elimination. Tensional outlets. Fears. Intelligence and retardation. Sex behavior and sex interests. Mother-child relationship. Father-child relationship. Brothers and sisters. Comics, television and movies. School. The ethical sense. Part III What to tell about Santa Claus, Deity death, adoption, divorce. What to do about discipline. Postscript references. Index.

Note A book for parents of children up to 10 years of age, ritten in straight forward, nontechnical language by two child specialists on the staff of the Gesell Institute of Child Development. In places, the book incorporates and adapts material which appeared in syndicated newspaper column by the authors beginning in 1951 In other places, it is based on questions raised by parents and answered by the authors on an unrehearsed television series beginning in 1952 With this background, the authors give the subject a concrete treatment which should be helpful to parents who wish either to know what specific problems and anxieties they should expect to face or to find suggestions for handling immediate problems that may arise.

Jersild, Arthur T

Child psychology Fourth edition Englewood Cliffs, N J Prentice Hall, Inc., 1954 676 p illus 22 cm $6 75 5014

Contents A child is born. Nature and course of human growth. Beginnings of behavior and personal experience. Aspects of living and learning in infancy Motor development. Selfhood and social relationships. Development of social behavior Emotional development—affection, joy humor sex—fear and anxiety—anger and hostility Language development. The growth of understanding—early awareness, alertness, and remembering—reasoning, concept formation self awareness. Children's make-believe, dreams, and other imaginative activities. Children interests and play activities. Children s ideals, morals, and religion. The growth and prediction of intelligence. Personality problems and the search for self. Author index. Subject index.

Note. A standard and widely used college textbook, the first edition of which was published in 1933 and the third edition in 1947 Although several of the chapters bear essentially the same titles as in the third edition, the book has been extensively reorganized and revised in this fourth edition. Fundamental changes were made, particularly in the introduction of the concept f the self Among the important additions are the chapters on selfhood, social relationships and social behavior However the concept of the self turns up in other chapters also. The book still provides elementary but full expositions of motivation and behavior development from infancy through early adolescence The bibliography is 40 pages long and contains references to literature published as recently as 1953 The author is Professor of Education in Teachers College f Columbia University

Kent, Grace Helen

Mental tests in clinics for children. New York D Van Nostrand Company, Inc., 1950 180 p 24 cm. (Textbooks on psychology, J P Guilford general editor) $2 45 5015

Contents Why children are referred to the clinic. The clinical examination. Sources of error in use of tests. The composite scale versus the battery Language and performance tests, with and without timing. Use of unstandardized tests. The psychological report. Criteria for construction of clinical tests. Serviceable scales and subtests. Home manufacture of materials. Appendices. Bibliography Index.

Note: A book based on extensive clinical experience. The author is critical of the use of the intelligence quotient (IQ) as sole measuring stick and argues for the use of battery of tests that will provide several different and complementary scores. Against the background of this conviction, she describes and evaluates various types of tests. Much practical information on the conducting of examinations is included. There is bibliography of 170 references.

Levy, David Mordecai

Maternal overprotection. New York Columbia University *Press*, 1943 417 p. 23 cm. $5 00 5016

Contents. Foreword, Aims and methods. Case sifting. Excessive contact. Infantilization. Prevention of social maturity Maternal control. Maternal and paternal factors. Problems of the overprotected. Treatment, prognosis, psychopathology Case studies of treatment and follow-up. Appendix. Case summaries. Index.

Note. This volume contains studies which were made possible by the resources, records, and personnel of the former Institute for Child Guidance in New York City They comprise medical, social, psychometric, and psychiatric investigations whose primary aim is to show the influence of the mother upon emotional and intellectual life from infancy to maturity The book is intended for psychiatrists, pediatricians, social workers, teachers, and others concerned ith child guidance. Many tables and case records are included. The studies originally appeared in *Psychiatry* the quarterly publication of The William Alanson White Psychiatric Foundation.

Louttit, Chauncey McKinley

Clinical psychology of children s behavior problems Revised edition New York Harper & Brothers, 1947 661 p illus. 21 cm. $5 00 5017

Contents Part I, Methods Introduction. The nature of problem behavior Diagnostic methods: anamnesis and examination. Diagnostic methods: psychometrics. Treatment procedures. Part II, Problems correlated with abilities. Mental deficiency or feeblemindedness. School retardation. Specific disabilities in school subjects. Superior mental ability Part III, Primary behavior problems: Conduct problems. Juvenile delinquency Speech defects. Personality problems. Part IV Problems correlated with organic disabilities Sensory defects. Neurological and physical disabilities. Subject index. Name index.

Note. The behavior problems encountered in clinical psychological ork with children are discussed authoritatively and in considerable detail in this book. Diagnosis and treatment are dealt with from the standpoint of practical work in behavior clinics. Particular stress is laid upon the necessity for considering the patient as a hole, with all his family neighborhood, and school background, along with his physical condition. Case histories and statistical tables appear throughout the volume, and the chapters include fairly extensive bibliographies. The third edition, re-titled *Clinical psychology of exceptional children* was published in 1957 573 p., $6 00.

Martin, William E, and Celia Burns Stendler

Child development the process of growing up in society Under the editorship of Willard B Spalding New York Harcourt, Brace and Company 1953 519 p. illus. 22 cm. $7 00 5018

Contents Part I, The child The child as human being. Principles of growth and development. Spurs to activity Constitutional differences among children. The beginnings of life. Part II, Society and culture The meaning of society and culture. Culture, personality and socialization. Growing up in our society Part III, Socialization The goals of socialization. A description of socialization. Socialization from a psychoanalytic point of view Socialization from a socio-psychological point of iew Part IV Socializing agents. The child in the family The child in school. The peer group. The child in the community Bibliographical index. Subject index.

Note. Primarily textbook for college students, particularly for students who are preparing for careers in teaching, this book is also of alue to parents. It presents an inclusive iew of child development with emphasis on the social factors. It is written in a style that is easy to read and the reader's interest is stimulated by the inclusion of anecdotes, case histories and few cartoons. The text is carefully documented, and the "bibliographical index" is 13 pages long. The authors are Professors of Education at the University of Illinois.

preschool period. The family's daily routine and the child's diet. Study and guidance of preschool children. Part four, The primary period: Development during years six, seven, and eight. Problems of the primary period. Child study and guidance. Part five, From the primary period to adolescence: Learning in the preadolescent period. Special problems of preadolescents. Part six, The adolescent years. Index of names. Index of subjects.

Note: An established book which is extensively used as a text book for college courses, a guide for study groups composed of parents, and a reference manual for individual parents and teachers. It presents an over-all survey of the subject with emphasis on the applied aspects. Each aspect of how children six to eight years old learn are discussed at considerable length. The previous edition appeared in 1938. The present edition represents a very extensive revision.

Strauss, Alfred A., and Laura E Lehtinen

Psychopathology and education of the brain-injured child. New York Grune & Stratton, 1947 206 p. illus. 24 cm. $6.00. 5032

Contents: Part I, Psychopathology: Historical review of problems pertaining to the concept of brain-injured children and their education. Remarks on the anatomy of the brain and its function. Perception and perceptual disturbances of brain-injured children. Thinking disorders in brain-injured children. Behavior disorders in brain-injured children. Testing the brain-injured child. Clinic and diagnosis of brain injury in children. The concept of the exogenous child versus the endogenous child. Part II, Education: General principles in the education of the brain-injured child. Teaching arithmetic fundamentals to brain-injured children. Teaching reading to brain-injured children. Teaching writing to brain-injured children. Appendix: A brain-injured deaf child. References. Index.

—— Volume II. Progress in theory and clinic. By Alfred A. Strauss and Newell C. Kephart, in collaboration with Laura E. Lehtinen and Samuel Goldenberg Drawings by Caspar Henselmann. New York Grune & Stratton, 1955 266 p. illus. 24 cm. $7.00 5033

Contents: Anatomy and physiology of the central nervous system and brain injury in children. Embryology and brain injury. Psychopathology of perception—language—concept formation—behavior. Testing the brain-injured child with normal I.Q. by S. Goldenberg. Preliminary conclusions affecting education of brain-injured children, by L. E. Lehtinen. Essays on mental functioning of brain-injured children. Appendixes: Scoring guide to the marble board test and the Ellis design test, by S. Goldenberg. Case histories of brain-injured children with normal I.Q., by L. E. Lehtinen. References. Index.

Note: The first of these books is widely recognized as a handbook in the study of children whose intelligence and behavior is deviant due to brain injuries. It was based on 20 years of research and experience, part of it at the Wayne County Training School of Northville, Michigan, and part in the Cove Schools for Brain-injured Children in Racine, Wisconsin. Approximately half of this volume is devoted to the psychopathology of such children and the other half to principles and techniques of teaching them. The second volume is complementary to the first. It covers advances in the knowledge of the anatomy and physiology of brain injury, progress in understanding the associated psychology and developments in techniques of testing brain-injured children. In both books a number of illustrated case histories are included. The second volume contains an extensive list of literature references.

Teagarden, Florence Mabel

Child psychology for professional workers. Revised edition. New York Prentice-Hall Inc. 1946. 613 p. illus. 24 cm. $5 75 5034

Contents: Heredity. The principles of heredity as applied to the case load. Getting the child into the world. Infancy. The preschool child. Some fundamental physical habits. The child and his home. The child away from his own home. Adoption. The child's emotions. The sex life of the child. The child' intelligence. The child and his school. Behavior difficulties. Psychological and social problems incident to certain diseases of children. Children with visual and auditory handicaps. Speech defective and crippled children. The children's charter. Index.

Note: Although designed primarily for professional social workers, this volume has value as a college text. In addition to purely psychological problems, the effects of hereditary environment, and diseases on the child's conduct and personality are considered. This edition has been enlarged by the inclusion of new illustrative material based on the author's clinical experience, and the extensive chapter bibliographies have been augmented by nearly 700 references published since 1940.

Templin, Mildred C

The development of reasoning in children with normal and defective hearing. Minneapolis The University of Minnesota Press, 1950 143 p. illus. 24 cm. (University of Minnesota. The Institute of Child Welfare Monograph series. No. XXIV) $3.00 5035

Contents: Introduction. The experiment. Analysis of reasoning by matched group technique. Comparison of the reasoning of the hearing and defective hearing subsamples. Intercomparison of the reasoning within the experimental groups. Written language used in explanation of the Deutsche questions. The defective hearing. Summary. Bibliography. Index.

Note: The report of a study whose purpose is explained thus by the author: "The present study was designed to explore the effect upon reasoning of the restriction of experience by an intrinsic factor and by an extrinsic factor. The intrinsic factor selected for this study was the reduction of hearing acuity. The extrinsic factor selected was the reduction of the breadth and complexity of the environment through residence in an institution." Tests were made of 830 children in elementary and high school grades five through 12. These comprised: "(a) 273 day school hearing subjects, whose environment was restricted by neither the extrinsic nor the intrinsic factor; (b) 293 residential hearing subjects, whose environment was restricted only by the extrinsic factor; ( ) 108 day school defective hearing subjects, for whom only the intrinsic restricting factor was present, and (d) 177 residential defective hearing subjects, whose environment was restricted by both the extrinsic and intrinsic factors." The methodology of the study is described and the results are presented for the use of such professionals as educators and psychologists, especially those who are concerned with the training of handicapped children.

Thompson George Greene

Child psychology growth trends in psychological adjustment. Boston Houghton Mifflin Company Inc., 1952 667 p. illus. 22 cm. $6.25 5036

Contents: Studying the child's behavior and development. The new-born infant. Maturation a basic process in behavioral change. Psychological adjustment: some general principles. Sensory and perceptual development. The development of motor abilities. Developmental trends in emotional behavior. Language development. The meaning and measurement of intellectual development. Developmental trends in social behavior. Guiding the social development of children. The development of personal and social values. Developmental trends in personality. Index.

Note: This is a scholarly contribution to the general textbooks in child psychology. The average undergraduate with no more than one general psychology course as preparation may find it somewhat difficult going, but more mature students will find it an exceedingly useful reference. The material on social development is particularly good. Graphic and tabular material have been well chosen and particularly well reproduced.

Thorpe Louis P

Child psychology and development. Second edition. New York The Ronald Press Company 1955 709 p. illus. 21 cm. $6.00 5037

Contents: How to study children. What the child inherits. Early postnatal life. Physical growth and health. The development of motor abilities. Mental abilities and intelligence. The language and thought of the child. Children's play and interests. Emotional factors in development. Personality and character formation of the child. Parent-child relationships. Social education of the child. Mental hygiene of the child. Psychosexual development. School and the learning process. Characteristics of exceptional children. The evaluation of child development. Index of names. Index of subjects.

translate those parts that it takes in into usable or understandable material. It is the part of the personality where this occurs that I call the envelope. He describes how personality is molded but offers no rigid conclusions about how the processes should be altered or changed. The treatment is on professional level, and the book is organized and written so as to make it understandable not only to psychiatrists but also to psychologists, social workers, and educated laymen.

RIBBLE, MARGARETHA ANTOINETTE
The personality of the young child an introduction for puzzled parents New York Columbia University Press, 1955 126 p 21 cm $2 75 5025

Contents Getting perspective. Early sexual development. Privacy Aggression and the muscular system. The beginnings of self Love and hate. The roots of character Child and parent (in retrospect) Books for further reading.

Note Written in nontechnical style, this small book is a helpful guide for parents in family psychological relationships. The viewpoint is Freudian, but the book contains few of the terms of psychoanalysis. It deals frankly but in the common language with the sexual aspects of parental relationships in relation to the young child, with the roots of such personality traits as aggressiveness, with the child's need for privacy and above all with his need for reassuring affection. The age-span covered is approximately from the time the child begins to walk until he is ready for school. The book is complementary to the author' *The rights of infants*, described below

RIBBLE MARGARETHA ANTOINETTE
The rights of infants, early psychological needs and their satisfaction. New York Columbia University Press, 1943 118 p illus 22 cm $2 25 5026

Content The right to a mother Oxygen hunger Sucking. Learning to feel. Sleep. Premental behavior Some facts about elimination. Lif rhythms and artificial schedules. Babies must not be thwarted. Early emotional development. Getting ready to think. Fathers. Toward mental health. Bibliography Index.

Note. The purpose of this book is to discuss vital aspect of infant care hich is not covered in the manuals dealing with food and hygiene—the human impulses which get their initial momentum in the primary relationships between the child and the mother. Many years of observation form the background for this study but the author has succeeded in making it readable and interesting to the general reader as ell as to the specialist in child development.

SLAVSON, SAMUEL RICHARD
Child psychotherapy New York Columbia University Press 1952 332 p 24 cm. $4 50 5027

Content (*abridged*) Part one, Development Normal needs in child development Part two, Psychopathology Pathogenic factors in childhood. The pathogenesis in interpersonal relations. Clinical approaches to child psychotherapy Part three, Psychotherapy The dynamics of psychotherapy The psychotherapist in reality and phantasy Psychotherapy and therapeutic guidance of parents. Group psychotherapy with children Treatment of neurotic nine-year-old boy ith organic deficiency (case study) Index.

Not Discussions of the principles and of the techniques of group treatment of emotionally disturbed and socially maladjusted children under 12 years of age form the main content of this treatise. However it is not limited to descriptions of clinical procedures, nor is the primary emphasis upon them. Instead, the author presents rounded picture of the child's normal psychological needs and of the familial and social influences which thwart these needs and lead to psychological maladjustment. The author is leader in the development of group psychotherapeutic techniques, and the book is based on extensive experience with group therapy of children.

SPOCK, BENJAMIN
The common sense book of baby and child care, with illustrations by Dorothea Fox. New York Duell Sloan and Pearce, 1946 527 p illus 20 cm. $5 00 5028

Contents (abridged) Preparing for the baby The right start. Breast feeding. Bottle feeding. Adding vitamins and water. Daily care. How the baby is doing. Your baby's development. Changes in diet and schedule. Weaning from bottle to cup. Inoculations. Toilet training. The one-year-old. Elements in the diet. Foods and meals. Managing young children. The two-year-old. Three to six. From six to eleven. Schools. Puberty development. Problems of feeding and development. Illness. First aid. Special problems. Index.

Note. One of the most successful books ever published for the guidance of parents of infants and young children. It is especially outstanding for its correlation of practical directions with sound child (and parent) psychology and for the wide range of detailed information.

STERN, CATHERINE, AND TONI S GOULD
The early years of childhood education by insight. New York Harper & Brothers, 1955 203 p 21 cm. $3 50 5029

Contents Part I, Education through insight. General principles and procedures. The parent's role. Stages and standards. Preparation and prevention. Freedom of choice. Security through success. Part II, Education through insight: Application in special problems. The poor sleeper The poor eater The timid child. The tyrant. The slow learner Conclusion Parents of pioneers. Bibliography Index.

Note. The educational method which is the subject of this book has been explained by the authors as follows: "Education through insight is new approach which appeals to the child's power of reasoning and comprehension without directly 'reasoning' with him. The adult alters a child's iewpoint by changing some aspect of the situation so that it is conducive to evoking a child' insight as to his fitting behavior The book is based on an extensive experience with kindergarten age and younger children. It is addressed to both parents and teachers who are concerned with the training of young children.

STOLZ, LOIS MEEK
Father relations of war born children, the effect of postwar adjustment of fathers on the behavior and personality of first children born while the fathers were at war Stanford Stanford University Press, 1954 365 p. illus. 23 cm. $4 00 5030

Contents General description of the father relations research project. I, The father-interview study: Description of the father-interview study Stress areas for fathers returning from war. Fathers' attitudes toward first-born children. Father's perception of self and first-born child, by E. Chance. II, The mother-interview study: Description of the mother-interview study by E. M. Dowley and W. L. Faust. Characteristics of war-born children as revealed by mothers, by E. M. Dowley and W L. Faust. Comparison of mother and father attitudes toward war-separated children, by A. Engvall. III, Observation of children in group situations. Beha ior of war-separated children in group situations, by N Q. Stevenson and others. IV Children in projective-play situations. Children as revealed in projective-play situations, by M. S. Faust. Aggression with balloons, blocking, and doll play by J. M. Ryder Father-child relations in story completions, by M. S. F ust. Father-child relations as revealed by dramatic-play completions, by L. C. Johnson and others. Summary and interpretation of study Ned Ford and his family General summary and interpretation. Appendixes. References.

Note. The results of research study extending over period of four years and conducted within the Department of Psychology of Stanford University under grant from the National Institute of Mental Health are published in this volume. Although the situation studied was of special nature the results throw light on the general problem of the role of fathers in the psychological development of children. The book is f interest to specialists in child psychology

STRANG RUTH
An introduction to child study Third edition New York The Macmillan Company 1951 705 p. illus 22 cm $5 75 5031

Contents (abridged) Part one, The roots of behavior The baby at birth. Hereditary influences. Part two, Early preschool period—the first two years How the baby learns. Child study and parent guidance. Part three, The preschool period—years three, four and five How preschool children learn. Special problems of the later

ent. Intellectual development. Personal work in the high school. The high school curriculum. Conclusion. The end of adolescence. Appendices. Index.

Note: In this standard work, the major physiological, social, moral, emotional, and intellectual factors in the development and behavior of young people from ages 13 years to 21 years are discussed. The viewpoint is practical, the language simple and direct, and the text is well illustrated with pertinent case histories, anecdotes, and life problems, charts, and other related material. The book is directed primarily to prospective and professional teachers. The first edition was published in 1936 and the third edition in 1948. In this fourth edition, there is a newly added chapter on personality and many revisions designed to incorporate the results of studies published since 1947 were made. A selection of new professional literature has been added to the reading lists, and the list of fiction and biography dealing with adolescents contained in an appendix has been revised to include some modern works. The book's organization and scope remain essentially the same.

CROW, LESTER D., AND ALICE CROW

Adolescent development and adjustment. New York, McGraw-Hill Book Company, Inc., 1956. 555 p. illus. 23 cm. $6.00 5044

Contents: Part I, Adolescent experiences: Significance of adolescence. Biological and cultural heritage. Approaches to the study of adolescence. Part II, Adolescent development: Physical and physiological growth. Maturing mental abilities. Changing emotional patterns. Personal and social aspects of personality development. Part III, Adolescent behavior motivations: Importance of interests and attitudes. Sex behavior of adolescents. Physical, mental, and emotional disorders. Conflicts in behavior disorders. Behavior [illegible]. [illegible] values. Part IV, Adolescent adjustment: Home adjustment of adolescents. School adjustment of adolescents. Vocational adjustment of adolescents. Social adjustment of adolescents. Appendices. Index.

Note: The first edition of a relatively new textbook and survey of the psychology of adolescence. Its primary use is as a textbook in teachers' colleges and liberal arts colleges. A survey of basic knowledge on physical and physiological growth is included. However, most of the space is devoted to personality development, behavior and problems of adjustment of adolescents. Discussions of numerous illustrated examples add interest to the presentation. The chapters include selected references to other literature, and there are occasional references in the text to research studies. The authors did not attempt to include references to the large body of literature.

CRUZE, WENDELL W.

Adolescent psychology and development. New York, The Ronald Press Company, 1953. 557 p. illus. 21 cm. $5.00. 5045

Contents: The period of adolescence. Problems and techniques. Physical changes at puberty. Physical development and physiological hygiene during adolescence. Intellectual development. Growth of interests in adolescence. Emotional development. Social development. Moral and religious development. The adolescent and his home. The adolescent and his school. Vocational selection and adjustment. The adolescent and his community. Crime and delinquency. Personality development and measurement. Mental hygiene in adolescence. Adjustments of atypical adolescents. The achievement of maturity. Index of names. Index of subjects.

Note: This book [illegible] study of the adolescent in modern society, his mental and physical growth, and his psychological development. It is especially intended as a textbook for college courses covering the psychology of the secondary school pupil. The content of the various chapters is largely based upon scientific research studies, the bibliographical citations to which are given in footnotes. There are [illegible] figures and 43 tables in the text, presenting some of the data taken from these studies.

FAEGRE, MARION L.

The adolescent in your family. Revised 1955. Washington, D. C., Government Printing Office, 1955. 110 p. illus. 23 cm. (United States Children's Bureau. Publication 347) $0.25 5046

Contents: Introduction. What is adolescence? Influences of earlier experience. Getting used to physical changes. Breaking away from childhood. Development brings new responsibilities. Friends and companions. What roles are boys and girls expected to play? Becoming adjusted to the opposite sex. Emotions in adolescence. Health needs of adolescents. Parents' part in educational and vocational planning. The future lies with youth. Index.

Note: This is the fifth in the Children's Bureau set of publications for parents, the others being *Prenatal care*, *Infant care*, *Your child from one to six*, and *Your child from 6 to 12*. It is published for the guidance of parents of children 12 and over. The chief of the Children's Bureau has written in the foreword: "Adolescence is a hard period to write about. Divergences between children seem to grow more marked as their range and variety of behavior becomes greater. . . . In the United States of today, to picture the wide variations in family life, in parents' hopes and expectations of their children, is impossible. . . . What the Children's Bureau has tried to do in this bulletin is to give some of the underlying needs of young, growing, human creatures which result in behavior that is sometimes hard for parents to understand. Our hope is that each parent who reads it will interpret what is said according to his own special situation and requirements."

FRANK, LAWRENCE K., AND OTHERS

Personality development in adolescent girls. By Lawrence K. Frank, Ross Harrison, Elisabeth Hellersberg, Karen Machover and Meta Steiner. Lafayette, Ind., Child Development Publications of the Society for Research in Child Development, Inc., Purdue University, 1953. 316 p. illus. 23 cm. (Monographs of the Society for Research in Child Development, Inc. Vol. 16, serial no. 53, 1951) $4.50. 5047

Contents: The purposes and aims of the study. The subjects. Methods and assumptions. Some general aspects of adolescent personality. The Rorschach test. The thematic apperception test. Drawings of the human figure. The Horn-Hellersberg test. Graphological study. Interpretive summary of findings. Suggestions for schools and youth agencies. Appendix: Sample form of questions to human figure drawings. Individual records: Prepubertal: Constance, Margaret, Nina. Pubertal: Barbara, Harriet, Jean. Adolescent: Jane, Ruth, Thelma.

Note: The study reported in this publication was undertaken for two major purposes: (1) to explore the personality and emotional reactions of 300 girls just before puberty, at puberty, and in later adolescence, as evidenced by their responses to projective techniques, such as the Rorschach test, the thematic apperception test, and the Horn-Hellersberg test; and (2) to experiment on the same 300 subjects with these same projective methods to discover what each technique could contribute (a) uniquely and (b) as corroboration of other methods to the understanding of personality. The report focuses "upon the psychological maturation of the adolescent girl, her image of herself and of her body, her acceptance or rejection of being female and of the feminine role, her relations with and feelings toward her parents and toward boys, her anxieties and feelings of guilt, her hopes and fears, and how she is facing the inescapable life tasks of adolescence. . . ." About one-third of the space is taken by the appendix of individual records of nine of the 300 subjects.

FRANK, MARY, AND LAWRENCE K. FRANK

Your adolescent at home and in school. New York, The Viking Press, 1956. 336 p. 22 cm. $3.95 5048

Contents: Speaking for parents. Physical growth and development in adolescence. Steps and stages—the pre-adolescent years—adolescence. Life tasks of our adolescent boys and girls. The family circle. Living with the adolescent. Family crises. What kind of education do adolescents need? The emerging high-school programs. Helping the adolescent in high school. Social life in high school. Appendix: Selected bibliography and college information. Index.

Note: A well-written popular book, addressed primarily to parents but of interest also to high school teachers and members of other professions who are professionally concerned with young people. It presents a sane, modern view of adolescent motivations and behavior. Co-ordinated with this presentation is advice on parental guidance of adolescent boys and girls and discussion of their educational requirements. The bibliography lists both popular and technical literature.

Note. A textbook designed for first courses in child psychology offered to undergraduate college students. Its content has been selected so that it is suitable for students majoring in home economics and in education as well as in psychology It provides broad view of the field and makes reference to the major research studies. The first edition was published in 1946. For the second edition, the book was reorganized in part and extended by the inclusion of new topics and later information on topics included in the first edition.

UNITED STATES CHILDREN'S BUREAU

Your child from one to six. Washington, D C Government Printing Office, 1956 110 p illus. 23 cm. (United States Children's Bureau. Publication 30, revised 1956) $0.20 5038

Contents. How children grow—physically emotionally and socially Play Guiding children's imagination. Curiosity and questioning. Constructive discipline. Children's food needs. Sleep. Bowel and bladder control. Things that bother parents. Learning to do without mother Safety precautions. Keeping children well. Prevention of disease. The sick child. Children's diseases and disorders. Emergencies. Index.

Note Another new edition, the first since 1945 of title which has been perennial "best seller" among U S. Government Printing Office titles. The booklet contains common-sense information for parents on the care of children between the ages of one and six. The new edition, somewhat more compact than its predecessor was again prepared under the direction of Mrs. Marion L. Faegre, in consultation with a wide range of professional workers—child psychologists, pediatricians, nurses, educators—as well as with specialists of the Pediatric Advisory Board of the Children's Bureau. With the exception of the useful appendix on children's diseases and disorders, wherein the symptoms and care are indicated for all the common childhood ills, the 1956 edition is entirely rewritten and especially reflects the gains made since 1945 in understanding of the child's emotional and psychological growth and needs. The publication has a full index.

WITMER, HELEN LELAND, editor

Pediatrics and the emotional needs of the child as discussed by pediatricians and psychiatrists at Hershey, Pennsylvania, March 6–8, 1947 Cambridge Mass. Harvard University Press, 1948 180 p. illus 23 cm. $2 00 5039

Contents Session I, What have we learned about emotional growth and development? Session II, What can the pediatrician in practice do in the field of mental health? Session III, What are pediatric departments now thinking and doing about problems of mental health? Session IV What are the next steps in pediatric teaching and training toward better understanding of the emotional life of the child? Session V What are the next steps in furthering comprehensive pediatric service? Session VI, Summary of the discussion. Appendix Ten hospital reports.

Note The proceedings of meeting of pediatricians, psychiatrists, and social workers called to discuss the psychological problems encountered in pediatric practice, and ways of integrating the practice of this branch of medicine with the relevant findings of psychiatry The arrangement of the volume follows the sequence of the agenda. The original papers read at the session are printed without abridgment the ensuing discussions are often abridged or summarized. The appendix contains reports from 10 hospitals on their arrangements for aiding the pediatrician who has to deal with emotional difficulties of the growing child.

YALE UNIVERSITY CLINIC OF CHILD DEVELOPMENT

The first five years of life a guide to the study of the preschool child Part one by Arnold Gesell. Part two by Henry M Halvorsen and others. Part three, by Arnold Gesell and Catherine S Amatruda. New York Harper & Brothers 1940 393 p illus 24 cm. $4 50 5040

Contents. Part I, Early mental growth, Introduction Understanding the preschool child. The nature of mental growth. The first year of life. From one to five. A pictorial survey of preschool behavior Part II Gradations of mental growth. Motor development. Adaptive behavior Language development. Personal-social behavior Part III, The study of the individual child The philosophy of the developmental examination. The conduct of the developmental examination. Clinical adaptations to atypical conditions. Individuality and its characterization. Developmental supervision and the school beginner Examination records and arrangements. Selected references. Index.

Note A volume, intended for laymen, students, and psychologists, which emphasizes the organic continuity of development of the child. Intelligence is treated as an aspect of an intricate reaction system. A great many clinical data are cited, and behavior pattern descriptions are given.

ADOLESCENCE

AUSUBEL, DAVID P

Theory and problems of adolescent development. New York Grune & Stratton 1954 580 p 22 cm. $8 50 5041

Contents Part I, Introduction Adolescence—a stage in personality development. Problems of adolescent development. Part II, Psychobiological problems Problems of psychological transition. Physiological aspects of pubescence. Physical growth and motor development. Psychological accompaniments of bodily change. Personality maturation during adolescence. Parent-child relationships in adolescence. Moral and religious development. Intellectual growth and interest patterns. Part III, Psychosocial problems. Adolescents and the wider community The adolescent peer culture. Sexual behavior in adolescence. Problems of vocational choice in adolescence. Adolescents and the school. Part IV Maladjustment and mental hygiene. Mental hygiene and guidance. Author index. Subject index.

Note A vast body of accumulated knowledge on adolescence is presented in this book, which is designed primarily for use as text by advanced students in psychology The information is organized within a theoretical frame of reference which holds "that adolescence is distinctive stage in personality development precipitated by significant changes in the biosocial status of the child." Although psychological aspects are emphasized, the physiological and physical aspects are not slighted. Much information from anthropology is included. Extensive reference lists are included in the chapters.

BLOS, PETER A

The adolescent personality a study of individual behavior New York D Appleton Century Company Inc., 1941 517 p. 22 cm. (Progressive Education Association publications. Study of Adolescents) $3 75 5042

Note. The special significance and usefulness of this book rest in its use of four detailed and complete case histories of children of different socio-economic and educational levels as mediums for a study of normal adolescent behavior On the basis of the first two cases and many illustrations from other cases, all of them collected by the Study of Adolescents, the author develops theory of adolescent personality which he then tests on the remaining two cases. Finally he applies the knowledge of adolescence thus gained to educational problems. The book is valuable for college, university and normal school courses in adolescent psychology mental hygiene, guidance, and child development.

COLE, LUELLA

Psychology of adolescence Fourth edition New York Rinehart and Company Inc., 1957 712 p illus. 23 cm. $6 50. 5043

Contents Introduction Adolescence as period of human growth. Part I, Physical development Growth in tissue, muscle, and bone. Physiological growth. Health and hygiene Part II, Emotional development. Emotional growth. Personality—measurement and types. Emotional deviates. Emotions and the school. Part III, Social development. Social growth. The adolescent and his home. Delinquency The social life of the school. Part IV Moral development Growth in attitudes. Community influence. Part V Intellectual development Mental growth. Intellectual-cultural inter

New York. Harper & Brothers, 1952 675 p. illus. 24 cm. $5.50. 5054

Contents (abridged). Part I, Physical, intellectual, and cultural backgrounds of adolescent behavior: Physical development and health in adolescence. Adolescent growth in mental abilities. The American culture and adolescent personality. Changing behavior in adolescence as revealed in interest patterns. Part II, Areas of adolescent adjustment: Maturation, adjustment, and emotion in adolescence. Social development and adjustment. Adolescent ideology—attitudes, character and morals, life philosophy. Educational development of adolescents and adjustment to school. The development of vocational plans and work experience. Home relationships of adolescents and achievement of independence. Part III, The individual adolescent. Name index. Subject index.

Note: Essentially a textbook for college undergraduate courses in adolescent psychology this monograph is useful also for reference. The thorough reader will emerge with the core of knowledge necessary for a practical understanding of the field and will know how to apply this knowledge to practical situations. Beyond this, the student is provided with a handle for comprehending and evaluating research literature. The author believes that adolescence and its problems should be considered in the perspective of the developmental trends of childhood and of adult life, not as an independent, entirely dramatic entity. In its entirety the bibliography which closes each chapter lists over 800 books and journals, including publications of 1950. Charts and tables are used to present concrete data and to summarize information.

MEAD MARGARET

From the South Seas studies of adolescence and sex in primitive societies. New York. William Morrow & Company 1939 1,088 p. 21 cm. $5.00. 5055

Contents (abridged): Coming of age in Samoa. The education of the Samoan child. The Samoan household. The girl and her age group. Formal sex relations. The role of the dance. The attitude towards personality. The experience and individuality of the average girl. Maturity and old age. Our educational problems in the light of Samoan contrasts. Appendix. Index and glossary. Growing up in New Guinea: Scenes from Manus life. Early education. The family life. The child and the adult social life. The child and the supernatural. The development of personality. Manus attitudes toward sex. The adolescent girl. The adolescent boy. [illegible] our traditional personality. Education and personality. The child's dependence upon tradition. Appendices. Index and glossary. Sex and temperament in three primitive societies: The mountain-dwelling Arapesh. The river-dwelling Mundugumor. The lake-dwelling Tchambuli. The implications of these results. Index and glossary.

Note. This book combines three of the author's books in one volume and constitutes a series of studies of primitive peoples in the South Seas made consecutively from 1925 to 1933, approached from the view-point of special age groups. In *Coming of age in Samoa*, New York, 1928, the author specializes on the adolescent girl; in *Growing up in New Guinea*, New York, 1930, the pre-adolescent age group is studied, and in *Sex and temperament*, New York, 1935, special study is made of the pre-school age, as well as the final character forms shown by the mature men and women. All of the details of behavior are based upon the author's personal observations and impressions during these separate field trips, and in this sense the work is a pioneer study. A new preface written in 1939 presents a summary of the author's aim and method, with reference to the three studies contained in this volume.

MIDCENTURY WHITE HOUSE CONFERENCE ON CHILDREN AND YOUTH

Personality in the making. Edited by Helen Leland Witmer and Ruth Kotinsky New York. Harper & Brothers 1952 454 p. 25 cm. $5.00. 5056

Contents: Part I, The development of the healthy personality: The making of a healthy personality. The influence of congenital characteristics. The influence of physical limitations. The importance of parent-child relations. Income level and health of personality. The effects of prejudice and discrimination. Religion as an aid to healthy personality development. Part II, Implications for the conduct of social institutions: Some cultural considerations. The family. The church and the synagogue. The school. Leisure-time services. Vocational guidance and employment services. Health services. Social services. Services of law-enforcement agencies. Next steps in research. Members of the staff of the Midcentury White House Conference on Children and Youth. Index.

Note: The conference named in the title of this book was guided and composed of physicians, social workers, educators, psychologists, and members of other professions concerned with the education, guidance, and care of young people. This book is the official report of the conference held in December 1950. It is not written in the condensed technical style that is characteristic of many official reports but is intended for reading as well as for reference. It is both a description of the status quo and a statement of accepted concepts and principles, and is essential reading for anyone interested in this field, particularly as it has been developed and is developing in the United States of America.

SCHNEIDERS ALEXANDER ALOYSIUS

The psychology of adolescence a factual and interpretive study of the conduct and personality of youth. Milwaukee The Bruce Publishing Company 1951 550 p. 23 cm. $4.00 5057

Contents (abridged) Part I, Introduction. Basic concepts of adolescent psychology Part II, Physical development during adolescence. Part III, The nature and development of motivational factors. The determinants of human conduct. Pleasure, pain, reward, and punishment. Part IV The dynamics of adolescent conduct: Adolescent needs and desires. Psychosexual development during adolescence. Development of interests and attitudes. Development of values, ideals, and principles. Part V, The nature and development of temperament and character: Emotional development in adolescence. Moral and religious development during adolescence. Part VI, Social development in adolescence—growth in personality Part VII, Sensory and intellectual development during adolescence: Development of the psychophysical functions. The development of intelligence. Bibliography Glossary Index.

Note A broad and readable account of the psychological development of adolescents, addressed to parents, teachers, and college students. Throughout the book, emphasis is given to explanations of why young people behave as they do, rather than to descriptions of typical behavior patterns. The importance of social pressures in the development of personality is given considerable attention, and there are frequent mentions of fundamental studies and experiments in this sphere. Each chapter concludes with a selected list of readings. The latter are supplemented with an 11-page bibliography.

SYMONDS PERCIVAL MALLON

Adolescent fantasy an investigation of the picture-story method of personality study New York Columbia University Press 1949 397 p. illus. 24 cm. $6.00 5058

Contents. Introduction. A review of literature on the thematic apperception test. The pictures and the data of the study. Theme analysis. Inventory of themes in adolescent fantasy Norms on the picture-story test. Comparison of fantasy and character. Associations to the stories. Study of quantitative relationships. Final selection of pictures, with data on the fantasy value of the pictures. Significance of fantasy in personality. Implications of fantasy for counseling and psychotherapy. Characteristics of adolescent fantasy. Case of Jack. Case of Jimmy. Summary and conclusions. Appendixes: Sketches of the forty cases. Personality traits of the forty cases as inferred from the stories and as observed in real life. Theme headings. Frequency of themes by picture. Correlation tables. Bibliography on the thematic apperception test. Index.

Note: The findings of a systematic study of 40-normal students equally divided as to sex and selected from junior and senior public schools are presented in this book. The main technique in the study was the use of the thematic apperception test, and 42 original pictures designed especially for the elicitation of adolescent fantasy were used in the test. These pictures are reproduced at the end of the book. The stories as told by the subjects are analyzed in detail according to accepted psychoanalytic concepts and the author states, "The picture of the adolescent which this study presents agrees closely with psychoanalytically oriented analyses of the adolescent years." The thematic apperception test is shown to be a valuable research technique in the study of the personality of adolescence.

GARRISON, KARL C

Psychology of adolescence Fifth edition Englewood Cliffs, N J Prentice-Hall, Inc., 1956 529 p illus. 23 cm $6 00 5049

Contents Part I, Introduction The adolescent age. Part II, Growth and development in adolescence: Physiological growth and development. Physical and motor development. Intellectual development. Emotional and social growth. Part III, Personality and adjustment in adolescence Changes of interests with age. Growth in attitudes and beliefs. Ideals, morals, and religion. The adolescent personality Personal and social adjustments. The hygiene of adolescence. Part IV Social forces affecting the adolescent The adolescent at home. The adolescent and his peers. The adolescent in the community The adolescent at school. Educational and vocational guidance. Juvenile delinquency Part V The end of adolescence From adolescence to maturity Appendix. Index of authors. Index of subjects.

Note A standard textbook of which five editions have been published since 1934. It is addressed to graduate college students and deals with problems of special significance to young people who are in the latter stages of adolescence. Problems of personality and adjustment are emphasized. The book also introduces the student to basic experimental study thus laying the foundation for a critical appreciation of the current literature in the field. References are made to many research studies. For the fifth edition, the author made revisions in the text of most chapters, in order to incorporate the results of studies published since the fourth edition was written, and added recent literature to the bibliographies. The annotated bibliography of popular literature touching upon adolescence, presented in an appendix, also was revised.

HAVIGHUST, ROBERT JAMES, AND HILDA TABA

Adolescent character and personality By Robert J Havighurst and Hilda Taba, of The Committee on Human Development, of the University of Chicago In collaboration with Andrew W Brown and others New York John Wiley & Sons Inc. 1949 315 p illus 22 cm $5 25 5050

Content Part 1 Overview of the studies, by R. J Havighurst and H. Taba The problem of studying character The community setting. Subjects and procedures. Part 2 Group studies Community factors in relation to character formation, by R. J Havighurst and D Neubauer Social class and school adjustment in relation to character reputation, by N L. Weckler The relation of the church to character formation, by D Neubauer The role of adults outside the family in character formation, by R. J Havighurst and A. F Rieger Moral beliefs and the ability to apply them in solving problems of conduct, by H. Taba. The relation of values to character by M. Dorr and R. J Havighurst. Personal-social adjustment and character reputation, by F A. Kingsbury Part 3 Character and personality types, by M Dorr and others Studies of individuals. The self-directive person. The adaptive person. The submissive person. The defiant person. The unadjusted person. Part 4 Suggestions for character education Conclusions and implications, by R. J Havighurst and others. Part 5 Methods of studying character and personality Methods of studying character reputation by F A. Kingsbury and N L. Weckler Methods of determining social status, by W L. Warner and others. Methods of studying affectional family relationships, by A. W Brown and others. Methods of studying the role of adults outside the family by R. J Havighurst. Methods of studying moral beliefs, by H. Taba. Methods of studying values, by M Dorr and R. J Havighurst. Methods of studying personal-social adjustment, by F A. Kingsbury Interviewing and miscellaneous methods, by D Neubauer and R. J Havighurst. Comparison of these studies with the Character Education Inquiry by N L. Weckler Index.

Note. A report of field work carried on in Prairie City small pseudonymous laboratory city typical of midwestern communities, by the Committee on Human Development and interdepartmental group representatives of the biological and social sciences at the University of Chicago. The book covers character development in youths of this city who are 16 years of age hen the study was begun. The final part of the volume records some of the tests and questionnaires that are used in the studies. The book is especially intended for social workers, teachers, and other persons who work ith youth.

HORROCKS, JOHN E

The psychology of adolescence. Boston Houghton Mifflin Company, Inc., 1951 614 p illus. 23 cm $5 75 5051

Contents Part one, The adolescent period The nature of adolescence. Part two, The adolescent and his relation to others: The adolescent and his family Social adjustment. Friendships and personal acceptability Adolescent groups and group membership. Heterosexual relations. Part three, Development and growth. Intellectual development. Physical growth. Physiological and anatomical development. Strength and motor abilities. Part four, Adolescent activities and interests Nature and importance of interests and activities. Interests and the media of communication. Vocational interests and aptitudes. Attitudes and ideals. Part five, An overview of behavior: The bases and outcomes of adolescent behavior. The case of Mary Marlowe—an example of adolescent behavior Index of authors. Index of subjects.

Note. A comprehensive overview of the psychology of adolescence, strongest perhaps in its discussion of development and growth, and less strong in its discussion of vocational interests and aptitudes. It is well written, readable, well documented and the selection of source materials has been critically done.

HURLOCK, ELIZABETH B

Adolescent development. Second edition. New York McGraw Hill Book Company Inc., 1955 590 p illus. 24 cm. (McGraw Hill series in psychology, Clifford T Morgan, consulting editor) $6 50 5052

Contents. Adolescence—age of transition. Puberty changes. Psychological significance of body changes. Emotions in adolescence. Social behavior Social adjustments. Adolescent interests. Personal interests. Adolescent recreations. Religious beliefs and attitudes. Moral concepts and behavior Sex interests. Dating and courtship. Family relationships. Personality Bibliography Visual bibliography Name index. Subject index.

Note. A well-written summary of accumulated knowledge concerning the behavior interests and attitudes of boys and girls between the ages of 10 and 21 years. It is used as a textbook in the field of adolescent psychology and also as a source of information for interested parents, teachers, social workers and physicians. The field is covered in considerable detail, and the information has been drawn from wide range of literature, including both popular and professional publications. The first edition was published in 1949 The chapter on family relationships in this second edition is new and all of the other chapters have been revised, some of them ery extens ely in order to give more emphasis to the findings of recent research. References to important older studies have been retained in the bibliography although less space is given to them in the text itself Retention of older references plus addition of references to the new literature—some of it published as recently as 1954—has extended the bibliography from 23 pages to 42.

JONES, HAROLD ELLIS

Development in adolescence. Approaches to the study of the individual New York D Appleton-Century Company Inc. 1943 166 p illus. 21 cm (The Century psychology series R M Elliott, editor) $2 75 5053

Contents Here John was at home Into adolescence. John as seen by his teachers and classmates. John as a member of social groups. Physical development. Motor and mental abilities. Interests and attitudes. An interpretive study of some "underlying tendencies. John as he saw himself. The struggle for maturity Index.

Note An extended case history of adolescence based on records obtained for single individual over period of seven years. The person called John was selected from grade-group of urban public school children. The growth study, continuing to the end of senior high school, includes physical and physiological measurements and records of various aspects of behavioral development during adolescence, with emphasis on this particular individual's handicaps and adjustments. The research on which the book is based was done at the Institute of Child Welfare at the University of California.

KUHLEN, RAYMOND G

The psychology of adolescent development (under the editorship of Gardner Murphy)

CRAWFORD ALBERT BEECHER AND PAUL S BURNHAM

Forecasting college achievement a survey of aptitude tests for higher education. Part 1, General considerations in the measurement of academic promise. New Haven Yale University Press, 1946. 291 p. illus. 24 cm. $5.00. 5065

Contents: Background of educational measurements. The measurement of educational performance and basic statistical principles. Differential aptitude and general intelligence tests. Achievement testing. A sample aptitude battery. Century tests and primary abilities. Test construction and the measurement of "idiosyncrasies." Appendices: Practice booklet (Yale battery). Tables supplementary to the text of Chapters and ix. References and author index. General index.

Note: A detailed study on the professional level of the nature and usability of various types of aptitude tests designed to forecast "individual relative promise for differential types of study and of agreement with them." Some comparison with the volume essay type of examination is included. The work is related but bears little resemblance to manual of educational aptitude tests prepared by the same author for the American Council on Education and issued in preliminary form in 1942. The present volume deals with general types and specifically with guidance tests used in high schools and through the first college year. Also, it discusses selected aspects of College Entrance Examination Board tests. Both authors are associated with the Student Appointment Bureau of Yale University.

CRONBACH LEE JOSEPH

Essentials of psychological testing. Under the editorship of Gardner Murphy New York, Harper & Brothers, 1949 475 p. illus. 24 cm. $5.00. 5066

Contents: Part 1, Basic concepts. Who uses tests? Purposes and types of tests. Interpreting test scores. How to choose tests. How to give tests. Part 2, Tests of ability The Binet scale and its descendants. Mental diagnosis, the Wechsler test. Other tests of general ability Factor analysis: the pattern of abilities. Tests of special abilities. Problems in prediction, prognostic tests. Measures of achievement. Part 3, Testing of typical performance: Problems and practices. Self-report techniques—personality Self-report techniques—interests. The use of test results in counseling. Self-report techniques—attitudes. Observation of behavior in normal situations. Observation in test situations. Projective techniques. Appendixes: Reviews of studies of testing. Principal test publishers and distributors. Author index. Subject index.

Note: A textbook for college students. The author recognizes that the multiplication of available tests makes it impossible for the student to study them all and consequently concentrates on the basic principles of testing in order that the student may learn to choose tests wisely for particular needs and to be aware of the weaknesses of whatever tests he uses. At the same time, he introduces the tests most widely used and most widely cited in the literature of the subject and, by critical analysis of such tests, provides examples of the application of the underlying principles. A selective summary listing of tests is included in many of the chapters, with accompanying critical remarks from qualified reviewers. Suggested readings and references appear at the conclusion of each chapter.

FERGUSON LEONARD W

Personality measurement. New York McGraw Hill Book Company Inc., 1952 457 p. illus. 24 cm. (McGraw Hill publications in psychology Clifford T Morgan, consulting editor) $6.50 5067

Contents (abridged): Fundamental concepts. Intuitive or empirical approach—a rational approach. Attitudes—an [illegible] approach. Personality unidimensional approaches—multidimensional approaches. Adjustment, diagnostic approaches—prognostic approaches. Interests, nomothetic approaches—analytical approaches. Projective techniques, perceptual approach—an empirical approach. Performance, observational approaches—experimental approaches. Evaluation and summary. References. Index.

Note: The chief virtue of this book is its detailed analysis of the preparation of objective (questionnaire) tests for personality traits. Its chief defect is the slight attention given to projective devices. It is designed for undergraduate majors or beginning graduate students in psychology but can be used with little effort by sociologists and others lacking technical psychological training.

GOODENOUGH FLORENCE LAURA

Mental testing its history principles, and applications. New York Rinehart & Company Inc., 1949 609 p. illus. 24 cm. $6.50 5068

Contents (abridged): Part 1, Historical orientation: The social need for mental diagnosis. The educational need. The early tests, 1887–1915. Later developments. Part 2, Principles and methods: The bearing of testing theory upon test interpretation. The analysis and selection of test items. Units of measurement. Age standards and quotients as interpretative measures. Means, medians, and percentiles. Other devices for interpreting test scores. Testing the tests. Analysis of variance. Some questions of mental organization. Part 3, Tests and scales: The conduct of an examination, with particular reference to the testing of young or difficult children. The measurement of special talents and deficiencies. The measurement of motor development and motor skill. The measurement of interests and attitudes. The measurement of personal-social characteristics. Projective methods for the study of personality. Tests for vocational guidance. Part 4, Applications: Testing in schools and colleges. Testing in clinical practice. The use of tests in industry. Testing the Armed Forces. The use of tests in the study of group differences. Glossary. Bibliography. Author index. Subject index.

Note: A general survey of the development and current status of mental testing and mental tests. Particular attention is paid to the history of testing, the currently understood basic principles of testing, and to the chief types of tests. The book is useful to persons who want an inclusive and fairly detailed view of the subject, especially educators and others who are concerned with the selection and administration of tests.

GREEN HARRY A., AND OTHERS

Measurement and evaluation in the elementary school. By Harry A. Green, Albert Jorgensen, and J Raymond Gerberich. Second edition. New York Longmans, Green and Company 1953 617 p. illus. 22 cm. $5.00 5069

Contents: Measurement, evaluation, and the classroom teacher. Development of educational and mental measurement. Education and mental measuring instruments and techniques. Essential qualities of good measuring instruments or techniques. Constructing and using standardized tests. Constructing and using oral and essay tests. Constructing and using informal objective tests. Constructing and using performance tests. Constructing and using evaluation tests and techniques. Using intelligence and aptitude tests. Using personality instruments and techniques. Summarizing the results of measurement. Interpreting the results of measurement. Determining relationships among the results of measurement. Measuring and evaluating in the receptive language arts. Measuring and evaluating in the expressive language arts. Measuring and evaluating in the social studies. Measuring and evaluating in elementary-school mathematics. Measuring and evaluating in the elementary-school sciences. Measuring and evaluating in the fine arts. Measuring and evaluating in health and physical education. Measuring and evaluating general educational achievement. Glossary. Appendix—publishers of tests illustrated and discussed. Index of names. Index of subjects.

Note: A handbook used both for instruction in organized classes in teachers colleges and schools of education, and for reference by practicing teachers. As indicated in its title, it is limited to tests and techniques applicable in the elementary school, but within this limitation it is comprehensive. It covers not only standardized tests but also evaluatory methods including examinations constructed by teachers. The principles of measurement and evaluation, methods of administering tests, interpretation of test results and the actual content of typical tests, are all covered. Literature references are included. The first edition was published in 1942. This second edition represents major revision with much new material. The same authors have produced complementary book for secondary schools, *Measurement and evaluation in the secondary school*, second edition, Longmans, Green and Company 1954 $5.00.

GREENE, EDWARD BARROWS

Measurements of human behavior Revised edition. New York The Odyssey Press, 1952 790 p. illus. 21 cm. $5.00. 5070

PSYCHOLOGICAL TESTING

ABRAMSON, HAROLD ALEXANDER, AND OTHERS

Non projective personality tests. New York The New York Academy of Sciences 1946 148 p illus 23 cm. (New York Academy of Sciences Annals Vol. 46, p 531–678, 1946) $1 75 5059

Contents Part I, Personality inventories: The effect of alcohol on the personality inventory by H. A. Abramson. Psychobiological screening procedures in the War Shipping Administration, by G. G. Killinger and J Zubin. Part II, The Cornell indices and the Cornell word form Construction and standardization, by B. Mittelmann and K. Brodman. *Results*, by A. Weider and D. Wechsler Application, by H. G. Wolff. The Cornell selectee index—an aid in psychiatric diagnosis, by H. J Harris. Part III, Ability patterns and personality The expression of personality and maladjustment in intelligence test results, by R. Schafer Personality and diagnostic evaluation by means of non-projective techniques, by E. Wladkowsky Difference between cases giving valid and invalid personality inventory responses, by Z. A. Piotrowski. Part IV Theory Principles underlying non-projective tests of personality by D. Rapaport. Problems of performance analysis in the study of personality by M. Scheerer

Note The papers comprising this volume were presented at conference held in March, 1945 Various types of nonprojective intelligence tests employed in personality determination are described and evaluated. The discussion includes tests devised for use in selecting military trainees for the United States Army and American Merchant Marine during World War II. There is no index.

AMES, LOUISE BATES, AND OTHERS

Rorschach responses in old age by Louise Bates Ames Janet Learned, Ruth W Métraux and Richard N Walker New York Paul B Hoeber Inc. Medical Book Department of Harper & Brothers 1954 229 p illus. 24 cm $6 75 5060

Content Introduction. Literature. Subjects, methodology and scoring. Classification I cases. Statistical analysis of Rorschach scores. Normal responses. Presenile responses. Senile responses. Other dimensions of classification. Old age and childhood. Area. Determinants. Content. Related concepts. Longitudinal Rorschachs. Summary Appendix Clinical summary tables for normal, presenile and senile responses. References. Index.

Note. This book is the report of a study made "to determine whether or not pattern age changes take place in the human organism in old age as they do in childhood. Two hundred men and women between the ages of 70 and 100 were tested with the Rorschach test, and their responses are analyzed in detail. The tests for some subjects were repeated after a two-year interval and the results of the second tests are presented also.

BAUMAN, MARY KINSEY, AND SAMUEL P HAYES

A manual for the psychological examination of the adult blind. A project of the National Psychological Research Council for the Blind New York The Psychological Corporation 1951 58 p. 23 cm. $1 25 5061

Contents Why special manual for testing the blind These things we all should know Special considerations in the client's history Tests and testing techniques. Reporting the psychological examination. Bibliography Appendix.

Note. The special problems encountered in administering psychological tests to the blind are considered in this booklet The chapter on tests and testing techniques contains descriptions and evaluations of selection of standard tests which have been used or may be used in testing the blind. The book is of interest to graduate psychologists who are concerned with testing of blind persons.

BECK, SAMUEL J

Rorschach's test. New York Grune & Stratton, 1945–52 3 v illus. 24 cm. Vol. I, $4 50, vol II, $5 50, vol. III, $6 00 5062

Contents Vol. I, Basic processes: Experimental procedure. The whole response W Detail and rare detail: D and Dd. Scoring problems. The white space: Ds and Dds. The organization activity: Z. Approach and sequence Ap, Seq. The movement response: M. The color response: C. The light-determined response: Y, V, T Diverse determinants. Important ratios. The form response, F+ and F— The popular response P Content. Scoring record and summary Bibliography Appendix 1. Table of organization (Z) values in the ten figures. Appendix 2 Synopsis of changes from Dd to D. Appendix 3 Graph of approach expectancy for R to 120. Appendix 4 Numeral designations of most frequently selected D and Dd. Index. Vol. II, A variety of personality pictures. Part I: Concerning personality Psychologic significance of the Rorschach test factors. Part II The intelligence curve. The adolescent years. Schizophrenic solutions. Neurotic struggles. Before and after—the test repeated in the same persons. Bibliography Index. Vol. III, Advances in interpretation Concerning the personality Advances in interpretation. An adolescent boy in psychotherapy Acute anxiety in successful man. An engineer and many women. A boy in the Orthogenic School. Synopsis and comment—critical and speculative. Bibliography Index.

Note. A collection of studies based largely on the author's own clinical experiences in using the Rorschach test and on his research. Much that is basic and useful is included on interpretation, and there is much verbatim citation of patients' responses. The first edition of Volume I was published in 1944 and the second edition in 1949 hence a current set consists of Volume I, second edition, 1949 Volume II, 1945 and Volume III, 1952. The author is Head of the Psychology Laboratory of the Department of Neuropsychiatry of the Michael Reese Hospital, Chicago.

BENNETT, GEORGE K , AND OTHERS

Differential aptitude tests manual. By George K Bennett, Harold G Seashore, and Alexander G Wesman Second edition. New York The Psychological Corporation, 1952 77 p illus. 28 cm. $2 00 5063

Contents An integrated battery of guidance tests. Administration and scoring. Norms and profiles. Validity Reliability *Principles of differential measurement*. Appendixes Correlations of the *DAT* with other tests. Development of form B of the *Mechanical Reasoning* test. Bibliography

Note. The *Differential aptitude tests* are a battery of tests developed to provide an integrated, scientific and well standardized procedure for measuring the ability of boys and girls in grades 8 through 12 for purposes of education and vocational guidance. In this manual the eight tests are described, and directions are given for their administration and scoring. A good share of the space is devoted to data on norms, validity reliability etc., of the tests. The manual is addressed primarily to school personnel who use the *Differential aptitude tests* in the testing of students. It is also of interest as an example of well organized test manual to advanced college students and graduates with professional interests in psychological testing. The first edition was published in 1947 The most important new matter in the new edition bears on the validity of the tests as established by research studies.

BUROS, OSCAR KRISEN, editor

The third mental measurements yearbook. New Brunswick Rutgers University Press, 1949 1,047 p. 27 cm $12 50 5064

Contents Tests and reviews. Achievement batteries. Character and personality English. Fine arts. Foreign languages. Intelligence. Mathematics. Miscellaneous. Reading. Science. Social studies. Vocations. Books and reviews. Periodical directory and index. Publishers directory and index. Index of titles. Index of names. Classified index of tests.

Note The sixth in a series of volumes, begun in 1935, designed to aid workers in the fields of education, personnel administration, and psychology in locating and evaluating tests and books on testing. The aim is to include all commercially available tests published in English between October 1940 and December 1947 Section 1 in the above-indicated fields, accompanied by rather than 663 tests in the above-indicated fields, accompanied by rather lengthy reviews and appraisals of the tests A similar arrangement is followed in the second section for 549 books on measurements and related topics. Each section includes extensive bibliographies relating to the test or book under discussion.

and the results are presented in Part two of the book. The essential [illegible] the projection of Rorschach blots on screen [illegible] while the persons being tested [illegible] recorded their responses in specially prepared booklets. [illegible] of this technique the blots are printed in the booklet [illegible] projector is unnecessary. The book is addressed to [illegible] psychologists, and familiarity with the basic Rorschach [illegible] assumed in the treatment. The first edition was published in 1944. Experience acquired since that time in group techniques has been incorporated in this extensively revised edition.

HATHAWAY STARKE ROSECRANS AND PAUL E. MEEHL

An atlas for the clinical use of the MMPI. Minneapolis The University of Minnesota Press, 1951 799 p. 27 cm. $9 75 5076

Contents (abridged) The making of the atlas. Arrangement and description of the data. The use of the atlas and its indexes. Bibliography. Case histories. Low-point index. Contributors' index. Diagnosis index. M? index. L index. F index. K index.

Note A reference book for clinical psychologists who use the Minnesota Multiphasic Personality Inventory. Most of the space is devoted to [illegible] case histories, which are [illegible] of actual records of persons, most of whom were patients of the Psychiatric Unit of the University of Minnesota Hospitals. The histories are coded according to the MMPI profiles. They were selected to provide [illegible] case [illegible] of clinical experience with the MMPI.

KABACK, GOLDIE RUTH

Vocational personalities an application of the Rorschach group method. New York Bureau of Publications, Teachers College, Columbia University 1946 116 p. illus. 23 cm. (Teachers College, Columbia University Contributions to education. No. 924) $2 10. 5077

Contents Introduction: methods frequently used to investigate [illegible]. The problem. Rorschach investigations and procedures used in this study. The subjects of this study. Analysis of the [illegible]. The relationships between Rorschach components. Summary and conclusions. Bibliography. Appendices.

Note Rorschach practitioners in the United States of America have widely urged the adoption of the Rorschach technique for vocational guidance and vocational selection, contending that [illegible] and personality can be determined from Rorschach records, and claiming that the Rorschach test can be of considerable help in selecting persons for positions requiring certain personality traits and in guiding students with respect to educational training and vocational preparation. The study reported in this book was undertaken to investigate the validity of these claims. [illegible] groups totaling 434 individuals were tested with the Rorschach group method, from which 300 records were used in this study: 75 pharmacists, 75 accountants, 75 pharmacy students, 75 accountancy students; 134 [illegible] records were not included. The [illegible] are recorded in detail for these groups, and conclusions are drawn from the results.

KELLY E. LOWELL, AND DONALD W FISKE

The prediction of performance in clinical psychology Ann Arbor *University of Michigan Press*, 1951 311 p. illus. 28 cm. $5.00. 5078

Contents An overview of the project. Sequential phases of the research. The subjects and their training. Predictors. Analyses of predictive measures. The criterion problem. Conventional criteria of professional success. The measurement of diagnostic competence. The measurement of therapeutic competence. The measurement of research competence. The evaluation of other professional qualifications. A prediction problem. Validity of university predictions. The validity of objective tests. The validities of assessment ratings. The prediction of specific criteria in [illegible]. Summary and discussion. List of appendices. Bibliography. Index of names. Index.

Note A book which had its origin in research carried out at the University of Michigan in the years 1946–51 for the Veterans' Administration. The purpose of the research was to develop [illegible] selection program for the selection of trainees in clinical psychology. Specifically [illegible] the project was concerned with the selection of graduate students for training in [illegible] four-year doctoral program in clinical psychology. The primary objective was the evaluation of selection procedures. The techniques of the study and the results are presented in detail. The book is of interest not only to persons who are concerned with the selection of students for training in clinical psychology but also to those who are concerned with the selection of professional personnel in general.

KLOPFER, BRUNO, AND OTHERS

Developments in the Rorschach technique. Volume I, Technique and theory By Bruno *Klopfer* Mary Ainsworth Walter G Klopfer, Robert R. Holt. Yonkers N Y World Book Company *1954 726 p. illus. 23 cm.* $7.50 5079

Contents (abridged) Part I, *Administration and scoring*. Part II, Interpretation Quantitative analysis. Sequence analysis. Evaluation of intellectual level, control, creative potential, and the intravert-extratensive relationship. Interpretative hypotheses derived from the analysis of content. Part III, Theory Problems of validation. Implications of some contemporary personality theories for Rorschach rationale. Rorschach hypotheses and ego psychology. Part IV Reporting of findings. Principles of report writing. Illustrative case study. Rorschach prognostic rating scale. Appendix: Freudian and Jungian approaches to the development of ego and self. Index of names. Index of subject matter.

—— *Volume II, Fields of application.* By Bruno Klopfer with contributions by Mary D Ainsworth and others. Yonkers, N Y World Book Company 1956 828 p. illus. 23 cm. $8.50 5080

Contents: Part I, Genetic psychology Problems in the use of the Rorschach technique with children, by B. Klopfer and others. The interpretation of children's records, by B. Klopfer and others. Rorschach [illegible] in child therapy—a case study by M. Spiegelman, and B. Klopfer. The psychological significance of age patterns in the Rorschach records of children, by L. Fox. The development of perception in the Rorschach, by G. Meili-Dworetzki. The use of the Rorschach technique in child guidance clinics, by D V Anderson and R. Higham. The application of the Rorschach technique to geriatrics, by W G. Klopfer. Part II, Medical psychology The clinical situation, by B. Klopfer Methodological research problems, by B. Klopfer and M Spiegelman. Differential diagnosis, by B. Klopfer and M. Spiegelman. Diagnosis of organic brain damage in the adult, by G. Baker Diagnostic case studies of male adults having organic brain damage, by G. Baker. Part III, Social psychology anthropology and industrial psychology: The Rorschach technique in social psychology by M. Spiegelman. The Rorschach technique in personality and culture studies, by A. I. Hallowell. The Rorschach technique in industrial psychology by G. Williams and [illegible]. Top management and the Rorschach technique, by R. F [illegible]. Part IV Diagnostic practice and projective theory Some relationships between the Rorschach technique and other psychodiagnostic tests, by E. [illegible]. A re-evaluation of projective theory by H. [illegible]. Bibliography by M. D. [illegible]. Cumulative indexes, Volumes I and II, by M. D Ainsworth.

Note These complementary volumes cover at [illegible] graduate-professional level the administration, scoring, interpretation, and fields of application of the Rorschach test. A full-length case study is included in the first volume, and [illegible] comprehensive bibliography in the second volume. The bibliography is in two parts, one covering the literature to 1955 and arranged alphabetically by authors' names, the other covering the literature published 1945–55 and arranged by topic. The work is more advanced, more detailed and more up-to-date than *The Rorschach technique*, by B. Klopfer and D. M. Kelly described below

KLOPFER, BRUNO AND DOUGLAS MCGLASHAN KELLEY

The Rorschach technique a manual for a projective method of personality diagnosis. By Bruno Klopfer clinical contributions by *Douglas McGlashan Kelley* With 1946 supplement by Bruno Klopfer and Helen H. Davidson. Yonkers, N Y World Book Company 1946 475 p *20 cm. illus.* $5.00 5081

Contents Part one, Achievement and aptitude: Introduction. Types of appraisals. Characteristics of good instrument. Construction of test items. Tests of early childhood. Individual tests of ability Measures of educational achievement. Group tests of ability Mechanical and motor tests. Tests of special aptitudes. Military development of tests and ratings. Part two, Elementary statistics: The interpretation of scores. Measures of relationship Factorial analyses. Part three, Dynamic patterns: Personality—dynamic theory and structure. Types of estimates. Drawing, painting, and handwriting. Stories and fantasies. Play and drama. Interests. Appraisals of attitudes. Personality inventories. Rorschach techniques. Observations of behavior Appendixes Publishers of tests and inventories. Classified list of tests and inventories. Index of authors. Subject index.

Note An established textbook and reference manual. It provides at the same time comprehensive view of behavioral measurement techniques and descriptive analyses of wide variety of tests. The classified list of tests and inventories included as an appendix runs to 27 pages. The first edition was published in 1941. In the present edition, the work has been rearranged, partially rewritten, and widely revised so as to include material that has become available since 1941 Two completely new chapters deal with military contributions (the results of World War II experience) and personality theories. The useful lists in the appendixes also are new additions. The extensive bibliography which serves also as the author index, has been revised.

GUILFORD, J P

Psychometric methods. Second edition. New York McGraw Hill Book Company, Inc. 1954 597 p illus 23 cm (McGraw Hill publications in psychology Clifford T Morgan, consulting editor) $8 50 5071

Contents Psychological measurement. Psychological theory A mathematical introduction. The method of average error Method of minimal changes. The constant methods. The method of pair comparisons. The method of rank order. Scaling from interval and ratio judgments. The method of successive categories and other scaling methods and problems. Rating scales. Principles of judgment. Theory of psychological tests. Reliability and validity of measures. Test development. Factor analysis. Appendix.

Note A comprehensive view of psychological measurement with emphasis on the fundamental unity of all measurement techniques is presented in this book. The first edition was published in 1936. The book was reorganized and considerable amount of new matter was added in this second edition.

GULLIKSEN, HAROLD

Theory of mental tests. New York John Wiley & Sons, Inc. 1950 486 p. illus 23 cm (Wiley publications in psychology Herbert S Langfeld, advisory editor) $7 50 5072

Contents (abridged) Basic equations derived from definition of random error Fundamental equations derived from a definition of true score. Errors of measurement, substitution, and prediction. Effect of test length on mean and variance. Effect of test length on reliability Effect of test length on validity Effect of group heterogeneity on test reliability Correction for univariate selection in the three-variable case Correction for multivariate selection in the general case A statistical criterion for parallel tests. Experimental methods of obtaining test reliability Reliability estimated from item homogeneity Speed versus power tests. Methods of scoring tests. Problems of eighting and differential prediction. Item analysis. Bibliography Appendixes Author index. Topic index.

Note The subject of this book is the mathematical theory and statistical methods used in interpreting psychological results. It is well-organized, advanced textbook which can also serve as reference book. The author who is Research Adviser for the Educational Testing Service at Princeton and Professor of Psychology at Princeton University points out that, although the book is primarily for those working in test development, the techniques are applicable in fields other than test construction, such as measurement of attitudes or opinions, appraisal of personality and clinical diagnosis. Illustrative computing diagrams are given for those formulas simple enough to be changed into linear form. The book brings together the technical developments in test theory of the first half of the 20th century and in its introduction goes back to the beginnings in the 1890's. There is a comprehensive bibliography

HALPERN, FLORENCE

A clinical approach to children's Rorschachs New York Grune & Stratton, 1953 270 p 24 cm $7 00 5073

Contents Theoretical concepts. Test administration. Scoring. The significance of the test factors. The nature of the stimulus. General interpretive problems. The well adjusted child. The emotionally disturbed child. Schizophrenia. Organic disorders of the central nervous system. Mental retardation. The Rorschach test and psychotherapy Selected bibliography Index.

Note A useful book based on an extensive experience in testing children with the Rorschach test. It is concerned only with the use of this test on children two and one-half years to 10 years of age. The chapter on test administration contains helpful suggestions, particularly on the testing of very young children. Most of the space is appropriately devoted to interpretation of test scores. The discussions of interpretative techniques and special problems are supplemented by 40 actual case records. The book is directed to graduate students and practicing clinical psychologists.

HARRIS, ROBERT E , AND OTHERS

Recent advances in diagnostic psychological testing, a critical summary Springfield, Ill Charles C Thomas, 1950 120 p. 22 cm. (American lecture series. Publication number 81 A monograph in American lectures in psychology, edited by Molly R. Harrower) $2 75 5074

Contents. Contemporary trends in psychodiagnosis, by J. G. Miller Psychodiagnostic testing in psychiatry and psychosomatic medicine, by R. E. Harris. Neuropsychology by H. L. Teuber: Occipital lobes. The temporal lobes. The parietal lobes. The frontal lobes. Interpretations. References. The application of diagnostic psychological methods to counseling and psychotherapy by G. A. Muench Treatability of patients. Success of therapy Process of therapy Comparative evaluation of therapeutic techniques. Tests as therapeutic agents. Development of new types of diagnostic devices. The personality of the therapist. References. Recent developments in diagnostic testing of children, by L. J. Stone. Basic concepts of development and personality Diagnostic advances in nonprojective testing methods. Diagnostic advances in projective techniques. Conclusions. References. Test construction and methodology by J. Zubin.

Note This publication contains concise reviews of the recent applications of diagnostic psychological methods in the fields of counseling, psychotherapy psychiatry psychosomatic medicine, clinical neurology and child development. Advances in mental test construction and interpretation are described and discussed, and the direction of future research is considered. The papers were originally read at the Symposium on Recent Advances in Diagnostic Techniques at the 1948 Boston meeting of the American Psychological Association.

HARROWER, MOLLY RACHEL, AND M E. STEINER

Large scale Rorschach techniques. Second edition A manual for the group Rorschach and multiple choice tests With contributions by Floyd O Due, Beatrice A. Wright, and M Erik Wright. Springfield Ill Charles C Thomas, 1951 353 p illus. 24 cm. (American lecture series. Publication number 82 A monograph in American lectures in psychology edited by M. R. Harrower) $9.00 5075

Contents (abridged) The group Rorschach—development, administration, scoring. Analysis of group Rorschach material in terms of location, determinants, and content. A multiple choice test for screening purposes. Recent developments in group techniques for the Rorschach test. An analysis of content. A statistical study of card-pull. Index.

Note. A pioneer work in the administration of the Rorschach ink-blot test to groups of persons rather than to individuals. It was based originally upon an experimental investigation of the group technique, in which 340 persons took part and gave total of 8,526 responses. These responses were analyzed from various standpoints,

Contents: Volume i. Part i, Introduction. Part ii, Diagnostic intelligence testing: The nature of intelligence. The Bellevue scale. The Babcock test. Part iii, Diagnostic testing of concept formation: Introduction to the testing of concept formation. Verbal concept formation. The sorting test. The Hanfmann-Kasanin test. Patterns of achievement on the three concept formation tests. Bibliography. Appendices: Vital data of our clinical and control population. Tables—Group averages and individual scores. Review of literature, by Martin Mayman. Indexes. Volume ii. Part iv, Diagnostic testing of personality and ideational content: Introduction. The word association test. The Rorschach test. The thematic apperception test. Diagnosing with a battery of tests. Appendices: Tabulations on the Rorschach scores of each subject of our research population. Extracts of deviant verbalizations on the Rorschach test. Review of the literature on the tests treated in this volume. Indexes.

Note: A detailed study, based on the clinical investigations of the authors, of the techniques and results of using in psychiatric diagnosis a battery of seven tests: The Wechsler-Bellevue intelligence scale, the Babcock test, the Sorting test, the Hanfmann-Kasanin test, the Word association test, the Rorschach test, and the Thematic apperception test. Each test is described, the psychological rationale of the function underlying achievement on the test is explained, administration of the test in the clinic is discussed, then the results are presented chiefly in the form of statistical data. The work is also outstanding for its discussions of hypothesis and its attempt at a basic theory. It is intended for professional psychiatrists.

ROSENZWEIG SAUL

Psychodiagnosis an introduction to the integration of tests in dynamic clinical practice. With the collaboration of Kate Levine Logan. New York Grune & Stratton 1949 380 p. illus. 22 cm. $5.00. 5088

Contents: Part i, Introduction: Clinical psychology as psychodiagnostic art. Part ii, The range of available instruments. Scope. Tests of general intelligence. Measures of intellectual deviation. Vocational aptitude and interest tests. Personality inventories. Projective methods. Part iii, The process of psychodiagnostic integration. The picture of the individual. Young woman with headaches concerning adult status. A child with problems of post-encephalitic origin. An adolescent with episodes of manic excitement. Part iv, A variety of applications: The province of clinical practice. Psychotic reaction to military service. Psychotic reactions. Evaluation of limited intellectual capacity. Defect of function from neurological damage. Maladjustment in later maturity. Somatic complaints as an expression of personality. Anxiety as a pattern of reaction. Casebook on an anonymous basis. Part v, The future. Psychodiagnosis as science. Bibliography. Index.

Note: This book attempts to integrate the objective tests of cognitive function and of personality with projective devices. By use of case materials in which several tests are compared and related to one another, the author demonstrates the clinical use of personality evaluations in obtaining a total picture of the individual. Primarily for graduate students and professional psychologists.

SARASON SEYMOUR B

The clinical interaction with special reference to the Rorschach. New York Harper & Brothers, 1954 425 p. illus. 21 cm. $5.00. 5089

Contents: Part i, Situational variables: Overt and covert behavior. The nature of the instructions and the purpose of the interaction. Stimulus task and time and place of interaction. The psychologist as a variable. Attitudinal factors related to previous learning. Prediction and situational similarity. Conditions for evaluating responses. Part ii, The Rorschach: The instructions. The external stimulus—location of response—color—shading. Internal factors—movement. The plain form (F) response and form quality. The content of the response. The psychologist. Part iii, Individual interpretation: Some major assumptions. Six cases. Bibliography. Author index. Subject index.

Note: Although the contents of some of the chapters of this book have implications for interactions between persons in general, it is primarily a study of variables in the interactions between therapist and patient in psychological interviewing and testing. For example, it is shown in the chapter on the psychologist as a variable that such factors as differences in age, social status and race between psychologist and patient appear to affect the patient's responses to test situations. Other variable factors, some of which are mentioned in the chapter titles of Part i as listed above, have equal significance and are fully discussed. In the second and major part of the book, the relevance of variables in testing patients with the Rorschach test are discussed specifically and in detail. In the chapter entitled, "Six cases," the Rorschach protocols of six actual cases are presented and are analyzed card by card. Although the book is of most value to those who use the Rorschach test, the author makes it clear that the problem of relations in clinical interactions between psychologist and patient is not confined to the Rorschach test but is important in most methods of interviewing and testing.

SARGENT HELEN D

The insight test a verbal projective test for personality study New York Grune & Stratton, 1953 276 p 24 cm. (The Menninger Clinic *monograph series no.* 10) $7.50. 5090

Contents: Part i, The test: Orientation. Stimulus material. The response data. Interpretation. Part ii, Illustrative protocols: Diagnosis and reporting. Schizophrenia. Paranoids. Hysterics. Obsessive-compulsives. Character disorders. Other conditions. Blind clients of social agencies. Concluding note. References. Appendices. Index.

Note: The projective test described in this monograph was originated by its author, who first introduced it in a monograph published in *Psychological monographs,* 57 1944. The test is designed to measure the subject's defense strategies, the self-concept, and various modes of seeking solutions to emotional problems. Its technique is fully explored in this book, which is based on seven years of clinical experience with it by the author and other psychologists. Numerous protocols of actual tests are included, and methods of scoring and interpretation are fully described.

SCHAFER, ROY

The clinical application of psychological tests diagnostic summaries and case studies. Foreword by David Rapaport The Menninger Foundation. New York International Universities Press, Inc., 1948. 346 p. 24 cm. (The Menninger Foundation monograph series. No. 6) $6.75 5091

Contents: Foreword, by D. Rapaport. General considerations. Diagnostic summaries. Case studies, border case studies. Concluding remarks. Scoring symbols for the Rorschach test. Index.

Note: This work is designed as a supplement, or sequel, to *Diagnostic psychological testing,* by D. Rapaport and others, and described above. It supplies condensed diagnostic summaries and numerous studies of individual cases in which batteries of tests were used, following the methods described in the earlier work.

SCHAFER ROY

Psychoanalytic interpretation in Rorschach testing theory and application. New York Grune & Stratton 1954 446 p. 24 cm. (Austen Riggs Foundation. Monograph series No. 3) $8 75 5092

Contents: Introduction. Interpersonal dynamics in the test situation. The response process. Thematic analysis. Criteria for judging the adequacy of interpretations. Introduction to the interpretation of defenses. Repression. Denial. Projection. Obsessive-compulsive defensive operations. Retrospect and prospect. Bibliography. Index.

Note: An introduction, but a substantial one, to the contributions that analysis has made and can make to the theory and interpretation of psychological tests. Although limited to Rorschach testing, implications for other methods of testing are indicated. It is addressed to such readers as clinical psychologists who have completed basic training in the administration, scoring, and interpretation of Rorschach tests, and who also have a basic knowledge of psychoanalytic theory. The chapter on Interpersonal dynamics in the test situation is a long one, well worth reading by all clinical psychologists. In the part of the book that begins with the chapter entitled "Introduction to the interpretation of defenses," the classic defense mechanisms, such as repression, projection, denial, and the obsessive-compulsive constellary of regression, isolation, reaction formation, and undoing, are discussed in relation to Rorschach test responses. These discussions include analyses of illustrative test records. A selected but extensive bibliography is included.

Contents. Part I History of the Rorschach method. Methodological problems. Part II: The technique of administration. General scoring problems. Scoring categories for location of responses. Scoring categories for determinants. Scoring categories for content. The technique of tabulation and the use of the record blank. Part III, General interpretation problems. The general personality structure. Intellectual aspects of personality Emotional aspects of personality Appendix to Part III. Part IV Clinical diagnosis. Intracranial organic pathology Dementia praecox. Mental deficiency Convulsive states. Psychoneuroses. Depressive states. Miscellaneous clinical problems. Bibliography 1946 supplement. Supplementary bibliography Index.

Note: A pioneering work on the clinical uses of the Rorschach technique. It was first published in 1942 and was reissued in 1946 with supplement as noted above. It is shorter and simpler than the two-volume *Developments in the Rorschach technique*, and therefore is more suited to use as an introduction to the subject. It contains a main bibliography covering the literature through September 1941. These bibliographies, however were combined in one alphabet and republished in the two-volume work.

LINDQUIST, EVERET FRANKLIN, editor
Educational measurement. Washington, D C. American Council on Education, 1951 819 p illus. 25 cm. $6 00 5082

Contents Foreword, by G. F Zook. Part one. The functions of measurement in education The functions of measurement in the facilitation of learning, by W W Cook. The functions of measurement in improving instruction, by R. W Tyler The functions of measurement in counseling, by J G. Darley and G. V Anderson. The functions of measurement in educational placement, by H. Chauncey and N Frederiksen. Part two, The construction of achievement tests Preliminary considerations in objective test construction, by E. F Lindquist. Planning the objective test, by K. W Vaughn. Writing the test item, by R. L. Ebel. The experimental tryout of test materials, by H. S. Conrad. Item selection techniques, by F B. Davis. Administering and scoring the objective test, by A. E. Traxler Reproducing the test, by G. Spaulding. Performance tests of educational achievement, by D G. Ryans and N Frederiksen. The essay type of examination, by J M. Stalnaker Part three, Measurement theory The fundamental nature of measurement, by I. Lorge. Reliability by R. L. Thorndike. Validity by E. E. Cureton. Units, scores, and norms, by J C. Flanagan. Batteries and profiles, by C. I. Mosier Index.

Note A reference work and textbook sponsored by the American Council on Education's Educational Advisory Committee, Measurement Book Project. The various chapters are written especially for the volume by recognized authorities on educational testing. The treatment is on the graduate level, and the book is of interest to graduate students in the field of educational testing and to psychologists, educators and others with professional interests in the subject. Extensive lists of references to the literature are included.

MAURER, KATHARINE (MATHER)
Intellectual status at maturity as a criterion for selecting items in preschool tests Minneapolis The University of Minnesota Press, 1946 166 p illus 23 cm. (University of Minnesota. The Institute of Child Welfare. Monograph series no XXI) $2 50 5083

Contents Introduction. The problem. The subjects of the terminal status study Collection and analysis of the data. Validation. Discussion of the results. Interpretation. Bibliography Appendices. Interests questionnaire. Directions for administering the Minnesota preschool scale, forms A and B Graphs showing the percentage of subjects (N = 180) passing each item of the Minnesota preschool scale, forms A and B at each of nine age levels. Indexes.

Note A study intended to aid psychologists in preparing tests for predicting the future psychological development of children. It is based mainly on measurements made with the Wells revision of the Army Alpha test of 226 young men and women between the ages of 16½ and 22 years, all of whom had been tested before the age of six with the Minnesota pre-school scales. Analysis of results from the army test conclusively showed that only about one half of the items found in the usual type of children's predictive test have any significance for long-range prediction of the child's probable development. Much of the information is given in tabular or graphical form.

MICHEELS, WILLIAM JORDAN, AND M RAY KARNES
Measuring educational achievement. New York McGraw Hill Book Company, Inc., 1950 496 p. illus 24 cm. (McGraw Hill series in education, Harold Benjamin, consulting editor) $5 75 5084

Contents. An introduction to measurement. Kinds and types of evaluating instruments. Purposes of evaluation. What makes a good test. General principles of test construction. Multiple-choice items. True-false items. Matching items. Recall items. Modified, adapted, and combined items. Object tests. Manipulative-performance tests. Observation and evaluation. Evaluating major projects. Interpreting test data and assigning marks. Analyzing and improving tests. Improving your instruction—a challenge. Index.

Note: General aspects of the use of tests in measuring educational achievements are discussed in the first three chapters of this book for professional teachers. The remainder is devoted to the principles and techniques of test construction. The purpose is to aid teachers in constructing tests and using them. Many of the examples are of tests suitable for use in connection with vocational education. However the general principles stated are generally applicable to educational tests.

PASCAL, GERALD R., AND BARBARA J SUTTELL
The Bender Gestalt test, quantification and validity for adults. Foreword by David G Wright. New York Grune & Stratton, 1951 274 p. illus. 26 cm. $6.50 5085

Contents. Part I, Quantification: Introduction. Administration and scoring. Reliability Test standardization. Test validity Part II, Clinical use of the Bender-Gestalt test: Introduction. The records of children and those with cortical deficit. The Bender-Gestalt test and psychogenic disorders. Appendix. Scoring manual. Index.

Note: In this book, critical examination of techniques in the administration of the Bender-Gestalt test to persons suffering from mental or nervous disease and of the validity of test results is combined with practical manual on the clinical use of this test and the scoring of results. One of the conclusions of the authors is that "clinical judgment must be added to the quantitative score." However more than half of the space in the book is occupied by the scoring manual and the atlas of scored records. There is a three-page list of references.

PHILLIPS, LESLIE, AND JOSEPH G SMITH
Rorschach interpretation advanced technique. New York Grune & Stratton, 1953 385 p. illus 24 cm. $8 75 5086

Contents. Location choice. Form level. The color response. The movement response. Brilliance, texture, vista and achromatic color responses. Content analysis. Attitudes, role playing and life theme. The concept of shock Sequence analysis. A method of interpretation. Case analysis. Appendix. Index.

Note An advanced book for professional workers with some previous experience in Rorschach testing It includes thorough discussions of such aspects as location choice, form level, and color response. Numerous examples point up the discussion. Some of the postulates and interpretations are included only because the authors have found them useful In fact, they warn, "Unfortunately few of the relationships which are asserted have been corroborated most represent guessed-at hunches." The chapter entitled "Case analysis" contains very detailed analysis of part of Rorschach protocol. Bibliographies are included in the chapters.

RAPAPORT, DAVID AND OTHERS
Diagnostic psychological testing the theory statistical evaluation and diagnostic application of a battery of tests Chicago The Year Book Publishers Inc. 1945–46 2 v illus. 23 cm. (The Menninger Clinic monograph series. No 3) $8 00 per vol set, $15 00. 5087

[illegible] evaluation procedures. Inadequacies in the statement of educational goals. Steps in planning evaluation instruments. Just [illegible] the educational goals. Assigning weights to the goals. The selection of measuring techniques. Objective-type test questions: Origin [illegible] of the objective test. The completion item. The true-false item. Rules for constructing multiple-choice test questions. The control of the difficulty of test questions. The assembly, administration, and scoring of the test. The significance of test scores. Basic considerations in developing [illegible] grading system. The validity of achievement tests. The reliability of teacher-made tests. *Appendix: Objective methods of scoring free-answer examinations.*

Note: A brief and informative guide for teachers. It tells [illegible] objective achievement tests can measure, what they cannot be expected to measure, and [illegible] hat are the best methods of constructing such measurement. Also, it provides teachers with [illegible] techniques for defining educational goals in terms which make the extent to [illegible] hich they are achieved [illegible] measurable functions. However, the author emphasizes that many of the most important outcomes of education are not subject to measurement by the objective examination.

United States. Office of Strategic Services

Assessment of men selection of personnel for the Office of Strategic Services. New York, Rinehart & Company, Inc., 1948. 541 p. illus. 24 cm. $6.00. 5098

Contents: The nature of the task. Principles of assessment. Assessment at S. Procedures—Formulations and ratings—Analysis of [illegible]. Assessment at W WS, and F Assessment [illegible]. The [illegible] of assessment. Conclusions and recommendations. Appendixes: Assessment populations. The interrelationships among the [illegible]. International [illegible]. Index.

Note: A detailed, critical review of the methods developed and [illegible] by the assessment staffs of the United States Office of Strategic Services in appraising candidates for difficult and often hazardous assignments during World War II. The problems of assessing the abilities of men under these conditions are discussed rather fully. The tests [illegible] hich were devised to ascertain the mental, emotional, and physical qualities of the candidates are described in detail. Some comparisons between the predictions made on the basis of the assessment procedure and the achievements of the men on their assignments are made. The book is of special interest to psychologists and psychiatrists interested in the study and measurement of personality.

Wechsler, David

Manual for the Wechsler adult intelligence scale. New York. The Psychological Corporation, 1955. 97 p. 23 cm. $2 75 5099

Contents: Introduction. Standardization of the scale. General testing considerations. Directions for administering the tests. Scoring criteria and sample answers. Table of scaled score equivalents of raw scores. Table of IQ equivalents of sums of scaled scores. Appendix.

Note: The Wechsler-Bellevue intelligence scale has been widely used both in the testing of intelligence of adults and in clinical psychology since its introduction in 1939. The Wechsler adult intelligence scale (WAIS) is an extended and modified version of it. This publication is [illegible] reference handbook addressed to psychologists who use the WAIS. It contains [illegible] discussion of the rationale of the Wechsler scales, an analysis of the techniques of standardization of the WAIS scale, directions for administering the tests of the WAIS, scoring criteria and related aids to interpreting test results.

Wechsler, David

The measurement of adult intelligence. Third edition. Baltimore The Williams & Wilkins Company 1944 258 p. illus. 23 cm. $3.50. 5100

Contents: Part I, The nature and classification of intelligence. Nature of intelligence. Need for an adult intelligence scale. Concepts of mental age and I.Q. Classification of intelligence. Concept of mental deficiency. The problem of mental deterioration. Part II. The Bellevue intelligence scales. Selection and description of tests. Population used in standardizing tests. Standardization and [illegible]. Limitations and special merits. Diagnostic and clinical features. Part III. Manual of Bellevue Intelligence tests. Appendices. I.Q. tables. Index.

Note. A monograph summarizing the results of the author's tests for adult intelligence developed at Bellevue Psychiatric Hospital, New York City and covering the fundamental problems and concepts, the detailed description of the tests, the diagnoses and results and their interpretation. The third edition includes new material on the clinical applications of the results and new data on mental deterioration, as well as new tables and test data in the appendix.

Wechsler, David

Wechsler intelligence scale for children. New York The Psychological Corporation, 1949 114 p. illus. 23 cm. $2.50. 5101

Contents. The rationale of the children [illegible] scale. Standardization statistics. General testing considerations. Table for converting scaled scores into IQs. Scaled score equivalents for raw scores. Directions for administering the tests. Appendixes: General comprehension—scoring criteria. Similarities—scoring criteria. Vocabulary—scoring criteria. Mazes—error guide. *Equivalent test ages for the WISC. Formulas table.*

Note. The Wechsler Intelligence Scale for Children (WISC) consists of 10 tests all of which are ordinarily given to every subject tested. This is the manual for the use of the examiners [illegible] to administer the tests. As the table of contents indicates there is some background information about the tests, but most of the manual is devoted to techniques of administering and scoring the tests in the Scale.

Welsh George Schlager, and W Grant Dahlstrom, editors

Basic readings on the MMPI in psychology and medicine. Minneapolis University of Minnesota Press, 1956. 656 p. illus. 26 cm. $8.75 5102

Contents (abridged) List of contributors. Section I, Theory. Section II, Construction. Section III, Coding. Section IV New scales. Section [illegible] Profile analysis. Section VI, Diagnostic problems. Section VII, Psychiatric problems. Section VIII, Medical problems. Section IX, Therapy. Section X, General personality. Bibliography. Supplementary references. Index.

Note A collection of 66 articles on the Minnesota Multiphasic Personality Inventory deemed to constitute "the major research on clinical developments in the use of the MMPI during the last fifteen years." The majority are reprints from journals and books, however, several articles are published in this volume for the first time. These include some of the articles on the derivation of the basic scales. For all the reprinted articles references are given to the original publications. In the place of separate reference lists for the individual papers, the authors have supplied [illegible] comprehensive bibliography [illegible] hich is essentially complete through December, 1954, for literature on the MMPI and contains [illegible] separate list the references in the articles to literature not pertaining to the MMPI. The collection is [illegible] basic one for all who make use of this important testing procedure.

EDUCATIONAL PSYCHOLOGY

Blair Glenn Myers and others

Educational psychology By Glenn Myers Blair R. Stewart Jones, and Ray H. Simpson. New York The Macmillan Company 1954 601 p. illus. 22 cm. $5.50. 5103

Contents: Part I, Introduction. Psychology and the work of the teacher Part II, Growth and development: The biological and social bases of behavior. Growth and development during childhood. The adolescent period. Part III, Learning: An orientation to learning. Readiness for learning. Motivation—*the forces which energize and direct behavior.* Interests and attitudes. Organization of learning and teaching. The transfer and application of learning. The social psychology of teaching and learning. Discovering and overcoming special difficulties in learning. Part IV Adjustment and guidance: Basic processes of adjustment. Problems of school discipline. Promoting the personal and social adjustment of pupils. Studying the individual child. Part [illegible] Measurement and evaluation: Diagnostic tools. Interpreting and using test results. Marking, reporting, and promoting. Appraising the work of the school. Part VI, The psychology of the teacher: Professional growth of the teacher. Personal and emotional adjustment of the teacher. Indexes.

SHNEIDMAN, EDWIN S

Thematic test analysis. With the collaboration of Walther Joel and Kenneth B Little. Foreword by Henry A. Murray New York Grune & Stratton, 1951 320 p illus 26 cm $8 75 5093

Content (abridged): Introduction. Part I, Thematic test data. Thematic apperception test. Part II, Techniques of thematic test analysis, by M. Arnold, B Aron, L. Bellak, L. Eron, R. Fine A. A. Hartman, R. R. Holt, W Joel, D Shapiro, S. Klebanoff, S. Korchin, J L Lasaga, J B. Rotter & Jessor H. D Sargent, P M. Symonds, and R. K. White. Part III, Additional test data Rorschach test, interpreted by B Klopfer Wechsler Bellevue scale, interpreted by H. Kitzinger Minnesota multiphasic personality inventory interpreted by H. Grayson. Draw a person, interpreted by K. Machover. Bender-Gestalt drawings, interpreted by M. L. Hutt. Part IV Behavioral data. Psychiatric case history abstract (V.A. Neuropsychiatric Hospital) Course in neuropsychiatric hospital. Psychiatric follow-up interview Part V Synthesis and summary Bibliography Index.

Note. This unusual book is built around the detailed interpretations by individual psychologists of a thematic apperception test (TAT) and a complementary make a picture story test (MAPS) administered to one mentally disturbed person who was unknown to the contributing psychologists. The various analyses of these two tests are supplemented by single interpretations of the responses to other tests by the same patient, by an abstract of the actual case history and by summaries by the book's authors. The value of the book lies in its illustrations and discussions of the analytical methods used on the same test responses by various graduate psychologists.

STEIN, MORRIS I.

The thematic apperception test, an introductory manual for its clinical use with adults Revised edition. Reading Mass. Addison Wesley Publishing Company, Inc., 1955 365 p 24 cm. $7 50 5094

Contents The TAT pictures and their common stories. Administration of the TAT Technique of clinical analysis of the TAT Additional factors to be studied. Technique of interpretation. A professional man. A woman comes for therapy A male patient starts therapy A male patient seeks job training. A schizophrenic before and after insulin shock and psychotherapy The protocol of a deteriorated organic. A male student before and after psychoanalysis. Index.

Not An established manual for graduate students of psychology and practicing psychologists who have had some training in personality analysis and are familiar with clinical practice. T facilitate application of the thematic apperception test, the author worked out technique of analysis which avoids the difficulty of the original "need-press" system and terminology The exposition proceeds systematically from the description of the test and the most common responses through discussion of clinical analysis and interpretation. The first edition of the book published in 1948 covered only the pictures administered to men. In the second edition the scope of the book was extended to include the pictures administered to women. In addition, number of cases—all but one of those listed in the above contents—which illustrate various applications of the TAT were added

SUPER, DONALD EDWIN

Appraising vocational fitness by means of psychological tests. New York Harper & Brothers, 1949 727 p 24 cm. $7 00 5095

Contents (abridged) Testing and diagnosis in vocational guidance. Testing and prediction in vocational selection Methods of test construction, standardization, and validation. The nature of aptitudes and aptitude tests. Test administration and scoring. Intelligence. Proficiency Clerical aptitude—perceptual speed. Manual dexterities. Mechanical aptitude. Spatial visualization. Aesthetic judgment and artistic ability Musical talents. Custom-built batteries for specific occupations. Standard batteries with norms for specific occupations. Measures of interests. Personality attitudes, and temperament. Appraising individual vocational promise. Using test results in counseling. Preparing reports of test results. Illustrative cases—data and counseling. Appendix Statistical concepts. Prediction and probability Test publishers and scoring services. Bibliography Index.

Note. A comprehensive treatise in which the theory of the use of tests in vocational counseling, the principles of test construction, techniques in test administration and scoring, and other general aspects are covered, along with descriptions of individual tests. One of the most useful features is the evaluating of particular tests in the light of accumulated experience with them. References to the original publication of the research studies on which the evaluations are based are carefully given. The book is addressed to persons with professional interests in the use of tests in vocational aptitude measuring and vocational counseling. Case histories illustrating the application and use of particular tests are included. The bibliography contains 955 references to books and periodicals.

THORNDIKE, ROBERT L, AND ELIZABETH HAGEN

Measurement and evaluation in psychology and education New York John Wiley & Sons, Inc., 1955 575 p illus 23 cm. $5.50. 5095A

Contents. Historical and philosophical orientation. Overview of measurement methods. The teacher's own tests. Preparing objective tests. Elementary statistical concepts. Qualities desired in any measurements procedure. Norms and units for measurement. Where to find information about specific tests. Standardized tests of intelligence or scholastic aptitude. The measurement of special aptitudes. Achievement tests. Behavioral measures of personality The individual as others see him. Questionnaires and inventories for self-appraisal. Projective tests. Planning school testing program. Marking and reporting. Measurement in educational and vocational guidance. Tests in the selection of personnel. Measurement in diagnosis and therapy Appendix. Index.

Note. A basic, professional-level treatise and reference book designed "for the person who is going to use and interpret tests. The authors' main thesis for any measurement project is the backbone of the book, defining just what it is we wish to measure and determining what operations will serve to measure it. T this end, general measurement procedures and concepts are described, types of tests are discussed, and the student is directed to sources of further information about special tests. The authors attempt to avoid any feeling of absoluteness about testing and evaluating procedures, preferring to encourage healthy skepticism in interpreting test results. Numerous helpful charts and tables, an appendix on specific tests, and chapter on the planning of test program for school are included. The authors are members of the faculty of Teachers College, Columbia University

TOMKINS, SILVAN SOLOMON

The thematic apperception test the theory and technique of interpretation with the collaboration of Elizabeth J Tomkins. New York Grune & Stratton 1947 297 p. 23 cm. $5 00 5096

Contents. History and development of the thematic apperception test. The technique of administration. The scoring scheme. Introduction to the technique of interpretation. Level analysis. Diagnosis of personality—the region of the family Diagnosis of personality—the region of love, sex, and marital relationships. Diagnosis of personality—the region of social relationships. Diagnosis of personality—work and vocational setting. Diagnoses and psychotherapy References. Index.

Note. The TAT method of psychiatric diagnosis—by interpretation of the individual's response to set of "story" pictures—is here considered by psychologist he worked closely with the test from its introduction. Supposedly designed for the uninitiated as well as the professional psychologist, the work none the less presumes at least basic understanding of psychiatric procedure on the part of the reader. Although the first three chapters are of an explanatory nature, the remainder is devoted largely to interpretation and diagnosis. Detailed records of individual reactions to the pictures are followed by the author' evaluation of these and in many cases by corroborath diagnoses from other tests.

TRAVERS, ROBERT MORRIS WILLIAM

How to make achievement tests. New York The Odyssey Press 1950 180 p. illus. 21 cm. $2.25 5097

Contents (abridged) Introduction Measurement and evaluation. The expanding meaning of achievement. Systematic versus unsys-

Contents: Part I, Introduction: The nature and function of psychology in education. Part II, Human development during the first two decades: The fundamentals of human development. Physical, mental, and emotional development. Personal and social development during childhood. Personal and social development during adolescence. Part III, Adjustment in teaching and learning: The dynamics of human behavior and learning. Personal and social bases of adjustment. Adjustment through the development of self-discipline. Part IV, The educative process: Learning—principles, theories, and transfer values. Retention and effective study in learning. The acquiring of skill competence. Thinking and problem-solving. Individual differences in learning. Part V, Evaluating and reporting: The study of the learner in the classroom. Functions and techniques of evaluation. Interpretation of learner progress. Appraisal and reporting of pupil progress. Part VI, The role of the teacher in education: Development of teaching effectiveness. Adjustment aspects of teaching. Teacher counseling and learner adjustment. Appendix. Author index. Subject index.

Note: A well-balanced, introductory text in the psychology of education. It is designed for the instruction of student-teachers. There is some emphasis on the importance of understanding on the part of the teacher of the psychological problems of young people. However, as indicated by the chapter titles, the customary topics of first-year texts in educational psychology are all covered. The authors are members of the faculty of the Department of Education of Brooklyn College.

DEESE, JAMES

The psychology of learning. New York McGraw Hill Book Company Inc., 1952 398 p. illus. 24 cm. (McGraw Hill publications in psychology: Clifford T Morgan consulting editor) $6.00 5110

Contents: Introduction. Reinforcement and learning. The nature of extinction. Stimuli in learning and the process of discrimination. Motivation and learning. Negative reinforcement and punishment. Serial learning and the chaining of responses. Factors affecting rate of complex learning. Retention. Forgetting. Transfer of training. Efficiency in human learning. Thinking and problem solving. Learning and the nature of the learner. Emotion and conflict. Physiological problems in learning. Current theoretical problems. References. Author index. Subject index.

Note: A textbook designed for college use. It is introductory to the psychology of learning but is intended for students who have completed at least a course in basic psychology. It provides a broad survey of the current status of the psychology of learning, both the accumulated knowledge and the unsolved problems. Significant experimental studies are described and evaluated, and references are included to the original publications. The bibliography lists approximately 700 literature references. The author is Assistant Professor of Psychology in Johns Hopkins University.

GARRISON KARL CLAUDIUS

Growth and development. With a chapter by Florene M. Young and a chapter by Florence Hensler New York Longmans, Green and Company 1952 559 p. illus. 22 cm. $5.00. 5111

Contents: Part I, Introduction. Studying child growth and development. Biological inheritance and prenatal development. The period of infancy. Some fundamental principles of growth. Part II, Aspects of growth: Physical growth and health. The development of motor skills. Emotional growth and control. Intelligence—growth and measurement. Language growth and development, by F. M. Young. Growth in knowledge and understanding. Growth in creative expression. The development of social behavior and attitudes, by F. Hensler. Part III, Personality development: Changes of interests with age. Personality development—its nature and evaluation. Personality development—conflicts and adjustment. Mental hygiene of childhood. From childhood to adolescence. From adolescence to maturity. Appendix. Author index. Subject index.

Note: In this book on the physical growth and mental development of children from infancy through adolescence, fundamental knowledge is adequately presented, and there is emphasis on those aspects of the subject which are of special concern to teachers. For example, stated reasons for adolescents leaving school before graduating are discussed. The book is based on a variety of research reports and other professional publications, and these are cited in footnote references.

GARRISON, KARL CLAUDIUS

The psychology of exceptional children. Revised edition. New York The Ronald Press Company 1950. 517 p. illus. 21 cm. $5.00. 5112

Contents: Part I, Introduction. Our children—their assets and liabilities. Fundamental principles of development. Part II, Studying the individual child: The child's physical development. The child's capacities, interests, and achievements. The child's personality. Part III, Mentally retarded children: Characteristics of the mentally retarded. Special disabilities. Curricula provisions for the mentally retarded. Social and personal development of the mentally handicapped. Part IV, Gifted children: Characteristics of the mentally gifted. Psychology of special abilities. School provisions for the gifted. Personal and social development of the gifted. Part V, The physically handicapped child. The problem of defective vision. Children who are hard of hearing. The speech defective child. The crippled child. Children of lowered vitality. Part VI, Emotionally and socially maladjusted children: Children with emotional or adjustive difficulties. Socially maladjusted and delinquent children. Nervous and psychoneurotic children. The hygiene of childhood. Appendix. Author index. Subject index.

Note: A standard work which is used as a text in college courses and also as a guide for teachers, social workers, and parents' groups. Its scope is children whose physical and emotional make-up set them apart in one way or another from the average child. Literature references are included in the form of footnotes and also as selected lists at the ends of chapters. In this revision the purpose and organization of the book are the same as in the first edition, but the incorporation of new case studies and the results of investigations conducted by the author and other workers in the field account for more than 160 additional pages.

GATES ARTHUR IRVING AND OTHERS

Educational psychology by Arthur I Gates, Arthur T Jersild T R. McConnell and Robert C. Challman. Third edition. New York The Macmillan Company 1948 818 p. illus. 21 cm. $5 75 5113

Contents: Introduction—the scope of educational psychology. The development of behavior—introductory. Physical and motor development. Emotional development. Development of social behavior. Mental development. The nature and measurement of intelligence. The practical uses of intelligence and aptitude tests. The general nature of learning. Principles of guidance in learning. The development of meanings. Reasoning and problem solving. Transfer of training. Appraising progress by means of tests and other devices. Appraising the school program through study of pupils as persons. The adjustment of the individual. The adjustment process—tension reduction. Mental health hazards of the school child. Guidance of the individual child. The mental health of the teacher. Index of authors. Subject index.

Note: A standard and unusually successful introductory presentation of the facts and principles of educational psychology. The book has evolved from the senior author's *Psychology for students of education*, 1923 but except for the fact that both works were designed for student teachers, there is little similarity. The work was recast in essentially its present form, and the collaborating authors joined in its preparation, in the edition published in 1942. In preparing this edition the organization of the 1942 text was not changed fundamentally but many revisions were made nevertheless. The chapter, "Appraising the school program through study of pupils as persons," was added; and the chapter, "The adjustment process—tension reduction," constitutes a reworking and expansion of material which in the previous edition was included in the chapter just preceding. A considerable number of the other chapters have been revised in part, and numerous additions have been made to the bibliography.

GUTHRIE, EDWIN RAY AND FRANCIS F POWERS

Educational psychology New York The Ronald Press Company 1950. 530 p. illus. 21 cm. (A volume in the Douglass series in education edited by Harl R. Douglass) $5.00. 5114

Contents (abridged): Part I, Introduction: The challenge of modern education to the psychologist. The definition and meaning of

Note. A textbook designed for use in first courses in educational psychology offered to student teachers. It provides balanced and practical view of the subject. Extensive use is made of examples f actual classroom experiences to point up theories. Footnote efer ences are given to publications cited in the text and, in addition, the chapters contain lists of references for further reading. The authors are members f the faculty of the Uni ersity of Illinois.

BUSH, ROBERT R , AND FREDERICK MOSTELLER

Stochastic models for learning New York John Wiley & Sons, Inc., 1955 365 p illus 24 cm (Wiley publications in statistics. Walter A Shewhart, editor) $9 00 5104

Contents Part I, The mathematical system and the general model: The basic model. Stimulus sampling and conditioning. Sequences of events. Distributions of response probabilities. The equal alpha condition. Approximate methods. Operators with limits zero and unity Commuting operators. Part II, Applications. Identification and estimation. Free-recall verbal learning. Avoidance training. An experiment on imitation. Symmetric choice problems. Runway experiments. Evaluations. Tables. Glossary of symbols frequently used. Index.

Not A pioneering work on the application of the stochastic model concept to the analysis of data from experiments on learning. An underlying thesis is that learning is essentially stochastic in that each experience alters the probabilities of subsequent responses. The book is addressed primarily to experimental psychologists and although expressed largely in mathematical conventions, deep knowledge of advanced mathematics and probability theory on the part of the reader is not assumed. Instead, the necessary parts of matrix theory difference equations, linear operators, etc. are introduced as needed. A general model is presented and its mathematical properties are examined in the first part of the book In the second part, the model is applied to well-known experimental findings in the areas of learning theory which are named in the chapter titles. The advantages of the stochastic model over curve-fitting are discussed in the terminal chapter Literature references are supplied.

COLE, LAWRENCE EDWIN, AND WILLIAM F BRUCE

Educational psychology Yonkers, N Y World Book Company, 1950 768 p illus. 23 cm. $6.25 5105

Contents (abridged) Part one, Life styles in their social settings: The study of educational psychology The human person—his style of life. Part t o, The development of personality—analysis and integration The physical growth of the individual. The development of effective intelligence. The emotions—energies of man. Motives—from drives to purposes. Growth and development in the American culture. The development of the self into mature person. Part three, The psychology of learning in free society: Learning by conditioning responses. Learning by trial and error Learning by insight—Gestalt psychology The psychology of thinking—a new interpretation of learning. The creative imagination—the expressive person. Part four Putting psychology to work in the schools The teacher's task and the barriers. Studying and guiding development. Appraising development and learning—measurement in education. Bibliography Index of names. Index of subject matter

Not A broad view of educational psychology is afforded in this introductory text. It is not limited to the psychology of the learning process but instead includes discussions of pertinent topics in social psychology and the psychology of personality The organization of the book is somewhat unconventional also. For instance, there are numerous quoted passages in which social backgrounds are dramatically presented. The authors' style is easy to read even in those parts of the book devoted to the technical aspects. Lists of "Further reading" for the students are included in the chapters and at the end of the book there is an extensive general bibliography A revised edition was scheduled for publication in 1958.

COMMINS W D , AND BARRY FAGIN

Principles of educational psychology Second edition New York The Ronald Press Company 1954 795 p illus. 21 cm. $6 00 5106

Contents Introduction. Part i, Psychology and education Our psychological heritage. Some principles of mental development. Part ii, Human growth and development Human variability and growth. Growth and maturation. Intellectual development. Social backgrounds of child development. Social and emotional development. Part iii, Individual differences in the school. Measuring abilities. The practical role of intelligence. Personality and school adjustment. Providing for individual differences. Part iv The conditions of learning: The learning process. Learning as perceiving. Learning as goal activity Learning as a social process. The transfer of learning. Part v The forms of learning: Habits and skills. Memory Thinking processes. Problem solving. Learning and personal adjustment. Index of names. Index of subjects.

Note. Designed for introductory courses in educational psychology offered to students who are preparing for careers in teaching, the book provides a substantial survey of the subject. The chapter titles illustrate its broad scope. Basic aspects such as human development, individual differences, and learning theory are emphasized. Extensive bibliographies are included. The first edition was published in 1937 This second edition is the result of a very extensive revision and enlargement. A very wide range of material, most of it derived from research studies published since the first edition was written, has been incorporated in the text, and the bibliographies have been revised. The senior author is a member of the faculty of Catholic University of America.

CRONBACH, LEE J

Educational psychology New York Harcourt, Brace and Company, 1954 628 p. illus. 24 cm $8 00 5107

Contents (abridged) Part i, Psychology and school problems: How psychology contributes to education. An introduction to the learning process. Part ii, Readiness and its development The stream of development. Assessing readiness—personality and motivation—abilities. Adapting schooling to individual differences. Part iii, Acquiring ideas, attitudes, and skills. Transfer of learning. Learning of concepts and principles. Identification and the learning of attitudes. Practice and the learning of skills. Part iv Planning, motivation, and evaluation, Part v Emotional learning: Reaction to thwarting. Personal integration. Personality structure and character development. Author index. Subject index.

Note. The psychology of learning, or the nature of the learning process, is the principal subject of this introductory textbook. The book is written in lucid style and is made interesting and at the same time effective by the inclusion of many illustrated examples of students' reactions to teaching and of other influences that affect students' readiness to learn and their acceptance of the teacher's efforts. The author is member of the faculty of the University of Illinois.

CROW, LESTER D , AND ALICE CROW

Educational psychology New York American Book Company 1954 599 p illus. 23 cm. $5 25 5108

Contents (abridged) Part i, Introduction The nature and scope of educational psychology The teacher and the educative process. Part ii, Growth and development. Part iii, The learner's potentialities: Intelligence and its measurement. Aptitude and aptitude testing. Personality traits and their evaluation. Educational implications of individual differences. Part iv, General principles of learning: Attitudes, interests, and motivation. Acquiring motor skills and knowledge. Reflective and creative thinking. Importance of transfer of training. Part Evaluation of learner achievement: Nature and scope of educational evaluation. Simple statistics in education. Part vi, Psychology of learning areas Acquiring the tools of comprehension and expression. Acquiring mathematical concepts. Developing an understanding of the natural and social sciences. The development of appreciation. Educating for health and safety Vocational exploration and preparation. Part vii, Life adjustments: Adjustment of exceptional individuals. Behavior drives and adjustment. Applying mental hygiene to individual adjustment. Author index. Subject index.

Note An introductory textbook written by two faculty members of the Department of Education of Brooklyn College. It is used for the instruction of students in teachers' colleges. It offers broad modern view of educational psychology including basic knowledge derived from experimental psychology References to source publications are included as footnotes and lists of "suggested readings" are included at the ends of chapters.

CROW, LESTER D , AND ALICE CROW

Human development and learning New York American Book Company 1956 578 p illus. 23 cm. $5.50 5109

Contents: Part I, Introduction: The nature and function of psychology in education. Part II, Human development during the first two decades: The fundamentals of human development. Physical, mental, and emotional development. Personal and social development during childhood. Personal and social development during adolescence. Part III, Adjustment in teaching and learning: The dynamics of human behavior and learning. Personal and social bases of adjustment. Adjustment through the development of self-discipline. *Part IV, The educative process:* Learning—principles, theories, and transfer values. Emotion and effective study in learning. The acquiring of skill competence. Thinking and problem-solving. Individual differences in learning. Part V, Evaluating and reporting: The study of the learner in the classroom. Functions and techniques of evaluation. Interpretation of learner progress. Appraisal and reporting of pupil progress. *Part VI,* The role of the teacher in education: Development of teaching effectiveness. Adjustment aspects of teaching. Teacher counseling and learner adjustment. Appendix. Author index. Subject index.

Note: A well-balanced, introductory text in the psychology of education. It is designed for the instruction of student-teachers. There is some emphasis on the importance of understanding on the part of the teacher of the psychological problems of young people. However, as indicated by the chapter titles, the customary topics of first-year texts in educational psychology are all covered. The authors are members of the faculty of the Department of Education of Brooklyn College.

DEESE, JAMES

The psychology of learning. New York McGraw Hill Book Company Inc., 1952 398 p. illus. 24 cm. (McGraw Hill publications in psychology: Clifford T Morgan consulting editor) $6.00 5110

Contents: Introduction. Reinforcement and learning. The nature of extinction. Stimuli in learning and the process of discrimination. Motivation and learning. Negative reinforcement and punishment. BUSH, ROBERT R., AND FREDERICK MOSTELLER

Stochastic models for learning New York John Wiley & Sons, Inc., 1955 365 p illus. 24 cm. (Wiley publications in statistics. Walter A Shewhart, editor) $9 00 5104

Contents Part I, The mathematical system and the general model The basic model. Stimulus sampling and conditioning. Sequences of events. Distributions of response probabilities. The equal alpha condition. Approximate methods. Operators with limits zero and unity Commuting operators. Part II, Applications. Identification and estimation. Free-recall verbal learning. Avoidance training. An experiment on imitation. Symmetric choice problems. Runway experiments. Evaluations. Tables. Glossary of symbols frequently used. Index.

Note. A pioneering work on the application of the stochastic model concept to the analysis of data from experiments on learning. An underlying thesis is that learning is essentially stochastic in that each experience alters the probabilities of subsequent responses. The book is addressed primarily to experimental psychologists and although expressed largely in mathematical conventions, a deep knowledge of advanced mathematics and probability theory on the part of the reader is not assumed. Instead, the necessary parts of matrix theory difference equations, linear operators, etc. are introduced as needed. A general model is presented and its mathematical properties are examined in the first part of the book In the second part, the model is applied to well-known experimental findings in the areas of learning theory which are named in the chapter titles. The advantages of the stochastic model over curve-fitting are discussed in the terminal chapter Literature references are supplied.

COLE, LAWRENCE EDWIN, AND WILLIAM F BRUCE

Educational psychology Yonkers N Y World Book Company, 1950 768 p illus. 23 cm. $6 25 5105

Contents (abridged) Part one, Life styles in their social settings The study of educational psychology The human person—his style of life. Part two, The development of personality—analysis and integration The physical growth of the individual. The development of effective intelligence. The emotions—energies of man. Motives—from drives to purposes. Growth and development in the American culture. The development of the self in a mature person. Part three, The psychology of learning in a free society: Learning by conditioning responses. Learning by trial and error Learning by insight—Gestalt psychology The psychology of thinking—a new interpretation of learning. The creative imagination—the expressive person. Part four Putting psychology to work in the schools The teacher's task and the barriers. Studying and guiding development. Appraising development and learning—measurement in education. Bibliography Index of names. Index of subject matter

Note A broad view of educational psychology is afforded in this introductory text. It is not limited to the psychology of the learning process but instead includes discussions of pertinent topics in social psychology and the psychology of personality The organization of the book is somewhat unconventional also. For instance, there are numerous quoted passages in which social backgrounds are dramatically presented. The authors' style is easy to read even in those parts of the book devoted to the technical aspects. Lists of "Further reading" for the students are included in the chapters and at the end of the book there is an extensive general bibliography A revised edition was scheduled for publication in 1958.

COMMINS, W D AND BARRY FAGIN

Principles of educational psychology Second edition New York The Ronald Press Company, 1954 795 p illus. 21 cm $6 00 5106

Contents Introduction. Part I, Psychology and education Our psychological heritage. Some principles of mental development. Part II, Human growth and development Human variability and growth. Growth and maturation. Intellectual development. Social backgrounds of child development. Social and emotional development. Part III, Individual differences in the school. Measuring abilities. The practical role of intelligence. Personality and school adjustment. Providing for individual differences. Part IV The conditions of learning The learning process. Learning as perceiving. Learning as goal activity Learning as a social process. The transfer of learning. Part V The forms of learning Habits and skills. Memory Thinking processes. Problem solving. Learning and personal adjustment. Index of names. Index of subjects.

Note: Designed for introductory courses in educational psychology offered to students who are preparing for careers in teaching, this book provides a substantial survey of the subject. The chapter titles illustrate its broad scope. Basic aspects such as human development, individual differences, and learning theory are emphasized. Extensive bibliographies are included. The first edition was published in 1937 This second edition is the result of very extensive revision and enlargement. A very wide range of material, most of it derived from research studies published since the first edition was written, has been incorporated in the text, and the bibliographies have been revised. The senior author is a member of the faculty of Catholic University of America.

CRONBACH, LEE J

Educational psychology New York Harcourt Brace and Company, 1954 628 p. illus. 24 cm. $8 00 5107

Contents (abridged) Part I, Psychology and school problems How psychology contributes to education. An introduction to the learning process. Part II, Readiness and its development: The stream of development. Assessing readiness—personality and motivation—abilities. Adapting schooling to individual differences. Part III, Acquiring ideas, attitudes, and skills. Transfer of learning. Learning of concepts and principles. Identification and the learning of attitudes. Practice and the learning of skills. Part IV Planning, motivation, and evaluation, Part V Emotional learning: Reaction to thwarting. Personal integration. Personality structure and character development. Author index. Subject index.

Note The psychology of learning, or the nature of the learning process, is the principal subject of this introductory textbook. The book is written in a lucid style and is made interesting and at the same time effective by the inclusion of many illustrated examples of students' reactions to teaching and of other influences that affect students' readiness to learn and their acceptance of the teacher's efforts. The author is a member of the faculty of the University of Illinois.

CROW, LESTER D , AND ALICE CROW

Educational psychology New York American Book Company, 1954 599 p illus. 23 cm. $5 25 5108

Contents (abridged) Part I, Introduction: The nature and scope of educational psychology The teacher and the educative process. Part II, Growth and development. Part III, The learner's potentialities Intelligence and its measurement. Aptitude and aptitude testing. Personality traits and their evaluation. Educational implications of individual differences. Part IV, General principles of learning: Attitudes, interests, and motivation. Acquiring motor skills and knowledge. Reflective and creative thinking. Importance of transfer of training. Part V Evaluation of learner achievement Nature and scope of educational evaluation. Simple statistics in education. Part VI, Psychology of learning areas. Acquiring the tools of comprehension and expression. Acquiring mathematical concepts. Developing an understanding of the natural and social sciences. The development of appreciation. Educating for health and safety Vocational exploration and preparation. Part VII, Life adjustments. Adjustment of exceptional individuals. Behavior drives and adjustment. Applying mental hygiene to individual adjustment. Author index. Subject index.

Note An introductory textbook written by two faculty members of the Department of Education of Brooklyn College. It is used for the instruction of students in teachers' colleges. It offers a broad modern view of educational psychology including basic knowledge derived from experimental psychology References to source publications are included as footnotes and lists of "suggested readings" are included at the ends of chapters.

CROW, LESTER D , AND ALICE CROW

Human development and learning New York American Book Company 1956 578 p illus. 23 cm. $5 50 5109

and Company 1951 511 p. illus. 23 cm. $5.50. 5120

Contents: Part I, Basic growth concepts: Origin of the organismic viewpoint. Principles of growth and development. Interrelations of growth—an approach to study of the child as whole. Part II, Aspects of development: The physical growth of the child. Aspects of motor growth. The growth of intelligence. Language development. The development of creative ability. Personal-social development. Growth and the organization of learning. Part III, Concomitants of growth and learning: The role of emotion in child development. The development of moral and ethical behavior. The development of personality. Discipline and the growth process. Mental hygiene from the standpoint of growth. Index.

Note: Preliminary to his direction of child development demonstration center, the author gave 10 years to study and research with 450 children, during which time some 200,000 observations were made and recorded. On the basis of this experience, he presents an introductory over-all picture of the physical and mental development of the elementary school child. The volume, intended for pre-service and in-service teachers, administrators, and others interested in child development, begins with an exploration of the principles of child development, follows with discussion of certain of its phases, and concludes with several chapters on those aspects of child development which are accompaniments of growth rather than measurable and direct phases of it—emotion, moral and ethical behavior, personality, discipline, and mental hygiene from the standpoint of growth. Developmental changes in the child and on the relationship between the child environment and such changes are emphasized.

MILLER, NEAL EDGAR, AND JOHN DOLLARD

Social learning and imitation. New Haven Published for the Institute of Human Relations by Yale University Press 1941 341 p. illus. 23 cm. $3.50. 5121

Contents: Foreword. Figures. Preface. Learning: its conditions and principles. Four fundamentals of learning. Significant details of the learning process. A basis for acquired drives and acquired rewards. Higher mental processes. A pattern case of imitation. The learning and the generalization of imitation—experiments on animals. The learning of imitation—experiments on children. Varying cases of matched-dependent behavior. Copying—the role of sameness and difference. The prestige of models—experiments on children. The social conditions producing imitation. Imitation and independent learning—experiment on children. Crowd behavior. Analysis of lynching. Copying in the diffusion of culture. Appendixes: Reviews of Holt's *Theory of imitation.* Theories bearing on the nature of imitation. Laboratory experimental work on imitation behavior. References. Index.

Note: An attempt to use both psychology and social science in study of imitative behavior. Data are presented concerning concrete examples of this behavior in the lives of small children, and experiments are reported which were made, in most cases, with children. These experiments were conducted to test various implications of the hypothesis that imitative behavior is learned, and that it can therefore be subjected. It is not the intent of the authors that this hypothesis shall be considered to effect on this field, but rather beginning for further study and investigation.

MURPHY LOIS (BARCLAY) AND HENRY LADD

Emotional factors in learning. New York Columbia University Press, 1944 404 p. 22 cm. (Sarah Lawrence College publications. No. 4) $5.00 5122

Contents. Part I, The development of an educational point of view: Preface: Individual education and social change. The role of Cognition in educational guidance. Interests and motivation. Variation of learning attitudes. Scope in orientation and growth. The ways in which development comes. The role of "problems" in learning. Defensiveness with specific types of work. Patterns of personality. Insecurity at the college level. Authority problems in relation to learning. Summary of dynamic factors in learning. Part II, Individual studies. Introduction. Ambitious, unusual talent, and rigid personality. Ambivalence resulting from early shock. A practical limited student. Insight without persistent goals. A shy student. Success without growth. Therapeutic uses of the curriculum. A correction to dogmatic thinking. Index.

Note: This monograph is one of series of reports of work done Sarah Lawrence College under full-year grant from the General Education Board. The study centers upon the educational development, through four years, of the students in two entering classes, using records, case reports, personality-test data, and stenographically recorded interviews with students graduating from the two classes. Part II of the book is concerned with individual studies of specific girls, and, together with the first part, attempts to describe method of approach to concepts of guidance developed out of the authors' experience.

NATIONAL SOCIETY FOR THE STUDY OF EDUCATION

The education of exceptional children. Prepared by the Society's Committee Harry J Baker and others. Edited by Nelson D Henry Chicago The University of Chicago Press, 1950 350 p. illus. 22 cm. (National Society for the Study of Education. Forty ninth yearbook pt. II) $3 50 5123

Contents: Editor preface. Introduction to Yearbook. Section I, General concepts and problems: Basic facts and principles underlying special education, by the Yearbook Committee. Administering the special services for exceptional children, by R. Graham and A. M. Engel. Identifying and diagnosing exceptional children, by H. J. Baker and M. B. Stanton. Growth patterns of exceptional children, by W. C. Olson and B. O. Hughes. Guidance for the exceptional child, by F. H. Finch and V. Yowell. The education of teachers of special classes, by F. E. Lord and S. A. Kirk. Parents' problems with exceptional children, by S. R. Laycock and O. S. Stevenson. Section II, Nature and needs of specific groups: Teaching the visually handicapped, by W. Hathaway and R. Lowenfeld. Teaching the acoustically handicapped by C. D. O'Connor and A. Streng. Teaching children with speech handicaps, by W. Johnson. Teaching the orthopedically handicapped and the cardiopathic, by L. J. Linck and others. Special education for the epileptic, the tubercular and children with glandular disorders, by W. C. Cruickshank and W. G. Peacher. Special education for the mentally handicapped, by E. M. Kelly and H. A. Stevens. Special education for the gifted child, by M. R. Sumption and others. Special schools and classes for the socially maladjusted, by E. H. Stullken. Section III, Some future developments. The prevention of handicaps in children, by C. P. Ingram and M. C. Schumacher. Needed projects and research in special education, by S. A. Kirk. Appendix. Index.

Note: This publication was planned to explain the nature of the problems which the school and the community are confronted in connection with the education of exceptional children and to describe the procedures and special services which have been found effective in meeting the needs of exceptional children within school system. The chapters were written for it by outstanding psychologists and educators, most of whom have had extensive experience in the education of exceptional children. Selected literature references are included in all of the chapters.

NATIONAL SOCIETY FOR THE STUDY OF EDUCATION

Learning and instruction. Prepared by the Yearbook Committee, G Lester Anderson, chairman. Edited by Nelson D Henry Chicago The University of Chicago Press 1950. 352 p 22 cm. (National Society for the Study of Education. Forty ninth yearbook, pt. I) $3.50. 5124

Contents. Editor preface. Introduction. Section I, Basic factors underlying learning. The general nature of learning, by G. L. Anderson and A. I. Gates. Motivation and school learning, by E. R. Hilgard and D. Russell. Section II, How children learn in the school environment: How children learn the motor types of activities, by C. E. Ragsdale. How children learn information, concepts and generalizations, by W. A. Brownell and G. Hendrickson. How children learn personal and social adjustment, by C. Tryon and W. E. Henry. How children learn esthetic responses, by J. L. Mursell. How children learn the principles and techniques of problem-solving, by R. L. Thorndike. Section III, Applying principles of learning to the improvement of instruction at different levels of school work: Implications for organization of instruction and instructional adjustments, by W. H. Burton. Applications of learning principles to the improvement of teaching in the early elementary grades, by E. J Swenson. Implications for improving the instruction in the upper elementary grades, by G. M. Wilson. Implications for improving instruction in the high school, by H. A. Thelen and R. W. Tyler

educational psychology Part II, Foundations of learning: Brightness and dullness. Perception and attention. Emotion and motivation. Physical basis of behavior and learning. Part III, Learning and its measurement Viewpoints on the learning process. How children learn. How teaching guides learning. Psychology of audio-visual learning and teaching. Individual differences. Evaluating learning. Part IV Improving learning habits. Part Psychology of school levels, curricula, and methods. Part VI Social adjustment through learning experiences. Part VII, Personal adjustment through learning experiences: How education affects personality Mental hygiene. Part VIII, Psychological factors in school organization and administration: Psychology of discipline. Psychology of the guidance program. Psychology of extracurricular activities. The improvement of teaching. Selected references. Index.

Note. This introductory book on educational psychology is designed for the use of college students who are preparing for careers in education. The authors have covered not only the standard topics in educational psychology but also certain new areas of the subject, including creative activity and audio-visual learning, the psychological analysis of school levels, of the curriculum, of teaching procedures, and the psychological study of extracurricular activities and school leadership. Each chapter concludes with a group of about 10 brief practical questions and a selected list of about 20 recent books and articles.

HATHAWAY, WINIFRED

Education and health of the partially seeing child. Revised edition New York Published for the National Society for the Prevention of Blindness, Inc., by Columbia University Press, 1947 216 p illus 23 cm. $3 75 5115

Contents (abridged) Part one, Historical background. Part two, Administrative responsibilities Classification of the partially seeing. Method of finding partially seeing children. Administrative program planning. Problems in administrative program planning for small communities and rural areas. School health services for visually handicapped children. Selection and preparation of the teacher of the partially seeing. Supervision of partially seeing pupils. Methods of conducting and financing classes for the partially seeing. Preparing the school for the partially seeing child. Part three, Educational responsibilities: Teaching partially seeing children. The use of mechanical devices in teaching. Child guidance for partially seeing pupils. Part four Community social service responsibilities: Community social service and civic organizations. The road ahead. Appendices What the teacher should know about the eye and eye hygiene. Vision testing, screening process. Equipment for partially seeing pupils. Vocabulary of terms relating to the eye. Bibliography Index.

Note. This work is handbook of procedures, primarily for educational administrators, teachers, and ophthalmologists interested in children ith defective vision. Secondarily it is challenge to the public to make vailable the necessary facilities for specialized educational programs for such children. The broad administrative aspects of the problem are intelligently presented, without sentimentality and the actual details of daily procedure are described clearly and practically although the difficulties of the program are not minimized, especially for the small or rural school system. The revised edition includes some new supplementary and bibliographical material.

HILGARD ERNEST ROPIEQUET, AND DONALD G MARQUIS

Conditioning and learning. New York D Appleton-Century Co , 1940 429 p illus 21 cm. (Century psychology series Richard M Elliott, editor) $4 00 5116

Contents The place of conditioning in psychology Classical conditioning experiments. Instrumental conditioning experiments. The nature of reinforcement. The nature of extinction. Strength of conditioning. Gradients of reinforcement. Generalization and discrimination. Serial learning. Problem solving. Voluntary action. Personality Neurophysiological mechanisms of conditioning. Glossary References and author index. Subject index.

Note. This book represents critical exposition of the facts and theories of conditioning principles. Greatest emphasis has been laid upon the relation of conditioning to learning theory Later chapters survey the possibilities of applying conditioning concepts within some of the other fields. There are 39 figures to supplement the text, and each chapter ends with a summary and notes divided by subject. A 11-page glossary is also added.

HILGARD, ERNEST R

Theories of learning Second edition. New York Appleton Century-Crofts, Inc., 1956. 563 p illus 23 cm. (The Century psychology series Richard M Elliott, editor) $5.50. 5117

Contents. The nature of learning theories. Thorndike's connectionism. Guthrie's contiguous conditioning. Skinner's operant conditioning. Hull's systematic behavior theory Tolman's sign learning. Classical Gestalt theory Lewin's field theory Freud psychodynamics. Functionalism. The emergence of mathematical models. Current developments: I, reinforcement and drive. Some persisting issues. Retrospective prospect. References and author index. Subject index.

Note A critical study of theories of learning which are of current interest. The main points of each theory are discussed at adequate length and are related to experiments which were designed by the author of the theory or by other investigators in order to support or to test its validity The historical antecedents are sketched and references are given to a generous selection of the related literature. The book is of interest to advanced and graduate students of psychology to teachers and to psychologists conducting research in areas of psychology tangential to learning theory The first edition was published in 1948. One chapter covering period was deleted in preparing this second edition, the contents of another were incorporated in other chapters, and four new chapters are written. In addition, most of the chapters carried over are substantially revised. The list of literature references is now 58 pages long, and cites publications as recent as 1955.

LINDGREN, HENRY CLAY

Educational psychology in the classroom. New York John Wiley & Sons, Inc., 1956. 521 p illus. 24 cm $5 00 5118

Contents Introduction to educational psychology Origins of behavior The growth and maturity of the learner The learner and his family The learner in his group. Emotional health and problem behavior. Traditional theories of learning. Psychological concepts of the learning process. Intellectual and non-intellectual factors in the learning process. Teacher-centered approaches to the learning situation. Child-centered approaches to the learning situation. Discipline and the learning situation. Learning through group methods. Evaluation of learning. The meaning and use of standardized tests. Children with special needs. Guidance services—individualized help for the learner. The psychology of being a teacher. Appendixes Acknowledgments. Index.

Note Written for student teachers and designed for first courses in educational psychology this book provides modern and useful view of this field. It is written in readable style and is attractively illustrated. References are made to selection of research studies, but the text is not overburdened ith literature references. The publisher has provided an attractive format.

McGEOCH, JOHN ALEXANDER

The psychology of human learning. Second edition revised by Arthur L. Irion. New York Longmans Green and Company, 1952 596 p illus 22 cm. $5 00 5119

Contents. Concepts and methods. Some theoretical considerations. Conditioned response learning. Intraserial phenomena. The distribution of practice and reinforcement. Learning as function of motive-incentive conditions. The law of effect. The role of frequency Transfer of training. Retention and forgetting. Learning as a function of the material learned and of certain modes of practice and presentation. Individual differences and learning. Concluding statement. Author index. Subject index.

Note. A textbook which is designed primarily for college students who are majoring in educational psychology The treatment is advanced, and the main emphasis is on theory Long bibliographies are included. The author index of cited publications runs to 10 pages. Very substantial changes have been made in the present edition. These include more attention to animal learning and to its correlation with the current knowledge of human learning

MILLARD, CECIL VERNON

Child growth and development in the elementary school years Boston D C. Heath

SORENSON HERBERT

Psychology in education. Second edition. New York McGraw Hill Book Company, Inc., 1948. 535 p. 24 cm. $5.50. 5130

Contents (abridged) Human physical growth and development. Mental growth and development. Social growth and development. Our wants, drives, and urges. Emotions, personality and mental hygiene. Intelligence and its relationship to other qualities. Learning capacity and school success. Adjustment to individual differences in intelligence. The progress of growth and development through learning. Interest, attention, incentives and motivation. Transfer of learning and mental discipline. The activity and project method of teaching. Measuring the learning and achievement of pupils. Appendix: Discussion of some statistical and experimental concepts. Glossary. Author index. Subject index.

Note A well-rounded introductory work. Emphasis is given to such matters as emotional reactions, behavior patterns, and the influence of heredity and environment in shaping the responses of children to teaching. Children are [illegible] as members of society with personalities and apparent abilities which are largely shaped by the [illegible] and influences, but heredity is represented as the determining factor in exceptional degrees of mental ability. The frequent introduction of experimental results and case histories adds interest and credibility to the exposition. The first edition was published in 1940. Two chapters were added in preparing this edition, and much of the original material was rewritten. The extensive bibliographies were revised to include literature published since 1940.

SPENCE, KENNETH W

Behavior theory and conditioning. New Haven Yale University 1956 262 p. illus. 22 cm. (Yale University Mrs. Hepsa Ely Silliman memorial lectures) $4.50. 5131

Contents: Historical and modern conceptions in psychology. Selective learning and conditioning. Acquisition curves of conditioning. Theoretical model based on conditioning curves. The role of reinforcement in instrumental reward conditioning. The role of motivation in conditioning. Some applications of the theoretical model to complex learning. Appendixes. Bibliography. Index.

Note: The author of this significant volume has conducted research on the stimulus-response theory of learning for over 20 years. The book is based in large part on the results of this research, but the pertinent results of others are incorporated also. Although some individual experiments and their individual results are described, the main emphasis is on integration of the results into [illegible] tentative theory. In the seventh chapter the theory is extended from simple conditioning of animals to complex behavior situations. The lectures—which in revised form constitute the chapters of the book—were addressed to an audience that included laymen as advanced students of psychology and graduate scientists. The presentation, therefore, is somewhat less technical than it would be in [illegible] book intended for experimental psychologists alone. Even so, the style is far from strictly popular.

STEPHENS, J M

Educational psychology the study of educational growth. Revised edition. New York Henry Holt and Company 1956 717 p. illus. 24 cm. $6.00. 5132

Contents (abridged) Part I, Psychology and the study of educational growth: Understanding educational development—procedures and pitfalls. Locating and using published research. Part II, Physical and mental growth—the general pattern of forces. Physical growth and the problem of health. Growth in intelligence and in the [illegible] use of symbols. Growth in scholastic achievement. Mental and physical growth—the role of nonscholastic factors. Part III, Physical and mental growth—the teacher enters the pattern of forces. Theories of general behavior. Theories of learning. Meaningful relevance in learning and in problem solving. Reducing interference and confusion. Teaching for permanence and transfer. Part IV, Personal and social growth. Personal and social adjustment—basic needs and processes. Social patterns—individual reactions and group processes. Personal and social adjustment—major forces and [illegible]. Guiding personal and social growth—the problems and the goals. Improvement in adjustment and attitudes—mental hygiene in the classroom. Author index. Subject index.

Note A substantial, modern view of educational psychology is presented in this work. A primary theme [illegible] that the teacher is only one element in [illegible] complex pattern of forces affecting the educational development of individuals, and due attention is given to the other forces. The findings of [illegible] the range of research studies are incorporated, and references are made to the original publications. The first edition [illegible] published in 1951. The chapter on individual practices and group processes was added in this second edition, and most of the chapters were revised and rewritten so as to incorporate the results of additional research. References were added to the bibliographies. The author is [illegible] member of the Johns Hopkins University.

STROUD, JAMES B

Psychology in education. Second edition. New York Longmans, Green and Company 1956 617 p. illus. 22 cm $5.00 5133

Contents: The educative process. Education and social class. Man and nature. Race and culture. Psychology of reading. Language and communication. The nature and measurement of intelligence. Mental and physical growth. Education of exceptional children. Approaches to the psychology of learning. Individual differences. Teacher and pupil. Memory. The impact of experience. Mental hygiene and the school child. The profession of teaching. Author index. Subject index.

Note. An intermediate-level treatment designed as [illegible] text for advanced undergraduate and graduate students of education. It provides [illegible] broad, modern [illegible] of the field with due acknowledgment of the cultural and sociological studies bearing on education. The first edition was published in 1946. It was extensively rewritten, and four chapters were added in preparing this edition. References to research studies published in the decade since the first edition was written were added.

TILTON JOHN WARREN

An educational psychology of learning. New York The Macmillan Company 1951 248 p. illus. 22 cm. $3.75 5134

Contents. Part I, An introduction to learning theory: The general problem. Explanation in terms of elements? Explanation in terms of prior experience? Explanation in terms of effects? Part II, The learning process. A general description of learning. Learning in relation to problem solving. Learning as related to practice. Learning and adjustment. Part III, The individual learner. The measurement of achievement. Measures of ability to learn. Specialization of ability to learn. "Native" ability to learn. Personality. Part IV, Some implications for education. Education and the psychology of learning. For more efficient learning. Index of names. Subject index.

Note. This work is not [illegible] textbook or an encyclopedic reference book of the subject, but is rather an original presentation of the nature of the learning process. The author is acting Chairman of the Department of Education in Yale University.

APPLIED PSYCHOLOGY

BERRIEN FREDERICK KENNETH

Practical psychology Revised edition. New York The Macmillan Company 1952 640 p illus. 22 cm. $6.25 5135

Contents: Part 1. Psychology applied to problems of adjustment: Study efficiency. Principles of mental health. Mental health and guidance. Treatment of maladjustments. Adjustments in later life. Part 2, Psychology applied to industry. Employment psychology. Training in industry and business. Efficiency in production. Morale and rewards for work. Industrial and highway accidents. Part 3, Psychology applied to consumers and advertising: Consumer and advertising research. Advertising. Part 4, Psychology applied to crime. Factors in criminal behavior. Testimony and the courtroom. Detecting deception. Treatment of offenders. Part 5, Psychology applied to personal problems: Vocational guidance. Effective speaking and writing. Appendix: Simple statistics. Name index. Subject index.

Note: A basic text designed for use in introductory college courses. However the inclusive scope and simple style make it useful also to persons out of college who have practical or professional interests in the subject. Literature references are given in the form of footnotes. The first edition appeared in 1944. This edition represents [illegible] substantial revision and enlargement. The author is [illegible] member of the staff of the Institute for Research in Human Relations.

Section IV The psychology of learning and teaching procedures The school as a learning laboratory by G. L. Anderson and others. Index.

Note. A carefully prepared interpretation of learning theory from the viewpoint of its application in teaching. It is addressed to teachers, and its purpose is to aid them in applying what is known about the psychology of learning in their teaching practices. Literature references are included in all of the chapters.

OLSON, WILLARD CLIFFORD

Child development. Boston D C Heath and Company, Inc., 1949 417 p illus 23 cm $4 75 5125

Contents Growth and development. Growth periods and educational programs. The expression and nurture of mental growth. Growth in school achievement. The child as a whole. The human relations of the classroom. The child in the home and community The affective life of the child. The teacher in individual and group relationships. Concepts of child development in curriculum and methods. Concepts of child development in the organization and administration of schools. The philosophy of growth. Appendixes Text books and manuals in child development. Finding, abstracting, and reviewing services. Instructional films. Manual for the behavior journal. Index.

Note This approach to child development is oriented toward school teachers. It is, however a comprehensive approach to the concepts of child development and to a growth point of view concerning the organization and adjustment of behavior A good deal of attention is given to the modern social point of view in education Illustrations and graphs are excellent.

PETERSON, HARVEY ANDREW

Educational psychology, Chapters 12, 16 & 18 by Stanley S Marzolf, with a chapter on mental development in infancy and childhood by Nancy Bayley New York The Macmillan Company 1948 550 p illus 21 cm $5 50 5126

Content The field of educational psychology The social environment of youth. Mental development in infancy and childhood. Mental development in adolescence. The experimental evidence for cooperation in learning. Social learning. Motivation. Case studies in teaching and learning. Individual learning. Learning motor skills. Retention. Mental hygiene. The hygiene of work. The measurement of personality other than intelligence. The measurement of intelligence. The measurement of achievement. Some studies of the modification of heredity by environment. Vocational guidance. Index.

Note An introductory text for student teachers. Common social and educational situations are emphasized rather than purely theoretical principles, and the importance of co-operative learning in groups is stressed. The learning of motor skills is discussed in unusual detail. The book is generously equipped with illustrations, chapter summaries, questions and exercises, lists of supplementary reading, lists of available visual aids, and references to related literature.

REDL, FRITZ AND WILLIAM W WATTENBERG

Mental hygiene in teaching Under the editorship of Willard B Spalding and Ernest R. Hilgard New York Harcourt, Brace and Company 1951 454 p 22 cm. $4 50 5127

Contents Part A, Introduction Food for thought. What it is all about. Part B Some fundamentals Behavior mechanisms. Growth. Influences that shape lives. Some personality distortions. Adjustment, maturity and normality Part C, Classroom applications Mental hygiene and school learning. Group life in the classroom. The psychological roles of teachers. Diagnostic thinking in the classroom. Influence techniques. Some common dilemmas teachers face. Children who need special help. Working with parents. Teachers' problems. Limitations of mental hygiene in education. Part E, Appendices Sources of additional help and information. Meaning of special terms. Index.

Note Well versed in modern dynamic concepts of personality development, the authors of this book have made distinct contribution to teachers who wish to approach children as individuals and to see the adjustment problems of children as real and significant. There is practically none of the technical terminology of clinical psychology. Instead, the book is written in the common language. The cases and situations described are typical of those encountered in public schools. The appendixes contain a guide to periodicals and pamphlets on mental hygiene, to audio-visual aids, and a glossary of technical terms.

SKINNER, CHARLES E , editor

Educational psychology Third edition. Englewood Cliffs, N J Prentice-Hall, Inc., 1951 791 p illus 22 cm $6 75 5128

Contents. Introduction: The nature and scope of educational psychology by C. E. Skinner Part I, Human growth and development: The general nature of growth and development, by T R. McConnell. Emotional development, by A. T Jersild. Social growth and character formation, by F F Powers. Intelligence—its nature, growth, and measurement, by P Witty Individual differences in mental abilities—their nature and causes, by F S. Freeman. From childhood to adolescence, by E. S. Conklin and F S. Freeman. Part II, Learning: The learning process—acquisition and retention, by R. A. Davis. Motivation in school learning, by M. K. Thomson. Development of motor skills and knowledge, by J. D. Lawther. Problem solving, by J. Stanley Gray Creative learning and expression, by J M. Fletcher Interests, attitudes, and ideals, by G. W Hartmann. Learning the fundamental school subjects, by K. C. Garrison. Subject disabilities—special difficulties in school learning, by E. R. Wood. Transfer of learning, by L. W Webb. Basic principles of learning, by J N Washburne and others. Part III, Personality and adjustment Personality—its nature and development, by P L. Boynton. Personality maladjustments and mental hygiene, by R. T Rock, Jr Adjustment of deviating children, by J E. Wallace Wallin. Abnormal children and their treatment—some special behavior problems, by F A. Moss. Part IV Measurement and evaluation Educational measurements, by E. A. Lincoln. Teacher-made examinations and other techniques of evaluation, by W J Gifford. Part V Teaching and guidance. Guidance, by M. R. Trabue. Practical guidance and the teacher by A. W Abel. What is teaching? by L. E. Raths. Subject index. Index of names.

Note. A successful textbook, widely used in introductory courses in teachers' colleges. The various chapters are written by outstanding authorities, most of whom are professors in colleges and universities in the United States of America. No particular school or method is favored; but most of the chapters emphasize concepts and theories which have been verified by experimental evidence. Selected but extensive lists of suggestions for further reading are special feature. The second edition was published in 1945. For this third edition many chapters were rewritten in whole or in part. The arrangement of the book was changed somewhat. A selection of the literature published since 1944 was added to the reference lists.

SKINNER, CHARLES E , editor

Elementary educational psychology Second edition. New York Prentice-Hall Inc., 1950 592 p illus 22 cm $5 75 5129

Content Part I, Introduction The nature of educational psychology by J W Charles. The teacher and his task, by F F Powers Part II, Growth and development Personality and behavior, by P L. Boynton. Growth and development, by P L. Harriman. Stages in human life infancy childhood, adolescence, maturity and senescence, by F F Powers. Part III, Mental abilities and individual differences Intelligence and aptitude their nature, development, and measurement, by P A. Witty Individual differences and school adjustments, by J W Wrightstone. Part IV The learning process and evaluation of learning outcomes General aspects of learning, by F F Powers. The dynamics of learning, by P L. Harriman. Transfer of training, by P L. Boynton. Perceptual motor and associational learning, by J W Wrightstone. Reflective thinking and problem-solving, by P L. Harriman. Creative thinking and learning, by P L. Harriman. Psychology of the school subjects, by J W Wrightstone. Appraising the results of learning, by J. W Wrightstone. Part V Personality adjustment, and guidance: Emotion and adjustment by W C. Ryan. Social adjustment and conduct disorders, by W C. Ryan. Adjustment and guidance of the exceptional child, by W C. Ryan. Mental hygiene, by W C. Ryan. The nature and techniques of guidance, by F F Powers. Index of subjects. Index of names.

Note. An established introductory text for college students who are preparing for careers in teaching. Modern ideas and methods are emphasized. The pattern of the book is the same as in the first edition, but the several authors have brought their chapters and the accompanying reference lists up to the date of the revision.

FRYER, DOUGLAS HENRY, AND EDWIN R. HENRY editors

Handbook of applied psychology Contributors Theodora M Abel and others. New York Rinehart & Company Inc., 1950. 2 v 842 p. illus. 26 cm. $15.00. 5142

Contents (abridged): Part one: Group living. Individual efficiency. The individual adjusting to his environment. Techniques of personnel psychology. Fields of personnel psychology: selection and training. Industrial psychology. Transportation. Business psychology. Part two: Educational psychology—techniques of educational adjustment. Fields of educational psychology. Clinical psychology. Fields of clinical psychology. Penology. Consulting psychology. The professions—contributions of applied psychology. The arts—contributions of applied psychology. Administration of psychological services. The professional psychologist. A selected and classified bibliography in applied psychology. Index of contributors. Subject index.

Note: A work composed of 115 papers especially written for it by outstanding American psychologists. It was prepared under the auspices of the American Association for Applied Psychology. The papers are signed with the names of the contributors. Each one is a concise statement of the aspect of applied psychology named in its title and concludes with a selected bibliography. The main bibliography, although a selected one, also runs to 50 closely printed pages.

GARDNER, BURLEIGH, AND DAVID G MOORE

Human relations in industry Third edition. *Homewood, Ill. Richard D Irwin, Inc.*, 1955 427 p. illus. 23 cm. $7.00 5143

Contents: The dynamics of business. The dynamics of human behavior. Division of labor. Authority system and chain of command. Status and status hierarchies. Systems of communication. The functions and problems of each level. The union—its functions and place in the structure. Unions and their structure. Wages and wage systems. Wage incentives and restriction of output. The technique of organization. The individual in the structure. Minority groups in industry. The problems of change. The industrial relations organization. Personnel counseling. Executive personality and organization. Human relations and management. Study Guide. Index.

Note: A very practical exposition of industrial psychology. It is addressed to management and supervisory personnel in industry rather than to college students; and it covers broadly the human relations aspect of management of workers including such important items as wages and wage systems. However, it is concerned primarily with psychology and is particularly valuable for its down-to-earth discussion of such matters as status hierarchies, adjustments and maladjustments of individual workers, and the problems of minority groups.

GHISELLI, EDWIN E. AND CLARENCE W BROWN

Personnel and industrial psychology Second edition. New York McGraw-Hill Book Company Inc. 1955 492 p. illus. 23 cm. (McGraw Hill series in psychology *Clifford* T Morgan, consulting editor) $6.50. 5144

Contents: The scientific study of human factors in industrial problems. Analysis of jobs. The measurement of job proficiency. Rating methods. Principles and problems in the selection and classification of workers. The interview and personal-data analyses. Characteristics and development of psychological tests. Prediction of occupational success by means of aptitude tests. Nature and characteristics of human work. Conditions of work and productivity. Methods of work and design of equipment. Accidents and the safety problem. Training in industry. Motivation of workers. Social factors in industry. Name index. Subject index.

Note: It includes treatment of the psychological principles fundamental to effective personnel and training policies. It is designed for both university students and interested readers in industry, business, and labor. Because of its many brief subdivisions and simple language, it may be comprehended whether studied in an organized course or in self-instruction. Its general approach is characterized by emphasis on the human factor as an integrated whole, in contrast with the atomistic conception of the worker as a set of mechanical responses to stimuli. A number of examples in the text and references compiled at the end of each chapter contribute to a thorough and systematic presentation, but do not interfere with the readability of the book. The first edition was published in 1948. In this second edition, the scope of the book is essentially unchanged, but revision—not extensive in most instances—has been made in many chapters and literature published since the first edition has been added to the list of references. The original chapter on social factors in industry is a new addition.

GRAY, JOHN STANLEY

Psychology applied to human affairs. Second edition New York McGraw Hill Book Company Inc., *1954* 581 p. illus. 24 cm. (McGraw Hill series in psychology Clifford T Morgan, consulting editor) $6.25 5145

Contents: *Introduction—antecedents of applied psychology.* Psychology in college life. Child development. Educational psychology. Vocational guidance. Personality adjustments. Speech correction. Mental illness, by F. A. Brown. Clinical psychology, by C. A. Whitmer. Psychological effects of diet and drugs. Crime and crime detection, by D. S. Rogers. Psychology in industry—work and efficiency, by A. G. Dietze—employment methods, by S. E. Seashore—training and morale, by S. E. Seashore—wage determination. Psychology in marketing and advertising, by M. A. B. Brazier and W. R. Myles. Military psychology, by G. L. Fahey. Psychology in music and art, by G. Reyburn-Gray. Public opinion and propaganda, by R. Stagner. Appendix. Name index. Subject index.

Note: A standard textbook for college courses in applied psychology. The title notwithstanding, the book is not intended for reading outside of organized courses conducted under competent instructors. Practical aspects of psychology are emphasized, and each chapter is in effect a compact, interpretative summary with references to original sources of selected papers and reports that bear on its specific topic. One of the authors' aims was to include facts about the applications of psychology in a variety of fields. The first edition was published in 1946. In preparing the second edition, the order of chapters was rearranged, the former chapter on the psychological effects of narcotics and drugs was replaced by a new one, and revisions were made in a number of chapters. The chapters listed in the above contents without authors' names were written by Professor Gray; the other chapters were contributed by the psychologists whose names are given. Both references to support statements in the text and lists of supplementary reading are included.

GRAY JOHN STANLEY

Psychology in industry New York McGraw Hill Book Company Inc., 1952 401 p. illus. 24 cm. (McGraw Hill publications in psychology Clifford T Morgan consulting *editor*) $6.00. 5146

Contents: Introduction—Basic concepts in human engineering. Work analysis. Worker analysis. Job training. Methods of work. Wages and merit rating. Wages and job evaluation. Nutrition and rest. Safety. Monotony and boredom. Lighting and ventilation. Age of workers, by K. Garrison. The worker's morale, by K. Garrison. Employee adjustment, by K. Garrison. Appendix. Name index. Subject index.

Note: The inclusion of a chapter on nutrition and rest is indicative of the scope of this practical book. The author states, any factor which affects the production efforts of workmen is appropriately classified as industrial psychology. The level of treatment is introductory but the reader needs a basic knowledge of psychology and also some acquaintance with industry. Although organized so that it may be used as a college text, the book is equally suitable as a practical introduction to the field for men already employed in personnel work and time study in industry. Literature on which statements in the text are based is cited in footnotes.

GRAY JOHN STANLEY editor

Psychology in use a textbook in applied psychology Second edition. New York American Book Company 1951 550 p. 23 cm. (American psychology series Henry E. Garrett, general editor) $5.00. 5147

BLUM, MILTON L., AND BENJAMIN BALINSKY

Counseling and psychology, vocational psychology and its relation to educational and personal counseling New York Prentice-Hall, Inc., 1951 586 p illus. 22 cm. $5 75 5136

Contents: Introduction. Pseudo-scientific guidance. Types of counseling centers. The counseling interview-general. The counseling interview-specific. Principles of vocational testing. Types of vocational tests. The guidance use of intelligence, aptitude, and achievement tests. The guidance use of interest and personality tests. Clinical psychology in relation to vocational counseling. Integrating tests and counseling interviews. Statistics in test interpretation. The concept of interest in relation to counseling. Occupational information. The relation of occupational information to vocational psychology The counselor Evaluation of guidance. Employee counseling. Relation of vocational guidance to vocational selection. Index of names. Index of subjects.

Note The contributions of psychology to the body of knowledge known as vocational counseling is covered in this book. It is used not only as college textbook but also as home reading for non-psychologists, such as teachers and social workers who are interested in and perform counseling duties. Selective bibliographies appear at the ends of the chapters.

BLUM MILTON L

Industrial psychology and its social foundations Revised edition. New York Harper & Brothers 1956 612 p illus. 24 cm (Under the editorship of Gardner Murphy) $6 00 5137

Content Part I, Prelude Introduction. The Hawthorne studies. Part II, Understanding the employee Motivation and work. Measuring attitudes. Job satisfaction. Industrial morale. Unemployment. Part III, Understanding the employer Leadership. Industrial warfare. Part IV Problems related to work Psychological testing in industry Psychological testing programs used in industry Job analysis and evaluation Work environment. Fatigue and other phenomena. Time and motion studies and human engineering. Training and learning. Accidents. Part V Product distribution: Consumer research. Advertising. Selling. Part VI, Summary and integration Overview Test appendix. Index of companies, institutions, and government departments. Index of names. Index of subjects.

Note Primarily college textbook in which is presented an introductory but inclusive survey of applied psychology in the field of labor-management relations, and some other applied fields such as consumer research, in democratic society The presentation is without bias toward labor or management. The 'Hawthorne studies' conducted from 1927 to 1939 at the Hawthorne Works of the Western Electric Company are described, and full use has been made of their implications. However much material has been drawn also from the programs and experiences of other companies. The first edition was published in 1949 In this edition the book has been reorganized, increased in length by approximately 100 pages, and revised and extended in various sections. A selection of the recent literature has been added to the bibliographies. The author is member of the faculty of the Baruch School of Business of City College of New York.

BURTT, HAROLD ERNEST

Applied psychology New York Prentice Hall Inc 1948 821 p illus 23 cm. 5138

Contents (abridged) Some psychological fundamentals. Educational significance of differences in intelligence. Personal efficiency Vocational guidance. Psychology in general medical practice. Nature and diagnosis of mental disorders. Psychotherapy Psychology of testimony Psychological techniques for crime detection. Psychological factors in crime. Psychological tests in employment. Efficiency in industrial work. Fatigue, monotony and accidents. Morale. Methodology and selecting of advertising appeals. Advertising media. Outlying fields. Appendix. Index.

Note The principles and some of the techniques of applied psychology are surveyed in this book, which is addressed primarily to college students of psychology and secondarily to laymen, such as business men, who desire more than superficial popularization. There are no exercises or problems, and no bibliography other than occasional footnotes. The author is Chairman of the Department of Psychology at Ohio State University A second edition was published in 1957 593 p., $6.95.

CHAPANIS, ALPHONSE, AND OTHERS

Applied experimental psychology, human factors in engineering design. By Alphonse Chapanis, Wendell R. Garner and Clifford T Morgan New York John Wiley & Sons, Inc., 1949 434 p illus. 24 cm. (Wiley publications in psychology, Herbert S Langfeld, advisory editor) $6 50 5139

Contents. Introduction. A little statistics. The use of statistics. How we see. Instrument dials and legibility Visual displays. How we hear Speech. Tonal signalling systems. How make movements. Controls for human use. The arrangement of work. Working and resting. The working environment. Index of names. Subject index.

Note: Here is an invaluable work for engineers who design machinery plan production operations, or are concerned with safety programs. Because considerable part of it is derived from investigations and experiments in the control of airplanes, it is of special interest to aeronautical engineers. Another considerable portion of it has direct application to personnel management in factories. A wide range of results of psychological investigations into such matters as the best design for dials, the legibility of type and symbols, the relations between the length of work periods and fatigue have been organized and interpreted. Source articles are carefully cited. Although technical terminology is by no means avoided, the book is outstanding for its readability

CURRENT TRENDS IN INDUSTRIAL PSYCHOLOGY

By Wayne Dennis and others. Pittsburgh University of Pittsburgh Press, 1949 198 p. 22 cm. (Current trends in psychology series University of Pittsburgh Press) $4 00 5140

Contents. The background of industrial psychology by W Dennis. Organization structure, by C. L. Shartle. Job requirements, by J. C. Flanagan. Personal selection, by O. L. Crissy Training in industry by W McGehee. Employee-management relations, by R. Baxter Morale and motivation in industry by D. Katz. Industrial psychology and the community by H. C. Taylor

Note. A collection of papers presented at symposium held at the University of Pittsburgh in February 1949. As indicated by the title, the general topic for discussion is the part which psychology and psychologists are playing and should play in the industrial field.

FREEMAN, FRANK S

Theory and practice of psychological testing Revised edition. New York Henry Holt and Company Inc., 1955 609 p. illus 22 cm 5141
$6 00

Contents. Basic theoretical principles. Interpretation of test scores—quantitative and qualitative. Definitions and analyses of intelligence The Binet scales. Early revisions of the Binet-Simon scale. The 1937 revision of the Stanford-Binet scale. The Wechsler scales. Individual performance scales. Scales for infants and preschool children. Nonverbal group scales of mental ability Verbal and mixed group scales of mental ability Aptitude tests—mechanical and clerical—fine arts and professions. Tests of educational achievement. Intelligence tests as clinical instruments. Tests of mental impairment. Personality rating scales. Personality inventories. Projective methods—the Rorschach and the thematic apperception tests. Projective methods—various. Situational tests. Index.

Note Primarily descriptive treatment of the various kinds of tests currently used for assessing the intelligence, personality aptitudes, and educational achievements of individuals. It is used as text by students of psychology social workers, personnel officers and others employing psychological tests. The purpose, method of application, and interpretation of each test are the main topics, but material is also included on the principles and theories upon which the tests are based. The first edition was published in 1950 In preparing this revised edition, the former chapters on statistics in psychological testing and on applications of problems were deleted. Nevertheless, the length of the book has been extended by almost 100 pages, due to the inclusion of additional material The chapters carried over were well revised, and in many instances considerably augmented. The author is member of the faculty of Cornell University

[illegible] of the situation. Propaganda analysis. Propaganda intelligence. [illegible] of the situation. Part III, Planning and operations. [illegible] Operations for psychological warfare. Plans and planning. [illegible] against civilians. Operations against troops. Part IV Psychological warfare after World War [illegible] The "cold war" and [illegible] [illegible] international information operations. Research, [illegible] and the future. Appendix. Military psywar operations, [illegible] Index.

Note: An expert study of propaganda and other psychological [illegible] which can be employed to influence enemy morale and [illegible] enemy resistance. Theoretical principles [illegible] the [illegible] type of warfare are discussed, but the emphasis is on practical [illegible] Leaflets and other forms of propaganda used by both [illegible] in World War [illegible] and in other [illegible] are illustrated and [illegible] analyzed. Techniques of distribution are described. In [illegible] second edition, pages 1–241 are identical [illegible] with the first edition, but the material on pages 241–[illegible], replacing all of Part IV [illegible] listed in the above contents, is newly added.

MAIER, NORMAN RAYMOND FREDERICK

Principles of human relations applications to management. New York John Wiley & Sons, Inc., 1952 474 p. illus. 24 cm. $7.00. 5154

Contents: Introduction. A human relations training program. Discussion methods. Role playing. Role playing in large groups. [illegible] Group-decision procedure. [illegible] in human relations training. [illegible] The quality of group decision [illegible] Transcriptions of two cases [illegible] by the discussion leader. [illegible] The supervisor [illegible] dealings with individuals [illegible] conferences. [illegible] Bibliography. Index.

Note: Although this is essentially [illegible] book on the application of psychology to common management problems in industry [illegible] principles are subordinate to descriptions and analyses of [illegible] techniques. The main theme of the book is the importance of the principle of participation on the part of both management and employees in arriving at decisions that affect personnel [illegible] Discussion procedures in which employees [illegible] participate are described in detail, and are [illegible] with full [illegible] of actual cases. There are [illegible] pages of case studies and [illegible] of pages of transcriptions of interviews and conferences. The [illegible] techniques suggested have been tested in industry by the author, who is Professor of Psychology in the University of Michigan.

MAIER, NORMAN RAYMOND FREDERICK

Psychology in industry: a psychological approach to industrial problems. Second edition. Boston Houghton Mifflin Company 1955 678 p. illus. 22 cm. $6.00 5155

Contents: The place of psychology in industry. [illegible] factor in behavior. The psychology of attitudes. Frustration as [illegible] factor in behavior. [illegible] Morale. Supervisory leadership. Individual differences. [illegible] The use of psychological tests in industry. The [illegible] of psychological tests. Motion and time analysis. [illegible] Basic principles of motivation. Motivation and [illegible] Fatigue. Psychological fatigue and related phenomena. Safety [illegible] The working environment. Psychological factors in labor turnover. [illegible] and interviewing. Bibliography. Index of names. Index of subjects.

Note: An introduction to the theories and principles of psychology as applied to human problems in industry. It is essentially [illegible] and up to date. Much space [illegible] devoted to the [illegible] psychology of human attitudes, feelings and needs, and there is less than the usual emphasis on the use of psychology in such industrial [illegible] as employee selection. The book [illegible] addressed to college students, both those who are majoring in industrial psychology and those who are preparing for careers in business administration and in administrators engaged in activities that require an understanding of industrial psychology. The first edition was published 1946. This second edition represents an extensive revision and substantial enlargement of the book. There are two additional chapters. The bibliography, which now includes [illegible] selection of the [illegible] published since the first edition was written, is 30 pages [illegible]

NATIONAL RESEARCH COUNCIL. COMMITTEE ON UNDERSEA WARFARE. PANEL ON PSYCHOLOGY AND PHYSIOLOGY

A survey report on human factors in undersea warfare. Washington, D C. The National Research Council Committee on Undersea Warfare 1949 541 p. illus. 26 cm. $2.25 5156

Contents: Part I, General visual problems. How we see—a summary of basic principles, by A. Chapanis. The night lookout, by C. H. Wedell and L. A. Riggs. The design and use of optical instruments, by L. A. Riggs. Printed materials, maps, and charts, by M. N. Cook. The design and use of instruments, by W. E. Kappauf. Visual display [illegible] Visibility on radar scopes, by [illegible] Williams. Visual display of complex information, by J. W. Gebhard. Part II, Design and arrangement of operating equipment. The design of controls, by D. R. Craig and D. G. Ellson. Human factors in panel design, by [illegible] Arrangement of equipment, by R. C. Channell and [illegible] Part III, Auditory problems. Auditory signals, by W. R. [illegible] Auditory discrimination in sonar operation, by W. D. Neff [illegible] and W. R. Thurlow. Part IV Communication. Voice communication—personnel and phraseology by M. H. Abrams. Voice communication—effects of masking and distortion, by G. A. Miller. Visual communication, by W. S. Verplanck. Part [illegible] Habitability: A. Physiological factors. Temperature and humidity in relation to the thermal interchange between the human body and the environment, by L. P. Herrington and J. D. Hardy with [illegible] foreword on the habitability of submarines—a review of the physiological problems, by E. F. DuBois. Diet, by J. Brozek and O. Mickelsen. The sleep-wakefulness cycle of submarine personnel, by N. Kleitman. Part VI, Habitability. B. Psychological factors: Relation of noise to the habitability of submarines, by P. K. Brown. Lighting and color, by M. A. Tinker. Motion sickness—its psychophysiological aspects, by J. E. Brown. Motion sickness—physical considerations regarding its etiology by M. F. Morton. Part VII, Emotional stability and adjustment. Psychophysiology of stress, by C. W. Darrow and C. E. Henry. Psychological causes and results of stress, by R. L. French. Part VIII, [illegible] Morale and leadership, by R. L. French. Part VIII, Selection and training. Selection and training, by L. J. Cronbach. Part IX, Personnel resources. Personnel resources for research in applied experimental psychology by J. L. Kennedy and R. C. [illegible] Name Index. Subject Index.

Note: A collection of original papers written by specialists in response to [illegible] request to provide [illegible] concise, but comprehensive account of the present status of basic and applied research and needed [illegible] formulate recommendations for future research. The papers are accompanied by bibliographies. Three of the papers listed in the above table of contents are not included in the volume itself but are available only from the Chief of Naval Research of the Navy and are loaned only to persons authorized to receive classified [illegible]

POFFENBERGER, ALBERT THEODOR

Principles of applied psychology. New York D. Appleton-Century Company Inc. 1942 655 p. illus. 24 cm. (The Century psychology series R. M. Elliott, editor) $5.00. 5157

Contents (abridged): The field of applied psychology. Learning and the acquisition of skill. Thinking and suggestion. Work and rest. Monotony—a problem in adjustment. The influence of drugs and stimulants. Principles of vocational adjustment. Rating human qualities. The role of intelligence in adjustment. Adjustment to uniformity and variety of work—specialization—standardization. Psychological problems in the distribution of goods. The adjustment of advertising and selling methods to the consumer. The causes of criminal behavior. The determination of guilt. Treatment of the offender. Psychology in the treatment of disease. Psychology in education. Bibliography. Index.

Note: A broad survey of the subject, designed for undergraduate college students who have had an elementary course in the subject. The book is also of interest to vocational teachers, business men, and others [illegible] have some knowledge of psychology. This title is successor to H. L. Hollingworth and A. T. Poffenberger, *Applied psychology*, new edition, New York, 1923. This edition contains nine new chapters, [illegible] include chapters on the psychology of the judge and jury [illegible] advertising, and on vocational subjects. The text is keyed to the bibliography [illegible] includes 722 numbered entries.

ROE ANNE

The psychology of occupations. New York John Wiley & Sons Inc., 1956. 340 p illus. 23 cm. $6 75 5158

Contents: Part I, The roles of occupations: Occupations in three societies. The role of the occupation in the life of the individual. Part II, People differ: Variability. Physical differences. Psycho-

Contents Principles of psychology available for use, by K. C. Garrison and M. Zeigler. Psychology in determining vocational aptitudes, by K. C. Garrison. Psychology in home life, by A. S. Jensen. Psychology in education, by J B Stroud. Psychology in industry by E. E. Ghiselli. Psychology in business, by H. W Hepner. Psychology in law and in criminology by C. A. Whitmer and G. I. Giardini. Psychology in arfare, by T W Harrell. Psychology in clinical practice, by C. R. Rogers and M L Stein. Psychology in medicine, by T Hunt. The psychology of influencing other people, by R. Stagner. Psychology in social reform, by G. W Hartmann. Author index. Subject index.

Note. A college textbook which affords view of the main fields of applied psychology The authors of the various chapters are prominent contemporary psychologists. Generally speaking, each author outlines applications of psychology in his field, describes particular examples, and refers to related professional literature. In comparison to the first edition published in 1941 revisions appear in most of the chapters, but few of the changes are drastic. The chapter on psychology in warfare is a new addition.

HAHN, MILTON E , AND MALCOLM S MAC-LEAN

Counseling psychology Second edition New York McGraw Hill Book Company, Inc., 1955 302 p illus. 24 cm. $4 75 5148

Contents Counselors and counseling. The philosophy and ethics of counseling psychology The nature of educational-vocational-personal problems. The tools and techniques of counseling. Aptitudes, abilities, skills, and achievements. Educational-vocational interests. Collection of data for a systematic case study A counseling interview—some implications. Learning, anxiety reduction, and counseling. Prognosis and prediction. Counseling psychology and related disciplines. Author index. Subject index.

Note. The first edition of this book, published in 1950, was entitled *General clinical counseling in educational institutions.* The second edition, completely revised, has been given new title, to reflect more precisely the nature of the contents. It deals fully with late and significant developments as well as covering the earlier history of the emergence of counseling psychology from the general psychological field and of administratively operated guidance. Included in the preface to the new edition is a brief review of the literature of the field of counseling psychology between the years 1950 and 1955 In addition, each chapter except the last closes with bibliography The authors are ...sors at the University of California, Los Angeles.

HAIRE, MASON

Psychology in management. New York McGraw Hill Book Company, Inc., 1956 212 p 23 cm. (McGraw Hill series in psychology Clifford T Morgan, consulting editor) $4 75 5149

Contents. Introduction. The nature of people. Leadership and supervision. Communication. Training. Productivity and wage-payment plans. More complex problems. Index.

Note. A lucid discussion of some of the high points of applied psychology which are important in the management of enterprises. It is designed for rapid reading and it contains no literature references, chapter summaries, or other customary paraphernalia of text. Nevertheless, it is reliable book and contains information of importance for the intended readers. The author is a specialist in industrial psychology associated with the Institute of Industrial Relations at the University of California.

HARRELL, THOMAS WILLARD

Industrial psychology New York Rinehart & Company Inc., 1950 462 p 23 cm. $5 00 5150

Contents (abridged) Occupational information. Individual differences. Individual differences and their evaluation. Selection by interview and application blank. Personnel tests. Human engineering. Improving work methods. Training. Fatigue and conditions of work. Accident prevention. Human relations Motivation. Attitudes and job satisfaction. Mental hygiene and personnel counseling. Psychological aspects of labor relations. Supervision...Name index. Subject index.

Note. An introductory but substantial ... the contribution that psychology can make in industry ... the problem labor management cooperation and to de... ques which wi... facilitate such cooperation. The author firmly believes that psychology has an important place in developing scientific methods for the study of human behavior in industry However he does not disguise the fact that industrial psychology is not yet fully developed science with universally accepted principles and methods. Many case studies are used to illustrate methods and indicate results. Extensive bibliographies follow the several chapters. The author is Professor of Psychology in Stanford University

JANIS, IRVING L

Air war and emotional stress, psychological studies of bombing and civilian defense. New York McGraw Hill Book Company, Inc., 1951 280 p 24 cm. $7 50 5151

Contents Part I, Reactions at Hiroshima and Nagasaki Introduction. Emotional impact of the A-bomb. Aftermath of the atomic disasters. Part II, Effects of air war Scope of the inquiry Psychiatric disorders. Fear and emotional adaptation. Aggression and wartime morale. Adjustment mechanisms. Part III, Psychological aspects of civilian defense General assumptions. Problems of disaster control. Training and emotional inoculation. Education for survival. Apprehensiveness among the urban population. Bibliography Index.

Note. An important work based on the literature and on research carried out by the Rand Corporation for the United States Air Force. The results of the research were first presented in reports for specialists. These reports served as the primary basis for the book which, however is directed primarily to nonmilitary personnel, including psychologists, and civilian officials concerned with national defense and the protection of civilian populations. Much of the book is based on World War II experience. However the third part looks to the future and particularly to the training of civilian populations in ways that should reduce civilian casualties in case of another major war Pertinent literature is cited in footnotes, and in the seven-page bibliography at the end of the volume.

LAIRD, DONALD A., AND ELEANOR C LAIRD

Practical business psychology Second edition. New York Gregg Publishing Division, McGraw Hill Book Company, 1956 472 p. illus 23 cm. $5 95 5152

Contents (abridged) Part I, Personal efficiency Psychology in business efficiency What is "a fair day's work"? Efficiency and ability to concentrate. Speedier reading, vocabulary building, and use of the eyes. Efficient learning and vocational training. Ways to plan and organize work for greater efficiency Matching jobs and people. Part II, Human relations and morale. Human relations in ... and business. The rise of modern human relations. Motivation ... Creating confident hopefulness. ... morale and the will to work. Personality for business. ... Personality and emotional health Personality for business ... conduct personality interview Part IV Personal leadership ... group cooperation. The nature and basis of leadership. ... The strategies of leadership ...ment of personal leadership. Group cooperation in business. Index.

Note. ... survey of business ... rating the first edition of this book, as made by the authors ... tors and industrial training directors ... and how the contents ... determine what the book should contain and how the ... psychology of ... be presented. The result is that the applied psychology of ... research methodical business is emphasized, while the laboratory ... written partly ... of psychology are treated briefly The book is ... terminology of the terminology of business, but the elementary ... chology is used also. It is addressed to personnel workers, foremen ... an interest in ... In fact, to practically anyone who has ... relations and ... standing the elementary psychology of business ... industrial counsel... It is used as textbook in college and ... second edition ... The first edition as published in 1951. The ... training directors ... on new survey of educators and industrial ... sections in chapters contains three new chapters and many new ... ment of the material ...ried over Also there has been some rearrange-

LINEBARGER, PAUL M A.

Psychological warfare Second edition. Washington D C Combat Forces Press, 1954 318 p illus 24 cm $6 00 5153

Contents. P... Definition and history Historic examples of psychological ... The function of psychological warfare. ... ation of ... warfare. The limitations of psychological ... warfare in World War I. Psychological ... Part II, Analysis, intelligence, and esti-

ment of the situation. Propaganda analysis. Propaganda intelligence. Estimate of the situation. Part III, Planning and operations. Organization for psychological warfare. Plans and planning. Operations for civilians. Operations against troops. Part IV, Psychological warfare after World War II. The "cold war" and [illegible] and [illegible]. Strategic international information operations. Research, development and the future. Appendix: Military psywar operations, 1950-[illegible]. Index.

Note. An expert study of propaganda and other psychological techniques which can be employed to influence enemy morale and sway enemy audiences. Theoretical principles which underlie the type of warfare are discussed, but the emphasis is on practical applications. Leaflets and other forms of propaganda used by both sides in World War [illegible] and in other wars are illustrated and critically analyzed. Techniques of distribution are described. In the second edition, pages 1-241 are identical with the first edition, but the material on pages 243-[illegible], embracing all of Part IV as listed in the above contents, is newly added.

MAIER, NORMAN RAYMOND FREDERICK

Principles of human relations: applications to management. New York: John Wiley & Sons, Inc., 1952. 474 p. illus. 24 cm. $7.00 5154

Contents: Introduction. A human relations training program. Discussion methods. Role playing. Role playing in large groups. Reactions to human relations training. Group-decision procedure. Democratic supervision in action—case studies. The quality of group decisions as influenced by the discussion leader. Transcriptions of two problem-solving conferences. The supervisors' dealings with [illegible]. [illegible]. Bibliography. Index.

Note. Although this is essentially a book on the application of psychology to common management problems in industry, psychological principles are subordinate to descriptions and analyses of practical techniques. The main theme of the book is the importance of the principle of participation on the part of both management and employees in arriving at decisions that affect personnel relations. Discussion procedures in which employees with grievances participate are described in detail, and are pointed up with full accounts of actual cases. There are 30 pages of case studies and some [illegible] pages of transcriptions of interviews and conferences. The new techniques suggested have been tested in industry by the author, who is Professor of Psychology in the University of Michigan.

MAIER, NORMAN RAYMOND FREDERICK

Psychology in industry: a psychological approach to industrial problems. Second edition. Boston: Houghton Mifflin Company, 1955. 678 p. illus. 22 cm. $6.00. 5155

Contents: The place of psychology in industry. Causation in behavior. The psychology of attitudes. Frustration as a factor in behavior. Morale. Supervisory leadership. Individual differences. Measuring proficiency. The use of psychological tests in industry. The general nature of psychological tests. Motion and time analysis. Industrial training. Basic principles in motivation. Motivation and work. Fatigue. Psychological factors and related phenomena. Safety. The working environment. Psychological factors in labor turnover. Counseling and interviewing. Bibliography. Index of names. Index of subjects.

Note. An introduction to the theories and principles of psychology as applied to human problems in industry. It is eminently practical and up to date. Much space is devoted to the basic psychology of human attitudes, feelings and needs, and there is less than the usual emphasis on the use of psychology in such industrial operations as employee selection. The book is addressed to college students, both those who are majoring in industrial psychology and those who are preparing for careers in business administration, and to administrators engaged in activities that require an understanding of industrial psychology. The first edition was published in 1946. This second edition represents an extensive revision and substantial enlargement of the book. There are two additional chapters. The bibliography, which now includes a selection of the literature published since the first edition was written, is 30 pages long.

NATIONAL RESEARCH COUNCIL. COMMITTEE ON UNDERSEA WARFARE. PANEL ON PSYCHOLOGY AND PHYSIOLOGY

A survey report on human factors in undersea warfare. Washington, D. C.: The National Research Council Committee on Undersea Warfare, 1949. 541 p. illus. 26 cm. $2.25 5156

Contents. Part I, General visual problems: How we see—a summary of basic principles, by A. Chapanis. The night lookout, by C. M. Wedell and L. A. Riggs. The design and use of optical instruments, by L. A. Riggs. Printed materials, maps, and charts, by M. N. Crook. The design and use of instruments, by W. E. Kappauf. Visibility on radar scopes, by S. B. Williams. Visual display of complex information, by J. W. Gebhard. Part II, Design and arrangement of operating equipment: The design of controls, by D. E. Craig and D. G. Ellson. Human factors in panel design, by E. [illegible]. Arrangement of equipment, by R. C. Channell and others. Part III, Auditory problems: Auditory signals, by W. R. Garner. Auditory discrimination in sonar operation, by W. D. Neff and W. R. Thurlow. Part IV, Communication: Voice communication—personnel and phraseology, by M. H. Abrams. Voice communication—effects of masking and distortion, by G. A. Miller. Visual communication, by W. S. Verplanck. Part V, Habitability: A. Physiological factors. Temperature and humidity in relation to the thermal interchange between the human body and the environment, by L. P. Herrington and J. D. Hardy, with a foreword on the habitability of submarines—a review of the physiological problems, by E. F. DuBois. Diet, by J. Brozek and O. Mickelsen. The sleep-wakefulness cycle of submarine personnel, by N. Kleitman. Part VI, Habitability: B. Psychological factors. Relation of noise to the habitability of submarines, by F. K. Berrien. Lighting and color, by M. A. Tinker. Motion sickness—its psychophysiological aspects, by J. E. [illegible]. Motion sickness—physical considerations regarding its etiology, by M. F. [illegible]. Part VII, Emotional stability and adjustment: Psychophysiology of stress, by C. W. Darrow and C. E. Henry. Psychological causes and results of stress, by E. A. Haggard. Morale and leadership, by R. L. French. Part VIII, Selection and training: Selection and training, by L. J. Cronbach. Part IX, Personnel resources: Personnel resources for research in applied experimental psychology, by J. L. Kennedy and R. C. [illegible]. Name index. Subject index.

Note. A collection of original papers written by specialists in response to a request to provide "first, a concise, but comprehensive, account of the present status of basic and applied research and second, to formulate recommendations for future research." The papers are accompanied by bibliographies. Three of the papers listed in the above table of contents are not included in the volume itself but are available only from the Chief of Naval Research of the Navy and are loaned only to persons authorized to receive classified documents.

POFFENBERGER, ALBERT THEODOR

Principles of applied psychology. New York: D. Appleton-Century Company, Inc., 1942. 655 p. illus. 24 cm. (The Century psychology series, R. M. Elliott, editor) $5.00. 5157

Contents (abridged): The field of applied psychology. Learning and the acquisition of skill. Thinking and suggestion. Work and rest. Monotony—a problem in adjustment. The influence of drugs and stimulants. Principles of vocational adjustment. Rating human qualities. The role of intelligence in adjustment. Adjustment to uniformity and variety of work—specialization—standardization. Psychological problems in the distribution of goods. The adjustment of advertising and selling methods to the consumer. The causes of criminal behavior. The determination of guilt. Treatment of the offender. Psychology in the treatment of disease. Psychology in education. Bibliography. Index.

Note. A broad survey of the subject, designed for undergraduate college students who have had an elementary course in the subject. The book is also of interest to vocational teachers, business men, and others who have some knowledge of psychology. This title is successor to H. L. Hollingworth and A. T. Poffenberger, *Applied psychology, new edition*, New York, 1923. This edition contains nine new chapters, which include chapters on the psychology of the judge and jury, radio advertising, and on vocational subjects. The text is keyed to the bibliography, which includes 732 numbered entries.

ROE, ANNE

The psychology of occupations. New York: John Wiley & Sons, Inc., 1956. 340 p. illus. 23 cm. $6.75 5158

Contents: Part I, The roles of occupations: Occupations in three societies. The role of the occupation in the life of the individual. Part II, People differ: Variability. Physical differences. Psycho-

logical differences. Differences in social inheritance—in education and other biographical factors. Part III, Occupations differ The structure of occupations in the United States. The classification of occupations. Group I occupations—service. Group II occupations—business contact. Group III occupations—organization. Group IV occupations—technology Group V occupations—outdoor Group VI occupations—the sciences. Group VII occupations—general cultural. Group VIII occupations—arts and entertainment. Part IV Following an occupation Studies of occupational choice. Progress in the occupation. The effect of the occupation on other aspects of living. Part V Implications: The implications of occupational psychology Glossary Index.

Note. A comprehensive and important work on the psychological aspects of choice of occupation and adjustment to occupation, addressed to advanced college students and to college graduates practicing in such fields as counseling and vocational guidance. It presents occupational adjustment as an aspect of social adjustment. It incorporates the results of numerous research studies and provides literature references to the original publications.

ROETHLISBERGER, F J

Management and morale Cambridge, Mass. Harvard University Press, 1956 194 p 22 cm. $3 50 5159

Contents. Part I Introduction. The road back to sanity Understanding—a prerequisite of leadership. The social structure of industry A disinterested observer looks at industry Of words and men. What is adequate personnel management? Part II Concerning people who deal with cooperative phenomena. Concerning people who theorize about cooperative phenomena. Management and morale.

Note. A collection of addresses based in part on the famous Hawthorne study of the factors that influence worker morale and efficiency It is considered to be one of the basic books on the relations between executive and workers in modern industry Essentially it deals with the psychology of such relations, but since the addresses were originally made to groups of businessmen, there is little in them of the jargon of psychology

STAGNER, ROSS

Psychology of industrial conflict. New York John Wiley & Sons, Inc., 1956 550 p illus 24 cm. $8 00 5160

Contents Introduction. Perception—general considerations—applied aspects. Motivation—principles—some applications. Frustration and aggression. Groups and group behavior. Leadership. Institutions. Tactics—management—the union. The accommodation process. The strike. Cooperation. Industrial peace. Bibliography Index of authors. Index of subjects.

Note. In this substantial book, conflicts between management and labor are analyzed in terms of the human motives that underlie them. Writing as a specialist in applied psychology particularly in the field of labor relations, the author first analyzes the motives, then critically examines the traditional tactics of management and labor He is not partial to either management or labor and he does not attempt to write out formulas for management-labor peace. The book is written at a fairly technical level, and is directed to such readers as advanced college students majoring in industrial psychology business management or labor relations, and graduate social scientists who are interested in industrial conflict. It is potentially of value also to top personnel in employing firms and labor unions, who are concerned with management-labor negotiations.

THORNDIKE, ROBERT LADD

Personnel selection, test and measurement techniques. New York John Wiley & Sons Inc., 1949 358 p 22 cm $5 50 5161

Contents: Introduction. Job analysis. Test selection and invention. The estimation of reliability The estimation of test validity—criteria of proficiency The estimation of test validity—statistics of validity Combining tests into a battery The analysis and selection of test items. The administration of a testing program. Administrative problems in using the results of an aptitude testing program. The personnel selection program and the public. Appendixes. Index.

Note Considerable original work is embodied in this book. The chief basis for it was four years of study and organization of a program for the selection of crews for air craft of the United States Army Air Force during World War II. However the approach has been generalized and adapted to make the findings and methods applicable in personnel selection programs in civilian enterprises. Statistical techniques play a considerable part in the methods described, therefore, the reader needs an understanding of basic statistical principles.

TIFFIN, JOSEPH

Industrial psychology Third edition. Englewood Cliffs, N J Prentice-Hall, Inc., 1952 559 p illus 21 cm $6 50 5162

Contents Introduction. The significance of individual differences in industry The interview and related employment methods. General principles of employee testing. Mental ability and mechanical aptitude tests. Dexterity manipulative, and achievement tests. Tests of personality and interest. Visual skills and vision tests. Training of industrial employees. Industrial inspection. Industrial merit rating. Wages and job evaluation. Work, fatigue, and efficiency Accidents and safety Attitudes and morale. Appendixes: Elementary statistical procedures. Taylor-Russell tables. Publishers of tests. Index.

Note. A standard survey of procedures and techniques employed by industry in the application of psychology to employee problems, inspection accuracy training methods, and employee morale. It is used as a guide for persons engaged in personnel work in industry and for psychologists preparing for this field. The second edition was published in 1947 Except for a new introductory chapter, the organization and scope of this third edition are identical with the second edition, but the treatment of many topics has been revised, in many instances, so as to incorporate the results of research published in the period 1946–51

VITELES, MORRIS SIMON

Industrial psychology New York W W Norton & Company, Inc., 1932 652 p illus. 24 cm $7.25 5163

Contents. Preface. Introduction to a study of industrial psychology The economic foundations of industrial psychology Social foundations of industrial psychology The psychological foundations of industrial psychology The rise and scope of industrial psychology. The nature and distribution of individual differences. The origin of individual differences. Basic factors in vocational selection. Job analysis. The interview and allied techniques. Standardization and administration of psychological tests. Tests for skilled and semi-skilled workers. Tests in the transportation industry Tests for other occupations, technical and supervisory employees. Safety at work. Psychological techniques in accident prevention. Accidents in the transportation industry The acquisition of skill. Training methods. Industrial fatigue. The elimination of unnecessary fatigue. Machines and monotony Specific influences in monotonous work. Motives in industry The maladjusted worker. Problems of supervision and management. Acknowledgments. Index to names. Subject index.

Note. Devoted to a discussion of the methods employed, the principles involved, and the results accomplished by industrial psychology in promoting the better effectiveness of man in industry and increasing industrial efficiency It is a comprehensive text, designed for advanced study and use in the field. A bibliography is included.

VITELES, MORRIS SIMON

The science of work. Illustrated by Kinsley R. Smith. New York W W Norton & Company, 1934 442 p illus 22 cm. $4 90 5164

Contents: Preface. Work throughout the ages. Work with machines. Fitness for work. Developing the psychological yardstick. Matching men and occupations. Worse than war. Acquiring skill at work. Making work easy Machines and monotony Making work worthwhile. Salvaging the misfits. Working together. References. Index.

Note. A simpler less technical book than the author's comprehensive survey *Industrial psychology* described above. Material is here selected which will be of immediate interest and use to the practical man in industry

ENGINEERING

GENERAL

BAKER, H. DEAN AND OTHERS

Temperature measurement in engineering. Volume 1. By H. Dean Baker E. A. Ryder and N. H. Baker New York John Wiley & Sons, Inc., 1953 179 p. illus. 24 cm. $4.95 5165

Contents: Temperature. Methods for measuring temperature. Precision requirements. Conditions affecting temperature measurement. The thermocouple thermometer—circuits. Indicating instruments. Design installation techniques. Installation design types. Drilling techniques. Special materials—protective coatings, heat- and corrosion-resistant metals, plastics, refractories, and ceramics. Generalized installation designs. Temperature gradient installation designs. Conclusion to Volume I. Name index. Subject index.

Note: The first volume of a two-volume work designed to provide engineers with a comprehensive account of the techniques employed in temperature measurement. The treatment is nonmathematical and practical, and emphasizes the actual procedures for designing and constructing specific measuring installations. Extensive bibliographies are included to provide data on highly specialized problems which are not covered in the text. This volume deals exclusively with thermocouples or thermoelectric methods of temperature measurement. Volume II will discuss such problems as the measurement of very low and very high temperatures in rapidly moving bodies, liquids, and gases. The senior author is Professor of Mechanical Engineering at Columbia University.

BRADFORD JOHN R., editor

Radioisotopes in industry Contributing authors P. C. Aebersold and others. New York. Reinhold Publishing Corporation, 1953 309 p. illus. 24 cm. $8.00. 5166

Contents: Radioisotopes—a new industry by T. E. Gorman. Radioisotopes for industry by P. C. Aebersold. Fundamentals of radiochemistry by J. R. Bradford. Radiation protection, by G. Gorman. Radioisotopes in physical and chemical research, by G. D. Calkins. Applications of radioisotope techniques, by C. Rosenblum. Radiochemical laboratories, by T. B. Lenahan. Design of laboratories for safe use of radioisotopes, by D. R. Ward. Production and separation of radioisotopes, by A. F. Rupp. Tracer experiments, by R. Flaherty. Instrumentation of the radiochemical laboratory by T. L. Pattengill. Decontamination and the disposal of radioactive wastes, by C. C. Ruchhoft. Industrial uses of radioactive fission products, by P. M. Cook and others. Distribution of radioisotopes by the Atomic Energy Commission, by R. A. Lough. Appendixes. Useful radioactive isotopes, pile-produced. Useful radioactive isotopes, cyclotron-produced. Index.

Note: With one exception the chapters of the book were first presented in April, 1951, as papers at the conference sponsored by the Case Institute of Technology and the Atomic Energy Commission. The purpose of the conference (and of the book) was to make available to scientists and technologists in industry information on the availability, potential applications and manipulation of radioactive isotopes in measurement, inspection and research. Some material not directly related to the book's purpose—for instance material on the production of radioisotopes—is included. Although not a complete manual of the subject, the book contains valuable information for all who are beginning to use radioactive isotopes or who are interested in their industrial applications. Literature references are included with each chapter. Approximately half of the authors are on the staff of the Atomic Energy Commission or the Oak Ridge National Laboratory.

BROWN ROBERT QUIXOTE

Introduction to engineering problems. New York. Prentice-Hall, Inc., 1948. 191 p. illus. 22 cm. $3.25 5167

Contents. Introduction—the objectives of engineering problems. Logarithms and the slide rule. Some basic mathematical principles. Some basic physical principles. Good form in writing. Projects. Index.

Note. The chief purpose of a course in engineering problems is to enable the beginning college student to discover whether he has the aptitudes and interests for a successful engineering career. This text, written for use in such courses, offers basic information in mathematics and physics, together with approximately 300 problems designed to test the student's ability to comprehend such knowledge and to apply it. The writing of engineering reports, letters, and other forms that come within the work of engineers is covered compactly.

CENTENNIAL OF ENGINEERING 1852–1952 INC. Centennial of engineering, 1852–1952 history and proceedings of symposia. Edited by Lenox R. Lohr president. Chicago Centennial of Engineering, 1952 Inc., 1953 1,079 p. 24 cm. $10.00. 5168

Contents (abridged): Book I, The centennial celebration. The centennial idea takes form. Theme and philosophy. Centennial awards luncheon. Centennial evening party. Story of engineering [illegible] The [illegible] of science and industry. Atom to Atom. Appendixes. Book II, The convocation. The rise of the organized profession. Education and training. Food. Texas. Transportation. Mineral industries. Structures and construction. Chemical industries. Communications. Energy. Health and human engineering. Organization. Index.

Note: The centennial of which this volume is a product was that of the American Society of Civil Engineers founded in 1852. However, the celebration was not limited to the achievements of civil engineering but was general in scope and designed to call attention to the accomplishments of engineering. The first part of the book contains the official history and general proceedings. The appendixes to this part contain the names of officers, directors, sponsors and participating societies. The second and larger part of the book contains the proceedings of 12 symposia whose titles are given above. Generally speaking, each symposium consisted of introductory remarks, several short papers and discussion, all of which are published in this volume. The book contains many valuable papers and much interesting information, but its bulk will frighten away many readers. The brevity of the index will discourage reference use except by the very determined.

CHRISTMAN RUTH C editor

Industrial science, present and future. A collection of papers presented at the installation of the Section on Industrial Science of the AAAS at the Philadelphia meeting on December 28–30 1951 Arranged by Allen T Bonnell. Edited by Ruth C. Christman. Washington, D C. American Association for the Advancement of Science, 1952. 152 p. 23 cm. $2.00. 5169

Contents: Bridging the gap, by E. R. Weidlein. Industrial science today: The petroleum industry by R. E. Wilson. The steel industry by H. G. Batcheller. The communications industry by J. B. Fisk. The chemical industry by N. A. Shepard. The pharmaceutical industry by E. H. Volwiler. Industrial science tomorrow: Horizons in industrial science from the viewpoint of the consultant, by L. M. Gilbreth. Horizons in industrial science from the viewpoint of the educator, by J. Cronin. Horizons in industrial science from the viewpoint of the research institute, by F. C. Croxton. Horizons in industrial science from the viewpoint of government, by A. T. Waterman. The contributions of industry to scientific education, by C. L. Emerson. Industrial science and community health, by C. L. Dunham. The new industry and the community, by R. A. Neary. Industrial science and its public relations, by G. E. Pendray.

Note. In the papers collected here, some of the history achieve-

ments, and problems and the outlook for the future of industrial science are outlined. By the term "industrial science," the authors collectively have designated not only research on the part of industry but also such other aspects as industry's relation to scientific education, and relations between government research and industrial research. The papers are addressed to the general public rather than to specialists; however, they are of interest to scientists who are concerned with the larger and social aspects of science.

CRISPIN, FREDERIC SWING

Dictionary of technical terms, containing definitions of commonly used expressions in aeronautics, architecture, woodworking and building trades, electrical and metalworking trades, printing, chemistry, etc. Seventh edition, revised. Milwaukee: The Bruce Publishing Company, 1946. 427 p. illus. 20 cm. $4.75 5170

Note. A dictionary for students, draftsmen, mechanics, builders, electricians, and workmen generally. No attempt has been made to include all the technical terms in any field. Instead, a selection of the terms most likely to be encountered by the workman in his daily work is provided. The present revision has been enlarged by the inclusion of additional terms and definitions relating to aeronautics, automechanics, electricity, plastics, and welding.

CROUCH, W. GEORGE, AND ROBERT L. ZETLER

A guide to technical writing. Second edition. New York: The Ronald Press Company, 1954. 441 p. illus. 22 cm. $5.50 5171

Contents: The technical man's writing problems. The business letter—form and substance. Types of technical letters. The formal technical report. Informal and memoranda reports. The technical and semitechnical article. Language essentials and types of technical exposition. Speaking techniques. Index to English usage. Appendixes: Selected bibliography; General reading list. Index.

Note. A guide to the use of good and effective English in technical reports, articles, lectures, etc. It includes some information on the organization and format of forms of technical literature, but is not a full-scale treatment of this aspect of the subject. It is used primarily as a textbook. However, its organization and an adequate index make it suitable for use as a desk reference book for scientists and engineers who feel the need for a handbook of English usage.

DALTON, BLANCHE H.

Sources of engineering information. Berkeley: University of California Press, 1949. 109 p. 24 cm. $4.00 5172

Contents: Indexes to periodical and serial literature. Abstracts. Location of articles—identification of periodicals. Bibliography. Reference books. The trade catalog collection. Standards and specifications.

Note. A selected bibliography of indexes, abstract journals, lists of periodicals, bibliographies, book selection guides, reference books, etc., in the field of engineering. The list of reference books is the major section, accounting for 70 of the 109 pages. Within the sections whose titles are given above, entries are organized under specific subheadings. Each entry provides such information as authors' names (if there is an author), title, place of publication, publisher and year of publication (of the first volume in the case of periodicals). Although now somewhat out of date, especially in some subsections of the list of reference books, it is still a useful list. The author is librarian of the Engineering Library of the University of California.

DE VRIES, LOUIS

English German technical and engineering dictionary. New York: McGraw-Hill Book Company, 1954. 997 p. 24 cm. $22.50 5173

Note. A major bilingual dictionary. It gives the equivalents in the German language of more than 130,000 English language technical and engineering terms. Abbreviations are also included. Most of the terms and abbreviations are from the various fields of engineering.

DE VRIES, LOUIS

German English technical and engineering dictionary. New York: McGraw-Hill Book Company, Inc., 1950. 928 p. 23 cm. $22.50. 5174

Note. The English equivalents of approximately 115,000 German scientific terms are given in this reference book. A considerable number of the terms are derived from private glossaries compiled by professional translators and research workers from the recent literature. Many of these have not appeared in other dictionaries. A feature that adds much to the book's usefulness is the inclusion of a high number of combinations and variants. The main list is supplemented by a 16-page list of abbreviations with their German meanings and English equivalents.

ESHBACH, OVID WALLACE

Handbook of engineering fundamentals. Prepared by a staff of specialists under the editorship of Ovid W. Eshbach. Second edition. New York: John Wiley & Sons, Inc., 1952. 1,314 p. illus. 22 cm. $11.00 5175

Contents (abridged): Mathematical and physical tables. Mathematics. Physical units and standards. Mechanics of rigid bodies. Mechanics of deformable bodies. Mechanics of incompressible fluids. Aerodynamics. Engineering thermodynamics. Electricity and magnetism. Radiation, light, and acoustics. Chemistry. Metallic materials. Non-metallic materials. Engineering law. Index.

Note. A comprehensive handbook of fundamental theories, data, and formulas essential in engineering practice. It is designed for use by engineers in all branches of engineering. The contents given above are the titles of the sections. In most instances a section is composed of several subsections, each one of which is the work of an authority whose name is given. Bibliographies accompany the subsections, but the index is all-inclusive. The first edition appeared in 1936. In the new edition, some of the sections have been reorganized and all of them revised to some extent. A fair number have been completely rewritten.

FINCH, JAMES KIP

Engineering and Western civilization. New York: McGraw-Hill Book Company, Inc., 1951. 397 p. illus. 24 cm. $6.50 5176

Contents (abridged): Ancient engineering. The Middle Ages and the Renaissance. The age of French leadership. Early British engineering. The Victorian era. American engineering in the 19th century. The new engineering. Modern engineering. Engineering and Western civilization. Engineering and economic change. Engineering and the worker. The distribution of technological gains. Technological change and capital goods. Engineering and research. Conclusion. Bibliography. Index.

Note. In this outline history of engineering, Dr. Finch takes as his thesis that engineering and technological advances have exercised a greater influence on the growth of modern institutions than have philosophic, economic, or social forces. Except for a brief survey of the growth of engineering from ancient times to the Victorian era, the author deals entirely with the part played by the engineer in the evolution of the United States of America. The book is intended primarily for use in introductory engineering courses, but it can be recommended also for general reading. It includes a valuable and extensive annotated bibliography.

FINCH, JAMES KIP

A history of the School of Engineering, Columbia University. New York: Columbia University Press, 1954. 138 p. illus. 26 cm. $2.75 5177

Contents: Introduction. Preparing the way. The founding of the School of Mines. Mines in transition. The birth of the departments. The earlier years at Morningside. A new era—postwar reorganization. Graduate instruction and research. World War II and its aftermath. Looking ahead. Index.

Note: An official history of one of the most influential engineering schools in the United States of America, and of its parent, the Land of Hope. The volume is replete with the names of famous engineers and teachers of engineering, but the main story is the gradual evolution of engineering education in the United States as the nation developed from colonial possession to the highest rate of industrialization of any country in the world.

HERTZ, DAVID BENDEL

The theory and practice of industrial research. New York McGraw Hill Book Company Inc., 1950. 385 p. illus. 23 cm. (McGraw Hill *engineering management series* R. T Livingston, consulting editor) $7.50 5178

Contents: Introduction. The creative mentality and research problems. Methods of problem solving in research. The method of research. The background of research in industry. Research projects and programs. The magnitude of research projects and programs. The organization and administration of research personnel. Research finances and budgeting. Internal relationships in the research group. Formal and informal research reports. Research facilities—laboratory design, research tools, and auxiliary services. Patent policies in research. External relationship of the research department. Bibliography. Index.

Note: The first chapters contain a careful analysis of the nature and general problems of research, then the author turns his attention to the practical organization and administration of research in industry. In both parts he has something worthwhile to say. The work is intended for use as a textbook in courses offered to advanced science and engineering students, but it is of interest to graduate workers in industrial research and corporation executives as well. There is a good bibliography.

HOOVER, THEODORE JESSE, AND JOHN CHARLES LOUNSBURY FISH

The engineering profession. Second edition. Stanford Stanford University Press 1950 486 p. illus. 23 cm. $7.50. 5179

Contents: Who is an engineer? What is engineering. Fields and functions of engineering. Civil engineering. Mining engineering. Mechanical engineering. Electrical engineering. Chemical engineering and other fields. The method of engineering. Application of the engineering method. Uncertainties in engineering. Vocational guidance in engineering. Education of the engineer. The new call to the engineering profession. Appendix: Some definitions of engineering. Requirements for admission to membership in engineering societies. Engineering codes. Index.

Note: A full, well-written description of the engineering profession. It is addressed to secondary school students who are contemplating careers as engineers and to teachers and vocational counselors who advise young people on the choice of careers. The types of engineering activities, how engineers go about their work, what an engineer's education must be, are the topics rather than the technology of engineering. However, typical engineering problems are included in the discussion, and there are selected lists of engineering literature. Some statistical data on salaries, distribution of engineers, etc. are included, but this information is now out of date.

INDUSTRIAL RESEARCH INSTITUTE, INC

Research in industry its organization and management prepared by and published for Industrial Research Institute, Inc. C. C. Furnas, editor New York D Van Nostrand Company Inc., 1948. 574 p. illus. 23 cm. $8.50. 5180

Contents: The philosophy and objectives of research in industry. The research laboratory as an operating department of the company. Development. The research director's job. Organization charts in theory and practice. The research program. Selecting projects for research. The research budget. Research reports. Characteristics of the research man and the research atmosphere. Qualifications, training, aptitudes and attitudes of industrial research personnel. Procurement and selection of research personnel. Salary policy. Personnel policies and personality problems. Professional growth of the research man. The location, design, and construction of a modern research laboratory. The tools of research. Instruments and supplies. The research unit. Adjunct: Service personnel and facilities. Translating research results into new products and factory procedures. By-products of research. Evaluating the results of research. The research director's responsibility in determining the company patent policy. Pattern of collaboration between the research department and the patent department. Licenses, royalties and patent pools. Relations with the public and government. Relations with the educational system. Relations with other firms and industry. Research in America and Europe. Goals and problems for the future. Appendices. Index.

Note: The material in this volume is authentic. Twenty-nine of the contributors are associated in executive capacities with the research programs of prominent American corporations, and the other four are associated with the National Research Council and other organizations concerned with the fostering of research. It is addressed primarily to administrators, but some lay readers will find it of interest, particularly for the light it throws on industry's view of the importance of research. The appendices contain an extensive bibliography and also sample forms for agreements between employers and research personnel.

KEREKES FRANK AND ROBLEY WINFREY

Report preparation, including correspondence and technical writing Second edition. Ames The Iowa State College Press, 1951 448 p. illus. 29 cm. $7.50. 5181

Contents (abridged): Reports. Planning the investigation and report. Collection of information. Mechanics of style. Format and arrangement. Tabular presentation. Preparation of illustrations. Effective writing. Writing the first draft and revising. Correspondence. Letter reports and short reports. Formal reports. Magazine feature articles and technical papers. Oral presentation of reports and technical papers. Letter of application. Editing, copyreading and proofreading. Appendix. Index.

Note. The authors of this book have taken plenty of time and have produced a full book that will be used not only in instruction but after graduation as a reference book. Numerous full-size examples of charts, graphs, business letters, employment applications, sample title pages and other illustrations of forms much needed by scientists and engineers in their work after graduation are included. The accompanying discussions are factual and practical.

KILLEFFER, DAVID HERBERT

The genius of industrial research. New York Reinhold Publishing Corporation, 1948. 263 p. illus. 23 cm. $5.00 5182

Contents: Industrial research is methodical. The dual nature of research. Stating the problem. Two basic methods of research. Thinking out the problem. Process research. Product research. Equipment research. The progressive development of an idea. Three illustrative researches. The pilot plant and what happens there. Reports are essential. Evaluating research. Something about patents. Loose ends gathered here. Index.

Note: The author believes that the "genius" of industrial research lies in planned, methodical investigations and accumulation of knowledge rather than in the kind of spontaneous inspiration that is popularly thought of as genius. His purpose has been to show by exposition and example how a definite pattern of industrial research can be learned, and how a scientific method of working and thinking can be cultivated by the young research worker. Part of the book's interest lies in its presentation of case histories of a number of notable investigations, most of which are quoted from the papers of successful industrial chemists.

KIRBY RICHARD SHELTON, AND OTHERS

Engineering in history By Richard Shelton Kirby Sidney Withington, Arthur Burr Darling and Frederick Gridley Kilgour New York McGraw Hill Book Company Inc. 1956 530 p. illus. 24 cm. $8.50. 5183

Contents: Origins. Urban society. Greek engineering. Imperial civilization. The revolution in power. Foundations for industry. The industrial revolution. Roads, canals, bridges. Steam vessels and locomotives. Iron and steel. Electrical engineering. Modern transportation. Sanitary and hydraulic engineering. Construction. Reflections. Index.

Note: The title of the book might be taken to indicate that its subject is the influence of engineering upon history. Actually the book is primarily a history of Western engineering, or of engineering in the Western world. The contributions of other civilizations to en-

ciety is a recurrent but secondary theme. The time span is from the first recorded examples of engineering down to the technology of our own times. The authors have succeeded in making the achievements of engineers potentially interesting for most readers, both those with some knowledge of technology and those without. Furthermore, they have done this by describing the achievements themselves rather than by devoting space to personalities and anecdotes. Included are a moderate number of illustrations, selected literature references and a good index.

LEIDECKER, KURT FRIEDRICH, editor

German English technical dictionary of aeronautics — rocketry — space navigation — atomic physics — higher mathematics — jet engines — turbines — hydraulics — petroleum industry — civil and mechanical engineering — ballistics — electronics — radio — radar — aerophotography — television — infrared research — communication — meteorology — topography — aeromedicine. Based on data compiled by the U S Air Force. New York S F Vanni, 1951 2 v 28 cm $35 00 5184

Note The terms for this dictionary and the English equivalents were compiled by the Dictionary Unit which was first associated with the United States Strategic Air Forces in Europe and later was transferred to the Air Documents Research Center in Dayton, Ohio. Definitions are short, and no examples of usage are included. The work's merit lies in the inclusion of many terms in aeronautics and related fields which are not to be found in other dictionaries. Another edition of the work was previously made available to government agencies and to contractors of the United States Armed Forces, but this is the first edition to be offered generally

LEY, WILLY

Engineers' dreams Diagrams and maps by Willy Ley Illustrations by Isami Kashiwagi. New York The Viking Press 1954 238 p. illus 24 cm. $3 50 5185

Contents Forbidden tunnel. Islands afloat. The tamed volcano. The Valley of the Jordan. Africa's central lake. Atlantropa—the changed Mediterranean. Power from the sun. Waves and warm water Harnessing the winds. Epilogue. Index.

Note. Not quite all of the wonderful schemes in this book are "dreams, for volcanoes, or at least subterranean heat, has already been harnessed for industrial use. However this exception is excusable, for the other dreams include such grand schemes as Herman Sorgel's proposal for adding to the land masses of Europe and Africa and at the same time creating hydroelectric generating plants of great capacity by damming off the Mediterranean Sea. The author is skilled writer and the book is good example of how technical things can be made interesting to nontechnical readers.

McCLOY, SHELBY T

French inventions of the eighteenth century Lexington University of Kentucky Press, 1952 212 p illus. 25 cm. $4 50 5186

Contents The balloon. Steam transportation. The telegraph. Lighting. Papermaking. Chemical inventions. Textiles. Automata. Other mechanical devices. Military inventions. Medicine and surgery Patents and encouragement. Conclusion. Bibliography Index.

Note. A readable, well-documented survey of French inventive activity during the 18th century Although individual inventions are described and illustrated, the main theme is the strong current of activity This is delineated against the social and political background. Inventors are named, and there are occasional remarks on individual personalities and fortunes but the biographical aspect is not emphasized. There are many scholarly footnotes and an extensive bibliography

MAUK, JAMES F , compiler

Industrial research laboratories of the United States. Tenth edition. Compiled by James F Mauk, with the assistance of Harold Peacock, Melvin S Ruffner Under the direction of Charles I Campbell. Washington, D C National Academy of Sciences —National Research Council, 1956 560 p. 26 cm (National Academy of Sciences—National Research Council Publication 379) $10 00 5187

Note. In its tenth edition, this well known reference book unchanged in scope but considerably enlarged in content. As before, it is a directory of nongovernmental research laboratories including laboratories maintained by commercial firms, independent commercial laboratories, laboratories maintained by trade associations and independent nonprofit laboratories. Testing laboratories and university laboratories are not included. Information about each laboratory includes name of the organization, address, name of the president and, in some cases, other executive officers, name of the director of research, size and makeup of the research staff and a condensed statement of research activities. The information given was obtained by means of mailed questionnaires; hence, there are variations in fullness from one entry to another. The main part of the volume is arranged alphabetically by name of firm. A geographical index and a detailed subject index to research activities are included. In this edition there are 4,060 entries representing 4,834 laboratories, an increase of approximately 30 per cent over the preceding edition.

MEES, CHARLES EDWARD KENNETH, AND JOHN A. LEERMAKERS

The organization of industrial scientific research. Second edition. New York McGraw Hill Book Company, Inc., 1950 838 p. 24 cm. $7 00 5188

Contents (abridged) Part I, General principles: The development of scientific organization. Industrial research. Part II, Agencies for the conduct of industrial research. Government laboratories. Associations for industrial research. Technological research institutes. Some large industrial laboratories. Part III, The organization and operation of industrial laboratories. The position of the laboratory in a company The direction of research. The transfer of research to production. Reports, patents, publications, and library The financial administration of the laboratory The design of laboratory for specific industry Index.

Note. This book deals chiefly with the setting up and administration of research laboratories in industrial corporations. The authors are associated with the Eastman Kodak Company However, they have taken a general view of the subject and have drawn liberally from the experiences of other companies. The work is of interest both to staff members of industrial laboratories and to executive officers of corporations who are concerned with general company policy The first edition, written by the senior author alone, was published in 1920. This edition is largely new even though the viewpoint is the same.

MILLER, WALTER J , AND LEO E A SAIDLA, editors

Engineers as writers growth of a literature. With a foreword by H. S Rogers. New York D Van Nostrand Company, 1953 340 p. illus 22 cm. $4 75 5189

Contents Engineers as writers. Vitruvius and the holy ground. Frontinus' classic report. Agricola's classic treatise. Smeaton founds literature. McAdam's sharp remarks. Rankine's manuals. Wellington's memorable sentences. Lamme's papers. Parsons' addresses. Taylor's principles. Pupin's autobiography Ammann's reports. Benedict and Rubin collaborate. Hoover reports to the public. Raymond well-tempered paper. Bibliography Index.

Note An anthology of engineering writing which has been edited and organized primarily for study by engineering students. The range in time of the works represented is 27 to 1935 A.D. Most of the selections are from works, significant as landmarks in the development of engineering, which are noted also for simplicity and clarity of style. Each selection is supplemented by historical and biographical data and a critical comment written by the editors.

Mills, Gordon H. and John A. Walter
Technical writing. New York Rinehart & Company Inc., 1954 463 p. illus. 23 cm. $4.50. 5190

Contents: Section one, Preliminary problems: Introduction. Five basic principles of good technical writing. Style in technical writing. Outlines and abstracts. Section two, Special techniques of technical writing: Definition. Description of a mechanical device. Description of a process. Classification and partition. Interpretation. Section three, Transitions, introductions, and conclusions: Transitions. Introductions. Conclusions and summaries. Section four, Types of reports: The progress report. Recommendation reports. Special types of report organization. Oral reports. Business letters. Writing for professional journals. Section five, Report layout: The format of reports. Graphic aids. Section six, The library research report: Finding published information. Writing the library research report. Appendixes. Index.

Note: An outstanding introductory textbook, primarily designed for the instruction of engineering students. It is concerned with the nature of technical reports and related technical writing and with the techniques of technical writing which are different from other forms of writing. It is not a reference book of grammar, punctuation, etc., or of typical reports. A noteworthy feature is the inclusion of the full text of an actual report, with commentaries by the authors on not only the organization of the report but also on the clarity, grammar, etc., of specific passages. Also included are both the first and final versions of a report written by John L. Gait which won a prize in a contest sponsored by the American Institute of Electrical Engineers.

Nelson, J. Raleigh
Writing the technical report. Third edition. New York. McGraw Hill Book Company Inc., 1952 356 p. illus. 24 cm. $4 95 5191

Contents (abridged): Part I, The design of the report. Part II, Some suggestions as to the form and style of the report. Part III, The concerns of the report. Part IV, Summary of basic principles. Part V, Manual for class use. Index.

Note: In this text for both practicing and student engineers, emphasis is placed on the basic principles and procedures which should be followed in preparing technical reports, rather than on the form of specific types of report. Thus, although numerous sample reports are included, the book is not intended to serve as a form or style manual. The major changes in this edition are found in the latter part of the volume, where the basic principles previously discussed at length are now summarized and where an outlined course in report writing has been added.

Ogburn, William Fielding, editor
Technology and international relations. Chicago The University of Chicago Press, 1949 201 p. illus. 23 cm. $4.00 5192

Contents: Introductory ideas on inventions and the state, by W. F. Ogburn. The process of adjustment to new inventions, by W. F. Ogburn. Technology and the growth of political areas, by H. Hart. The atomic and steel complex and international relations, by A. R. Ueber. Aviation and international relations, by W. F. Ogburn. Atomic energy and international relations, by W. T. R. Fox. The mass-communications inventions and international relations, by R. Leigh. New techniques of war and national policies, by B. Brodie. Modern technology and the world order, by Q. Wright. Index.

Note: The lectures delivered at the 24th Institute of the Norman Wait Harris Memorial Foundation of the University of Chicago are collected in this volume, together with an introduction by the editor. The main theme is the effects of technology, or clusters of inventions, upon international relations. The portions of the atomic bomb occupies much of the discussion. The lectures were addressed to laymen, and the book is worthwhile reading for almost any educated reader interested in the social impact of science and technology.

Oliver, John W
History of American technology New York The Ronald Press Company 1956 676 p. 24 cm. $6 50 5193

Contents (abridged): Part I, Yankee ingenuity: from Jamestown and Plymouth to the American Revolution: Transplanting of tools, skills, and techniques. Advances in agricultural technology. Advances in building technology to the Revolution. Clothing and leather technology. Early transportation and communication technology. Role of science in early American technology. American technology during the Revolution. Part II, Laying the foundations: from the American Revolution to the Civil War: Building an empire of science. Passing of the Homespun Age. Transportation technology to 1850. Water transportation technology to 1850. The communications revolution to 1860. The revolution in agricultural technology to 1860. A nation alert to science. American technology goes abroad. Technology in the Civil War. Part III, Rise of the United States as world power: Civil War to 1900. The nation's awareness of science and technology to 1900. The age of steel. The birth of the petroleum industry. The coming of the electrical age. Agricultural technology. Food technology. Clothing technology—boots and shoes. Building technology. Transportation technology. Communication technology. Part IV, World leadership: from 1900 to the present. Science and technology help make America a world power—1900 to World War I. Transportation and communication technology—1900 to World War I. Motion picture technology. Technology in World War I. Communication technology since 1920. Transportation technology since World War I. Technological advances in metallurgy since 1920. Technological advances in nonmetallic industries since 1920. Technology in World War II. Today's technologies. Index.

Note: The part and chapter titles of this distinctive work indicate the breadth of its coverage, but they cannot do justice to the detail. The author has not only described the processes, but has also included thousands of small facts, such as the number of patents issued in the year 1860, the number of the Edison Company's customers in 1890, and the consequences of the famine in natural ice in 1889/90. Devices seldom heard of, such as machines for preparing canned corn, are described, along with better known inventions. The author's style, though pedestrian, is pleasant to read. The book lacks pictures, and the short reference lists are not intended to meet the needs of scholars.

O'Rourke, Charles Edward, editor
General engineering handbook editor-in chief Charles Edward O'Rourke. Associate editors, Thomas R. Agg Harry Bouchard Walter B Carver and others. Second edition New York McGraw Hill Book Company Inc., 1940 1 120 p. illus. 21 cm $10 00 5194

Contents: Mathematics, by M. G. Malti. Mathematical tables, by W. B. Carver. Physical tables, by C. E. O'Rourke. Engineering materials, by H. H. Scofield and G. Murphy. Theoretical mechanics, by A. P. Poorman. Hydraulics, by F. M. Dawson. Structural theory and design, by E. S. Sherry. Plain and reinforced concrete, by C. E. O'Rourke. Foundations, by R. P. Davis. Topographical and geodetic surveying, by H. Bouchard. Route surveying and earthwork, by T. F. Hickerson. Highways, by T. R. Agg and R. A. Moyer. Municipal sanitation, by J. J. Doland and E. W. Steel. Machine elements, by R. C. H. Heck. Pumps, compressors and hydraulic turbines, by R. L. Daugherty and F. G. Switzer. Engineering thermodynamics, by J. E. Emswiler and others. Heating and air conditioning, by C. O. Mackey. Fundamentals of electrical engineering, by M. G. Malti. Electrical measurements, by C. E. Tucker. Index.

Note: A reference work for practicing engineers and students covering the elements of all branches of engineering. The purpose is not to supplant the detailed handbooks devoted to each of the special fields of engineering, but to supply a compact summary of important fundamentals, so that the specialist may gain some familiarity with those divisions outside his particular field. A knowledge of general engineering theory and practice as well as a fundamental knowledge of college mathematics is assumed. The second edition omits some of the more specialized sections of the first edition and expands the fundamental sections of mathematics, materials, mechanics, and hydraulics. There is new material on plain concrete, structural theory, engineering thermodynamics, and electrical engineering.

Robb, Louis Adams
Engineers dictionary Spanish English and English-Spanish. Second edition. New York John Wiley & Sons, Inc., 1949 664 p. 22 cm. $12.50. 5195

Note: In its second edition this useful dictionary has been considerably enlarged. Radio and television terms are now included, and larger branches of engineering, such as civil, mechanical, and mining, are given more thorough coverage. As in the earlier edition, terms whose usage is more or less confined to a single Latin-American country are identified with a symbol which designates the country. In contrast to some technical dictionaries, this one is not

padded out with terms from the general literary language but is confined to engineering terms and terms closely related to fields of science and technology

ROSSNAGEL, W E

Handbook of rigging New York McGraw Hill Book Company, Inc., 1950 321 p illus. 24 cm $6 00 5196

Contents. Fundamentals. Fiber rope. Wire rope. Hoisting chains and hooks. Slings. Wood for structural purposes. Planks for scaffolds. Testing scaffold planks. Swinging and suspended scaffolds. Scaffolding. Painting and repairing steel stacks. Life belts, boatswain's chairs, and life nets. Ladders. Strength calculations for timbers. Strength calculations for metal beams. Cranes, hoists, and derricks. Chain hoists. Jacks, rollers, and skids. Hoist signals. Accident prevention. Caring for the injured. Reference codes, laws, and standards. Appendix Handy reference tables. Index.

Note An important book for all who are concerned with scaffolding, hoisting machinery and related equipment. The material is presented from the viewpoint of those who will make practical use of it, such as machine operators, foremen and safety engineers. There is a generous number of illustrations, and the chapter of "Reference codes, laws, and standards available from state governments and other agencies concerned with safety in the United States of America is a useful feature.

SELL, LEWIS L

English Portuguese comprehensive technical dictionary of aircraft, automobile, railways, shipping, electricity, electronics radio television, telephone photography, photogrammetry building construction, aircraft and antiaircraft armaments sporting, commercial terms, hydraulics, mechanics, pneumatic tools civil engineering, steam, automotive & diesel engines boilers, paper office equipment, sugar mill machinery, metallurgy sheet metal work textiles machine tools agricultural implements paints & dyes mining, carpentry petroleum, steel products 500,000 English and Portuguese technical terms. New York McGraw Hill Book Company, Inc. 1953 1 168 p 28 cm $35 00 5197

Note. Undoubtedly the most comprehensive bilingual dictionary of its kind. It reads from English to Portuguese.

SELL, LEWIS L

English Spanish comprehensive technical dictionary of aircraft, automobile electricity, radio television aircraft & anti aircraft armaments aerial photographic mapping agricultural implements, sporting commercial terms mechanics & machine tools steam automotive & diesel engines boilers, paints & dyes office equipment sugar mill machinery petroleum steel products detailed treatment of specific technical idiom current in the various Spanish-speaking countries and the differences between British English and American English—complete cross referencing—synonyms and antonyms. 525 000 English and Spanish technical terms New York McGraw Hill Book Company Inc. 1944 1 478 p 28 cm. $35 00 5198

—— Spanish English comprehensive technical dictionary of aircraft, automobile, railways, highways, electricity, electronics, radio, television, photography & photogrammetry, aircraft & anti aircraft armaments, sporting & baseball, commercial terms, hydraulics, mechanics, pneumatic tools, civil engineering, steam, automotive & diesel engines, boilers, paper, office equipment, sugar mill machinery, metallurgy sheet metal work, machine tools, agricultural implements, paints & dyes, petroleum, steel products, detailed treatment of specific technical idiom current in the various Spanish speaking countries, and the differences between British English and American English—complete cross referencing—synonyms and antonyms. 700 000 Spanish and English technical terms. New York McGraw Hill Book Company, Inc., 1949 1,706 p. 28 cm $40 00 5199

Note Together these complementary works constitute the most comprehensive bilingual dictionary available of Spanish and English technical terms. As noted in the title of the English-Spanish volume, attention is paid not only to differences among the various Spanish-speaking countries, but also to the differences between British and American usage.

TIMOSHENKO, STEPHEN P

The collected papers of Stephen P Timoshenko New York McGraw Hill Book Company, 1953 642 p. illus. 24 cm. $15 00. 5200

Contents. Biographical sketch. List of early Russian papers. Einige Stabilitätsprobleme der Elastizitätstheorie. Erzwungene Schwingungen prismatischer Stäbe. Sur la stabilité des systèmes élastiques. Zur Frage nach der Wirkung eines Stosses auf einen Balken. Étude de la flexion des barres. Über die Biegung der allseitig unterstützten rechteckigen Platte unter Wirkung einer Einzellast. On the torsion of a prism, one of the cross-sections of which remains plane. A membrane analogy to flexure. On the transverse vibrations of bars of uniform cross-sections. On the distribution of stresses in a circular ring compressed by two forces acting along a diameter. Bending stresses in curved tubes of rectangular cross-section. The bending and torsion of multithrow crankshafts on many supports. The pendulum hardness tester. Determination of the modulus of elasticity. Kippsicherheit des gekrümmten Stabes mit kreisförmiger Mittellinie. Über die Biegung von Stäben, die eine kleine anfängliche Krümmung haben. On stresses in a plate with a circular hole. The approximate solution of two-dimensional problems in elasticity. Deflections of a uniformly loaded circular plate with clamped edges. Analysis of bi-metal thermostats. Method of analysis of statical and dynamical stresses in rail. Stress concentration produced by fillets and holes. The stiffness of suspension bridges. Vibration of bridges. Über die Biegung von Trägerrosten. The stability of the webs of plate girders. Buckling of flat curved bars and slightly curved plates. Bending of rectangular plates with clamped edges. Theory of suspension bridges. Theory of bending, torsion and buckling of thin-walled members of open cross-section. The forced vibrations of [illegible]. Stress concentration and fatigue failures.

Note. During his long and eventful career Professor Timoshenko has written engineering papers in four languages, the more important, published in French, German, or English, have been collected in this volume. A list of his papers published in Russian is included with the titles translated into English and citations given to the periodicals in which they appeared. The 15-page biographical sketch which precedes the papers was written by D. H. Young. The book is a tribute to a great engineer and teacher rather than being a volume to be read for new engineering information; hence an index was appropriately omitted.

TUTTLE, ROBERT E., AND C. A. BROWN

Writing useful reports: principles and applications. New York: Appleton-Century-Crofts, Inc., 1956. 635 p. illus. 19 cm. $4.50. 5201

Contents: Part I, Writing useful reports: Why write reports? What to use in building the report. A basic pattern and some guides. Using the guides. Using prefatory material. Using introductions. Concluding. Organizing the developing sections. Presenting the facts. Using illustrations. Using the help of others. Writing and checking. Helping the reader by good format. Using available sources. Keeping notes. Part II, Applications: Reports showing how the basic patterns are modified. Reports for supplementary study. Appendix. Index.

Note: According to the authors of this book, all reports, whatever the subject or purpose, consist of basic elements which may be arranged to suit specific sets of circumstances. These elements and other matters of general application, such as format, are discussed in the 171-page first part. The longer second part contains a variety of reports in which the applications of the ideas set forth in the first part of the volume are illustrated. The book was developed in college courses and is used primarily as a college text. However, it is suitable for reading by any college graduate who wishes to acquire a thorough understanding of report writing.

UNITED STATES. OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT

Applied physics: Electronics, a history of Divisions 13 and 15 and the Committee on Propagation, NDRC, edited by C. G. Suits, with a foreword by Karl T. Compton. Optics: a history of Divisions 16 and 17, NDRC, by H. Kirk Stephenson and Edgar L. Jones, edited by George R. Harrison. Metallurgy: a history of Division 18, NDRC, by Louis Jordan. Boston: Little, Brown and Company, 1948. 456 p. illus. 22 cm. (Science in World War II) $6.00. 5202

Contents (abridged): Book one. Electronics. Part one, History of Division 15, NDRC. Beginning of radio countermeasures. Transition and liaison with the services. The American British Laboratory (ABL-15) as organization. Airborne Instruments Laboratory. Antennas. Tube developments. Evaluation of radar countermeasures. Part two, History of Division 13, NDRC. Microwave communications research. Direction finder research. Ionosphere and radio propagation studies. Central communications research. Part three, History of the Committee on Propagation, NDRC. Meteorology. Forecasting. Storm detection by radar. Book two. Optics. New optical instruments. Camouflage projects. Advances in aerial control. Book three. Metallurgy. Part one, History of organization and operations. The War Metallurgy Committee. Part two, Specific fields of metallurgical research and the participating agencies. Aircraft materials. Guns and gun steels. Metals for high-temperature service. Welding—ships. Foundry materials and processes. Personnel index. Subject index.

Note: A comprehensive review of the research carried on during World War II in the fields of physics, electronics, and metallurgy by the thousands of scientists, engineers and subject specialists mobilized by the Office of Scientific Research and Development. The book describes the way in which such highly diversified instruments and techniques as radar countermeasures, land mines, infrared telescopes, reliable signalling, armor-piercing shot, etc., were developed, improved, and brought to practical war-time use. Because of the comprehensiveness little technical data are included, and each topic is discussed only in nontechnical form.

USHER, ABBOTT PAYSON

A history of mechanical inventions. Revised edition. Cambridge: Harvard University Press, 1954. 450 p. illus. 25 cm. $9.00. 5203

Contents: The place of technology in economic history. Historical analysis of social change. The particular systems of events. The emergence of novelty in thought and action. The early history of the pure, applied mechanical sciences. The mechanical equipment of pre-Christian antiquity. The development of water wheels and windmills, 150 B.C.–A.D. 1500. Water clocks and mechanical clocks, 16 B.C.–A.D. 1550. Leonardo da Vinci, engineer and inventor. The invention of printing. Machinery of the textile industries, 100–1800. The development of clocks and watches into instruments of precision, 1500–1800. The production and application of power, 1500–1830. The production and application of power, 1830–1930. Machine tools and quantity production, 1450–1850. The production and distribution of power since 1832. Notes. Bibliography. Index.

Note: The role of technology in economic change is the principal subject of this book, and the introductory chapter is the key one. In the succeeding chapters, however, the author gives a detailed and valuable account of selected inventions and technical developments. Those inventions selected for discussion are named in the chapter titles. In this revised edition the first four chapters are new. Some new information has been incorporated in the chapters carried over from the second edition, notably in the chapters on clocks and on the machinery of the textile industry.

WATERBURY, LESLIE ABRAM

Waterbury's vest pocket handbook of engineering, revised by H. W. Reddick, W. M. Lansford, C. O. Mackey, H. H. Higbie and H. S. Bull. Fourth edition. New York: John Wiley & Sons, Inc., 1947. 386 p. illus. 14 cm. $3.95. 5204

Contents: Algebra. Trigonometry. Mensuration. Analytic geometry. Differential calculus. Integral calculus. Theoretical mechanics. Mechanics of materials. Mechanics of fluids. Heat engineering. Electrical engineering. Illumination engineering. Radio and electronics formulas. Tables. Index.

Note: A convenient reference book for use in the field and shop, because it can literally be carried in a vest pocket. The data presented in each chapter are the more commonly needed facts, definitions and formulas. This edition has been extensively revised, and data pertaining to heat transfer, illuminating engineering and mensuration have been added.

WEIL, B. H., editor

The technical report: its preparation, processing, and use in industry and government. New York: Reinhold Publishing Corporation, 1954. 485 p. illus. 24 cm. $12.00. 5205

Contents: Part I, Functions: The technical report in industry, by A. L. Fox. The technical report in government, by L. M. McKenna. Part II, Preparing and processing: Writing the technical progress report, by J. C. Lane. Writing the formal technical report, by M. H. Graham and R. R. Carey. Common faults and recommended practices in writing technical reports, by D. S. Davis. Writing the literature summary, by B. H. Weil. The oral report, its preparation and presentation, by B. A. Jones. Editing technical reports, by D. S. Davis. Style manuals for technical reports, by B. H. Weil. Illustrating, duplicating and binding the technical report, by B. A. Jones. Making graphs and tables more effective, by J. C. Lane. Part III, Distributing: Distributing the company technical report, by L. Shaw and J. Banks. Security and other aspects of the distribution of governmental technical reports, by R. R. Bray. Part IV, Filing: Filing the technical report in industry and government, by M. Terry and J. F. Smith. Subject classifying and alphabetical indexing of technical reports, by L. R. Poland. Report indexing of hand-sorted punched cards, by S. W. Dunwiddie and C. C. Conrad. The Uniterm coordinate indexing of reports, by M. Taube and associates. Cataloguing government technical reports, by B. M. Fry. Records and control procedures for security-classified technical reports, by B. M. Fry. The storage and housing of unpublished technical reports, by S. Herner. Abstracting technical reports, by L. C. Stark and E. C. Crosman. Part V, Using: Putting technical-report files to work, by L. R. Poland. How to locate and obtain government information reports, by F. L. Brown. Use of industry-survey reports as a chemical-market-research tool, by H. E. Bode. Appendices. Report manual of the Georgia Tech Engineering Experiment Station. Executive order 10501—safeguarding official information in the interest of the defense of the United States. Author index. Subject index.

Note: A book designed to aid in solving some of the problems created by the rise of the technical report as a primary medium of communication in science and engineering, particularly at the research level. The authors are directors of research, college teachers

of technical writing, librarians and specialists in other fields. Problems in writing and editing, circulating, abstracting, indexing, even storing of such reports are discussed and various solutions are described. The book contains many useful ideas, however it is written from too many diverse viewpoints and contains too much elementary and obvious material for a definitive monograph.

ZIMMERMAN, OSWALD THEODORE, AND IRVIN LAVINE

Industrial Research Service's handbook of *material trade names 1953 edition.* Dover, N H Industrial Research Service, 1953 794 p illus 28 cm. $20 00 5206

Note. A revised, enlarged and in every way much improved second edition of the 1946 book of the same title. It now contains approximately 15,000 trade names in all fields, as compared to 5,000 in the first edition. Properties and uses, as well as the manufacturers or distributors of each product, are identified. Symbols have been introduced to distinguish the registered and unregistered trade names, generic and common names. A new feature, the "Classification section," provides a classified approach which is supplemented by an expanded directory of producers and their products. An essential reference book for the technical library and for the desks of engineers, manufacturers and purchasing agents who are concerned with the identification and purchase of trade-named products. Supplement 1 was published in 1957 378 p., $13.50.

ZIMMERMAN, OSWALD THEODORE, AND IRVIN LAVINE

Scientific and technical abbreviations, signs and symbols Second edition *Dover, N H. Industrial Research Service, 1949 541 p.* illus. 22 cm. $8 00 5207

Contents General list of abbreviations and symbols. Greek alphabet, numerical prefixes, metric abbreviations, mathematics, and statistics. Chemistry chemical engineering, physics, thermodynamics, heat flow humidity and radiation. Mechanics, hydraulics, acoustics, and illumination. Mechanical drawings, materials of construction, and shop terms. Electricity electronics, and magnetics. Mapping. Railway Aeronautics and aviation. Communications. Meteorology Military Medicine, botany and zoology Commerce Astronomy Latin expressions, states, punctuation, and proof reading. Technical journals. Index.

Note A reference handbook of standard and accepted abbreviations and symbols. The first section consists of about 7,000 terms alphabetically arranged and followed by their recommended abbreviations or signs. The sections devoted to special fields contain standard abbreviations and symbols, such as those adopted by the American Standards Association and, in addition, other abbreviations commonly employed in the particular field. The scope and even the format of the book are essentially unchanged in this second edition. There has been some rearrangement of material. Some of the tables have been expanded and seven new ones added.

MATHEMATICS FOR ENGINEERS

ADAMS DOUGLAS PAYNE, compiler

An index of nomograms. New York John Wiley & Sons Inc., 1950 174 p 25 cm. $4 50 5208

Contents Index A, Key words. Index B, Master list Mathematics. Physics. Chemical engineering and chemistry Electricity electronics, radio. Hydraulics and power Waterworks and sewerage. Oil and gas and by-products. Illumination. Aeronautics. Heating, piping, ventilating, air conditioning, insulation, refrigeration. Building, structures, surveying, soils, cement. Highways, railroads, trucking. Machine design. Machine tools. Welding, foundry sheet metal. Metals. Mining. Paper Textile. Medicine. Food.

Note. Useful nomograms are published from time to time in technical periodicals, here many of them have been buried heretofore, because the persons who could have put them to use did not know of them or lacked time t ferret them out. This book locates more than 1,100 such nomograms which have appeared in 97 scientific and technical periodicals. The index to key words is essentially title index. The other and main index is classified one.

BECKENBACH, EDWIN F , editor

Modern mathematics for the engineer New York McGraw Hill Book Company, Inc., 1956 514 p illus. 23 cm $7 50 5209

Contents Part I, Mathematical models: Linear and non-linear oscillations, by S. Lefschetz. Equilibrium analysis—the stability theory of Poincaré and Liapunov by R. Bellman. Exterior ballistics, by J W Green. Elements of the calculus of variations, by M. R. Hestenes. Hyperbolic partial differential equations and applications, by R. Courant. Boundary value problems in elliptic partial differential equations, by M. M. Schiffer The electrostatic boundary-value problems, by I. S. Sokolnikoff. Part II, Probabilistic problems: The theory of prediction, by N Wiener The theory of games, by H. F Bohnenblust. Applied mathematics in operations research, G. W King. The theory of dynamic programming, by R. Bellman. Monte Carlo methods, by G. W Brown. Part III, Computational considerations Matrices in engineering, by L. A. Pipes. Functional transformations for engineering design, by J L. Barnes. Conformal mapping methods, by E. F Beckenbach. Nonlinear methods, by C. B. Morrey jr. What are relaxation methods? by G. E. Forsythe. Methods of steep descent, by C. B. Tompkins. High-speed computing devices and their applications, by D. H. Lehmer Name index. Subject index.

Note The contents of this book were delivered first as lectures in an extension course offered at the University of California. The course was planned to "generate in the minds of engineers and applied scientists engaged in research, design, and administration an awareness of the recent rapid advancement in applied mathematical thought. Eminent mathematicians and engineers prepared and delivered the lectures, and each spoke in the spirit of explaining important and useful ideas and techniques to receptive audience. There is emphasis on solution of problems involving probability on numerical techniques and on high-speed computers. The various chapters include selected references to the literature. The book is a companion volume to L. N Ridenour ed., *Modern physics for the engineer* New York, 1954.

BORG, SIDNEY F

An introduction to matrix tensor methods in theoretical and applied mechanics. Ann Arbor, Michigan J W Edwards Publisher, Inc., 1956 202 p. illus 28 cm $4 75 5210

Contents Mathematical preliminaries. Tensors (or matrices) of zero, first and second order Introduction to theory of elasticity Applications of the theory of elasticity Introduction to the theory of plates and shells. The equations of viscous flow and introduction to boundary layer theory Introductory theory of plasticity Curvilinear coordinates. Tensor analysis as related to dimensional analysis. Index.

Note A textbook designed for the instruction of senior undergraduate and graduate students of engineering and applied physics. It is an introduction to matrix and tensor techniques useful in various fields of applied physics and engineering and is organized so as to give broad, unified view of matrix-tensor approaches to problems in applied mechanics. The first chapter is taken largely from paper contributed by the author to the February 1951 issue of the *American journal* / *physics*. The author is head of the Department of Civil Engineering of Stevens Institute of Technology

BURINGTON, RICHARD STEVENS, AND CHARLES CHAPMAN TORRANCE

Higher mathematics, with applications to science and engineering New York Mc Graw Hill Book Company Inc. 1939 844 p. illus. 23 cm. $10 00. 5211

Contents (abridged) Differential calculus Elementary review Partial differentiation. Integral calculus. Indefinite integrals. Definite integrals. Riemann theory of integration. Improper integrals. Integrals containing parameter Special functions defined by means of definite integrals. Numerical integration. Ordinary differential equations Elementary types. Linear equations. Singular solutions. Electrical networks. Numerical solution. Legendre and Bessel's equations. Infinite sequences and series Power series. Other topics. Sequences of functions. Fourier series. Orthogonal functions. Functions of complex variable Complex numbers. Complex integral calculus. Singularities of single-valued analytic functions. Conformal mapping. Applications. Elliptic functions. Algebra and vector analysis Some differential geometry Tensor analysis. Partial differential

equations. Calculus of variations. Dynamics. Introduction to real variable theory. Bibliography. Index.

Note: Designed primarily to meet the growing needs of readers interested in the applications of mathematics to physics and engineering, the book emphasizes physical meanings of the various notions and relationships encountered in higher mathematics. In order that the treatment may be suited to the student of pure mathematics, emphasis has been placed upon the conditions which must be met for a given theorem or formula to be valid.

BURR, IRVING W

Engineering statistics and quality control New York. McGraw Hill Book Company 1953. 442 p. illus. 24 cm. $7.50 5212

Contents: Introduction. The frequency distribution—a tool and concept. A few fundamental statistical measures. The normal curve. Control charts in general. Control charts for measurements. Probability. Control charts for attributes. Miscellaneous topics in control charts. Putting control charts to work. Acceptance sampling for attributes. Some standard plans for attributes. Some plans for acceptance sampling by measurements. Putting statistical methods to work. Appendix: Glossary. Tables. Index.

Note: Essentially this book is an introduction to applied statistics addressed to engineering students. The applications of statistical techniques to the quality control of manufactured products is emphasized, but the book is not limited to quality control. It is a work of interest to scientists and technicians in any field where statistical methods may be applied to the analysis of data. It is distinguished by skillful interweaving of theory and applications and by a style that reads easily. Selected literature references are included. The author is Professor of Mathematics, Purdue University.

BUSH VANNEVAR

Operational circuit analysis. With an appendix by Norbert Wiener New York John Wiley & Sons, Inc., 1929 392 p. illus. 20 cm. $7.50. 5213

Contents: The circuits of engineering and physics. The fundamental equations of circuit analysis. The impedance function. The indicial admittance. The superposition theorem. The infinite integral theorem. The Heaviside expansion theorem. The direct operational method. Functions of a complex variable. The Fourier integral formulation. Fractional-order derivatives. Series expansions of operators. Operators involving [illegible]. Special circuit problems and analysis. Networks with variable parameters. Appendixes: Table of symbols. Fourier analysis and asymptotic series. Table of operational formulas. Index.

Note: This textbook still holds its place as a useful, well-organized introduction to the operational methods of Oliver Heaviside. It is written from the engineering viewpoint and is designed to prepare the reader for the use of the operational method in all kinds of circuit problems.

CHURCHILL, RUEL VANCE

Modern operational mathematics in engineering. New York McGraw Hill Book Company Inc., 1944 306 p illus. 21 cm. $5.25 5214

Contents: The Laplace transformation. Further properties of the transformation. Elementary applications. Problems in partial differential equations. Functions of a complex variable. The inversion integral. Problems in heat conduction. Problems in mechanical vibrations. Sturm-Liouville systems. Fourier transforms. Appendixes. Index.

Note: A college text dealing with the use of the Laplace transformation in the solution of engineering and physics problems involving partial differential equations. A bibliography and tables are given in the appendixes. No previous preparation in the subject of partial differential equations is required of the student, and a year of college physics is considered sufficient background for the physical and engineering problems encountered in the text. The work is a companion volume to the author's *Fourier series and boundary value problems*, New York, 1941.

CRANDALL, STEPHEN H.

Engineering analysis a survey of numerical procedures. New York McGraw Hill Book Company Inc. 1956 417 p. illus. 24 cm (Engineering Societies monographs Ralph H. Phelps, consulting editor) $9.50 5215

Contents: Equilibrium problems in systems with finite number of degrees of freedom. Eigenvalue problems for systems with finite number of degrees of freedom. Propagation problems in systems with finite number of degrees of freedom. Equilibrium problems in continuous systems. Eigenvalue problems in continuous systems. Propagation problems in continuous systems. Bibliography. Name index. Subject index.

Note: A college text of more than the usual significance. It deals with the construction of mathematical models for physical situations encountered in engineering and reduction of the mathematics to forms that can be solved by numerical techniques. The latter step is important because it enables the computation of the solutions on high-speed computers when the problem is a complex one. The unusual organization of the book is apparent from the chapter titles listed above. The treatment is at the graduate level. The book is designed for use in organized courses and is suitable also for study outside of such courses by graduate engineers. The author is Associate Professor of Mathematics at the Massachusetts Institute of Technology.

DAVIS DALE S

Nomography and empirical equations. New York Reinhold Publishing Corporation 1955 236 p. illus. 24 cm. $6 75 5216

Contents: Part I, Empirical equations: Common linear, logarithmic, and semilogarithmic forms. Two-variable correlation—less common forms. Two-variable correlation—special methods. Three-variable correlation. Part II, Nomography: Addition charts. Logarithmic charts. Nonlogarithmic multiplication charts. Reciprocal variable charts. Combination charts. Line coordinate charts. Graphical anamorphosis. Appendix. Index.

Note: A successor to the author's *Empirical equations and nomography*, New York, 1943. Since publication of the first edition, the book has been widely used, both for the instruction of engineering students and as a refresher and reference book for working engineers. The scope is unchanged in this new edition. However, numerous useful changes have been made, changes designed to facilitate understanding of the book and to enhance its usefulness. The quantity of matter in the book has been substantially increased; however, a considerable fraction of the increase is due to the inclusion of more problems for the reader to solve.

DULL RAYMOND WILLIAM

Mathematics for engineers. Revised and edited by Richard Dull. Third edition. New York McGraw Hill Book Company Inc., 1951 822 p illus. 21 cm. $9.00. 5217

Contents (abridged): Functions and graphs and the statement of problems in the form of equations. Linear or first-degree equations. Analytical and graphical solutions. Quadratic or second-degree equations. Explicit functions. Analytical and graphical solutions. Cubic functions. Polynomial functions. Power functions. Progressions. Variables, limits, and indeterminate forms. Exponential functions and their relation to logarithmic functions. Infinite series. Determinants. Permutations and combinations. Geometry and mensuration. Trigonometric functions. Polar coordinates. Vectors. Imaginary and complex numbers. Hyperbolic functions. Simple application of coordinates. Linear equations. Second-degree equations. Conics. The parabola. The circle and the ellipse. The hyperbola. Parametric and polar equations. Empirical equations. Application of coordinates to geometry of three dimensions. Linear equations in three variables. Differential calculus. Differentiation of logarithmic and exponential functions. Curve analyses. Integral calculus. The definite integral. Reduction methods for integration. Summation method. Differential equations. Dimensional and similarity analysis. Index.

Note. This volume is intended to serve practicing engineers as a quick reference manual, or as a text for reviewing or expanding their mathematical knowledge. The form and scope of presentation lie between the conciseness of the engineering handbook and the tutorial style of the mathematical textbook. Changes made in this edition include a new chapter on differential equations and an expansion of the sections on infinite series, determinants, complex vectors, and trigonometric functions.

FRANKLIN, PHILIP

Differential equations for electrical engineers. New York John Wiley & Sons, Inc., 1933 299 p. illus 22 cm. $4 50 5218

Contents. Complex numbers. Average values and Fourier series. Linear differential equations with constant coefficients. Partial derivatives and partial differential equations. The physical meaning of certain partial differential equations. Solutions of partial differential equations satisfying given boundary values. Analytic functions. Convergence of Fourier series. Bibliography Index.

Note. A textbook which treats the problems of current flow determination in networks with lumped constants, the geometric and physical meaning of partial derivatives and partial differential equations, and theory of power series and Fourier series. Practical applications are stressed in examples and problems.

FRY, THORNTON C

Probability and its engineering uses. Princeton D Van Nostrand Company, Inc., 1928 476 p illus 24 cm. $7 75 5219

Contents Introduction. Permutations and combinations. Elementary principles of the theory of probability Probability and experiment; Bernoulli's theorem. Probability and experiment; Bayes theorem. Distribution functions and continuous variables. Averages. The distribution functions most frequently used in engineering. Curve fitting. The theory of probability as applied to problems of congestion. Fluctuation phenomena in physics. Appendices. Index.

Note. Developed from notes prepared for a course sponsored by the Bell Telephone Laboratories and given to graduate engineers on its staff, this book is a very successful exposition of probability from the viewpoint of the engineer Without being superficial, the author has succeeded in making the subject clear and in indicating meaningful implications for engineering. The organization and style of the book are such that persons with adequate education in basic mathematics can understand it without the guidance of an instructor The first edition was published in 1928, and it has been reprinted many times without revision.

GRINTER, LINTON ELIAS, editor

Numerical methods of analysis in engineering (successive corrections) A publication resulting from a symposium held at Illinois Institute of Technology, Chicago, Illinois, arranged and edited by L E Grinter New York The Macmillan Company, 1949 207 p illus 24 cm $6 00 5220

Contents I, Numerical methods based upon physical concepts Analysis of continuous frames by distributing fixed-end moments, by H. Cross. Statistical state of stress studied by grid analysis, by L. E. Grinter Appendix—Notched beam solution by grid analogy by A. J Pyle. II, Numerical solutions of equations for state of stress. Numerical solutions of boundary value problems by relaxation methods, by F S. Shaw The quest for accuracy in computations using finite differences, by R. V Southwell. A new approach to the numerical solution of Laplace's equation, by M. M. Frocht. III, Applications of numerical methods to heat transfer Numerical solutions for thermal systems, by L. M. K. Boelter and M. Tribus. Two problems in building heating solved numerically by G. M. Dusinberre. Appendix—Temperature distribution through ground, by J. D. Bottorf and Y S. Touloukian. IV Surveys and bibliographies of numerical methods Successive corrections—a pattern of thought, by F Baron. Numerical methods of analysis of bars, plates and elastic bodies, by N M. Newmark. A survey of the approximate solution of two-dimensional physical problems by variational methods and finite difference procedures, by T J Higgins. Author index. Subject index.

Note. The first paper in this volume, written by Hardy Cross and reprinted here from the *Proceedings* of the American Society of Civil Engineers, was the starting point for extensive investigation of the use of numerical methods of analysis in arriving at satisfactory approximations in engineering problems that could not be solved exactly Most of the remaining papers are not reprints but are published here for the first time. They are of interest to graduate students and to graduates engaged in research and engineering design. Substantial bibliographies accompany the papers.

HEACOCK, FRANK A.

Graphic methods for solving problems. Princeton Princeton University Store, 1952 113 p 28 cm $1 90 5221

Contents Simple graphs and charts. The hydrograph. Geometric diagrams. Network charts. Vectors and mechanics. Descriptive geometry Nomographs and computing devices. Graphic analysis. General bibliography Index.

Note. Primarily this book is an annotated, bibliographical guide to the articles and books on graphic methods that have been published from 1937 through 1950. However each of the chapters begins with a section in which a particular type of graphic device or method is carefully defined and illustrated. The main emphasis is on engineering uses of graphic methods, but some material is included on pictorial charts and other devices that are used in a number of fields. The book is a development of research undertaken for a committee of the American Society for Engineering Education.

JOHNSON, WALTER C

Mathematical and physical principles of engineering analysis. New York McGraw Hill Book Company, Inc., 1944 346 p. illus. 21 cm. $6 25 5222

Contents. The analysis of engineering problems. Some basic physical principles. Transient and steady-state conditions. Setting up equations. Graphical and numerical solution of differential equations. Ordinary and differential equations. Vector representation of sinusoids. The checking of equations. Dimensional analysis. Fourier series. Systems with distributed constants. Index.

Note Presents the essential physical and mathematical principles and methods of attack that underlie the analysis of many practical engineering problems. Emphasis is placed upon physical concepts, the use of assumptions, procedures in setting up equations, the use of mathematics as a tool in accurate and quantitative reasoning, and the physical interpretation of mathematical results.

JONES, OSCAR BERNARD

Applied industrial mathematics. New York Prentice-Hall, Inc. 1947 342 p. illus. 24 cm. $4 25 5223

Contents (abridged) The origin of mathematics. Division and its application. Factoring and cancellation. Signs and symbols. Fractions and mechanical advantage. Decimals, percentages, and arithmetical averages. Involution and evolution. Cube root. Ratio and proportion. Pulley and gear ratios. Tapers. Elementary algebraic equations. Polynomials. Equations and graphs. Exponents and logarithms. Binomial theorem and algebraic factoring. Quadratic equations. Elements of geometry Ellipses. Summary of theorems and axioms. Pyramids and cones. Spheres. Solids of revolution—blank diameters. Spur gears—center of gravity Trigonometric functions. Compound angles. Index.

Note An elementary text designed for the use of students in technical and vocational schools and for home study purposes by mechanical draftsmen, designers, and tool and die makers. The methods of applying arithmetic, algebra, geometry logarithms, and trigonometry to the solution of machine shop problems are preceded by brief review of the mathematical concepts and operations involved. Worked examples and review problems are included in each chapter.

KÁRMÁN, THEODOR VON, AND MAURICE A. BIOT

Mathematical methods in engineering an introduction to the mathematical treatment of engineering problems New York McGraw Hill Book Company Inc., 1940 505 p. illus 23 cm. $7 50 5224

Contents Introduction to ordinary differential equations. Some information on Bessel functions. Fundamental concepts of dynamics. Elementary problems in dynamics. Small oscillations of conservative systems. Small oscillations of nonconservative systems. The differential equations of the theory of structures. Fourier series applied to structural problems. Complex representation of periodic phenomena. Transient phenomena. Operational calculus. Equations with finite differences applied to engineering. Words and phrases. Answers. Index.

Note The object of this book is to familiarize engineering students with the special techniques used in the mathematical treatment of engineering problems. Necessary tools beyond elementary calculus are taught in direct connection with practical problems from the field of mechanical, civil, and electrical engineering.

LANGHAAR, HENRY LOUIS

Dimensional analysis and theory of models. New York. John Wiley & Sons Inc., 1951 166 p. illus. 23 cm. $6.00. 5225

Contents The nature and the use of dimensions. Principles and fundamentals of dimensional analysis. Systematic calculation of dimensionless products. Algebraic theory of dimensional analysis. Similarity and model testing. Dimensional analysis applied to problems of stress and strain. Some applications of dimensional analysis in fluid mechanics. Dimensional analysis applied to the theory of heat. Dimensional treatment of problems of electromagnetic theory. Differential equations and similarity. Answers to problems. Index.

Note Dimensional analysis is a set of mathematical techniques whereby the number of variables in a given problem may be reduced in order to obtain useful partial solutions. It has special application to the design and predictions of performance of full-scale machines from data obtained in experiments with small models. The book also contains discussions of applications of dimensional analysis to fields of engineering in which it is not practical or customary to use models in design work. The author is Professor of Theoretical and Applied Mechanics at the University of Illinois.

LAWDEN DEREK F

Mathematics of engineering systems (linear and non-linear) New York John Wiley & Sons, Inc., 1954 380 p. illus. 23 cm. $5 75 5226

Contents Introduction. Linear differential equations with constant coefficients (classical methods). Linear differential equations with constant coefficients (operator methods). Fourier analysis. Non-linear differential equations. Appendix of Laplace transforms. Solutions to exercises. Index.

Note This book is an introduction to a number of mathematical techniques based on differential equations which are useful in the analysis of mechanical and electrical systems encountered in engineering design. It is intended for use as a text by engineering students and as a refresher by graduate engineers. Linear differential equations and Fourier analysis are treated at some length. Although the chapter on non-linear differential equations is about 70 pages long, it is only an introduction to this area which is of so much importance in present-day engineering analysis. Numerous worked examples are included and answers are given for the problems included for the student to solve.

MICHAL ARISTOTLE D

Matrix and tensor calculus with applications to mechanics, elasticity and aeronautics. New York John Wiley & Sons, Inc., 1947 132 p. illus. 23 cm. (Galcit aeronautical series) $4 75 5227

Contents Part I, Matrix calculus and its applications: Algebraic preliminaries. Differential and integral calculus of matrices. Matrix methods in problems of small oscillations. Matrix methods in the mathematical theory of aircraft flutter. Matrix methods in elastic deformation theory. Part II, Tensor calculus and its applications: Space line element in curvilinear coordinates. Vector fields, tensor fields, and Euclidean Christoffel symbols. Tensor analysis. Laplace equation, wave equation, and Poisson equation in curvilinear coordinates. Some elementary applications of the tensor calculus to hydrodynamics. Applications of the tensor calculus to elasticity theory. Homogeneous and isotropic strains, strain invariants, and variation of strain tensor. Stress tensor, elastic potential, and stress-strain relations. Tensor calculus in Riemannian spaces and the fundamentals of classical mechanics. Applications of the tensor calculus to boundary-layer theory. Notes on Part I. Notes on Part II. References for Part I. References for Part II. Index.

Note The purpose of this volume is to provide the research engineer with a working knowledge of the matrix and tensor calculus. The author has stressed the practical aspects of the subject as utilized in the fields of physics, meteorology, electrical engineering, mechanical engineering, and aeronautical engineering.

MILLER, KENNETH S

Engineering mathematics. New York Rinehart & Company Inc. 1956 417 p. illus. 23 cm. $6.50 5228

Contents Determinants and matrices. Integrals. Linear differential equations. Fourier series and integrals. Laplace transform. Network theory. Random functions. Appendices. Answers. Index.

Note A well-co-ordinated textbook designed primarily for study by first-year graduate students of engineering. As the chapter titles indicate, some techniques are introduced which were not usually included in first-year graduate texts of a few years ago. A particular example is the final chapter on random functions. The author is Associate Professor of Mathematics in New York University.

MINORSKY NICHOLAS

Introduction to non linear mechanics Topological methods, analytical methods, non linear resonance relaxation oscillations. Ann Arbor J W Edwards 1947 447 p. illus. $6.00 5229

Contents Part I, Topological methods of non-linear mechanics: Phase trajectories of linear systems. Phase trajectories of non-linear conservative systems. Questions of stability. Limit cycles of Poincaré. Bifurcation theory (Poincaré). Geometrical analysis of existence of periodic solutions. Cylindrical phase space. Part II, Analytical methods of non-linear mechanics: Introductory remarks. Method of Poincaré. Method of Van der Pol. Theory of the first approximation of Kryloff and Bogoliuboff. Approximations of higher orders. Method of equivalent linearization of Kryloff and Bogoliuboff. References. Part III, Non-linear resonance: Introductory remarks. Systems with several degrees of freedom. Subharmonics and frequency demultiplication. External periodic excitation of quasi-linear systems. Non-linear external resonance. Subharmonic resonance on the basis of the theory of Poincaré. Entrainment of frequency. Parametric excitation. References. Part IV, Relaxation oscillations: Introductory remarks. Fundamentals of the discontinuous theory of relaxation oscillations. Degenerate systems with one degree of freedom. Multiply degenerate systems. Mechanical relaxation oscillations. Oscillations maintained by periodic impulses. Effect of periodic parameters on stationary states of dynamical systems. References. Index.

Note Linear differential equations are much used in computations in engineering, especially in problems concerning oscillation and resonance. However linear methods fail to give accurate results in many cases, because the assumptions or idealizations that must be made are not valid. This work is an introduction to certain useful mathematical methods that may be used for more accurate results in such cases. It was issued originally as restricted reports for the use of authorized personnel during World War II.

MURNAGHAN FRANCIS DOMINIC

Introduction to applied mathematics. New York John Wiley & Sons, Inc., 1948. 389 p. illus. 24 cm. (Applied mathematics series edited by I S Sokolnikoff) $7 00 5230

Contents Vectors and matrices. Linear vector functions. Functions-vectors. Fourier series. Curvilinear coordinates. Laplace's equation. Spherical harmonics and Bessel functions. Boundary-value problems. Integral equations. The calculus of variations. The operational calculus. Index.

Note Some of the fundamental concepts of higher mathematics that are finding wide application in present-day science and engineering are discussed in this text. The work is based on a course for graduate students that was given for 20 years by the author at the Johns Hopkins University and is intended for use in similar courses.

MURPHY GLENN

Similitude in engineering. New York The Ronald Press Company 1950 302 p. illus. 24 cm. $7.00 5231

Contents (abridged) Part I, Theory of similitude and its application to models: Observations and measurements. Dimensional analysis. Development of prediction equations. Theory of models. Structural models. Part II, Distorted models: Analysis. Distorted structural models. Fluid flow models. Thermal models. Electrical and magnetic models. Acoustical and illumination models. Applications of model

theory to chemical engineering. Part III, Dissimilar models: Analogies from second-order ordinary differential equations. Analogies from second-order partial differential equations. Analogies from fourth-order differential equations. Analogies from four-term algebraic equations. Author index. Subject index. Tables: Critera for rejection of observations. Average values of properties of a few solids. Average values of properties of a few fluids. Prediction factors for stress and deflection. Value of *N* in Bazin formula.

Note. This book deals with the design of engineering models and the interpretation of the results obtained in experiments ith them. It is intended for use chiefly as a college textbook, and the chapters conclude with problems to be solved and, in some cases, with out lines of laboratory experiments. Worked problems, some of which require the use of laboratory equipment, are incorporated in the discussions. Familiarity with basic mechanics and with the handling of differential equations has been assumed in the treatment.

Oldenburger, Rufus

Mathematical engineering analysis. New York The Macmillan Company, 1950 426 p illus 24 cm. $8 00 5232

Contents (abridged) Fundamentals of the mechanics of particles and rigid bodies. Applications and further development of the theory of the mechanics of rigid bodies. Fundamentals of electricity and magnetism. Electric systems. Electromagnetic fields. First law of thermodynamics. Second law of thermodynamics. Heat transfer Fundamental theory of elasticity Elasticity for one and two dimensions. Elasticity in three dimensions. Fundamental fluid theory Compressible fluids. Aerodynamics.

Note Not a text in mathematics but one in utilizing mathematics in the solution of research problems in engineering. Its purpose is to show advanced engineering and science students who are preparing for industrial research how to set up physical problems so that they can be solved mathematically The author has assumed that his readers will have knowledge of advanced calculus. Scores of specific engineering examples are used in the exposition. These have such titles as "Automobile with shock absorbers and elastic tires, "Rocket moving in two-dimensional space, "Diesel engine driving marine propeller through long shaft, and "Flow past an airplane wing.

Pipes, Louis Albert

Applied mathematics for engineers and physicists New York McGraw Hill Book Company, Inc., 1946 618 p illus. 23 cm. $7 50 5233

Contents. Infinite series. Complex numbers. Mathematical representation of periodic phenomena, Fourier series and the Fourier integral. Linear algebraic equations, determinants, and matrices. The solution of transcendental and polynomial equations. Linear differential equations with constant coefficients. Laplacian transforms of use in the solution of differential equations. Oscillations of linear lumped electrical circuits. Elastic vibrations of systems with a finite number of degrees of freedom. The differential equations of the theory of structures. The calculus of finite differences and linear difference equations with constant coefficients. Partial differentiation. The gamma, beta, and error functions. Bessel functions. Legendre's differential equation and Legendre polynomials. Vector analysis. The wa equation. Simple solutions of Laplace's differential equation. The equation of heat conduction or diffusion. The elements f the theory of the complex variable. The solution of two-dimensional potential problems by the method of conjugate functions. The operational calculus. The analyses of nonlinear oscillatory systems. Index.

Note A classroom textbook which is also useful to practicing engineers as handy review It discusses many of the more useful topics from advanced mathematics and explains their applications to the solution of problems in engineering and applied physics. It is based on course formerly given by the uthor in the Harvard Graduate School of Engineering. Since the author's main purpose was to demonstrate the use of mathematics, he has not always included proofs, but he has included references to publications in which proofs will be found. A group of problems accompanies each chapter

Reddick, H. W and F H Miller

Advanced mathematics for engineers. Third edition prepared by F H. Miller New York John Wiley & Sons Inc. 1955 548 p 22 cm $6 50 5234

Content Ordinary differential equations. Hyperbolic functions. Elliptic integrals. Infinite series. Fourier series. Gamma, Bessel, and Legendre functions. Partial derivatives and partial differential equations. Vector analysis. Probability and numerical methods. Functions of complex variable. Operational calculus. Appendix Answers to problems. Index.

Note This book has been developed from courses in applied mathematics given to civil, electrical, mechanical, and chemical engineering students at the Cooper Union Institute of Technology. Its mathematical scope is apparent from the chapter titles listed above. In all of the chapters the mathematical concepts and techniques are the primary subject and their applications in engineering are secondary Nevertheless, the applications are the reason for the existence of the book. The second edition was published in 1947 The major change in this third edition is substantial increase in the number of problems. However revisions and changes ha been made in various chapters, and the longer chapter on probability has been rewritten and retitled. Professor Miller who prepared this third edition, is Head of the Department of Mathematics in the School of Engineering of Cooper Union.

Rice, Harold S, and Raymond M Knight

Technical mathematics. New York Mc Graw Hill Book Company, Inc., 1954 748 p illus. 24 cm $6 50 5235

Contents (abridged) Unit one, Slide rule and review of arithmetic and geometry: Treatment of measured data. The slide rule. Unit two, Basic algebra: Linear equations in one unknown. Unit three, Advanced algebra and logarithms; Functions and graphs. Systems of linear equations. Quadratic equations in one unknown. The binomial theorem—progressions. Exponential functions—rate of growth. Unit four Introduction to analytical trigonometry Unit five, Numerical trigonometry of the right triangle. Unit six, Oblique triangles and applications of numerical trigonometry Unit seven, Analytical trigonometry: Vectors. Graphs of the trigonometric functions. Complex notation and vector algebra. Appendixes: Computation aids and approximations. Formulas of geometry and mensuration. Solution of higher-degree equations. Tables. Index.

Note. More ground is covered in this book than in many of the "practical texts in mathematics. Also, some of the topics covered, for instance vector algebra, are more advanced in level. The authors have assumed that the students and readers who use the book will have had one or two years of high-school algebra, nevertheless, there is chapter in which elementary algebra is reviewed. The book was developed at Wentworth Institute in courses offered to students preparing for industrial positions in which some familiarity ith elementary engineering mathematics is required. Accordingly there is considerable emphasis on the use of the slide rule and on the use of graphs in computation and in setting up equations. Another feature is an unusually large number of exercises and problems for the student to ork.

Salvadori, Mario George, and Ralph J Schwarz

Differential equations in engineering problems. New York Prentice-Hall, 1954 432 p. illus. 23 cm $8 65 5236

Contents Introduction. Setting up ordinary differential equations. Homogeneous linear differential equations with constant coefficients. Nonhomogeneous linear differential equations. The Laplace transform and initial value problems. Simultaneous linear differential equations. Integration by series. Bessel functions. Nonlinear differential equations and elliptic integrals. Solution of differential equations by Fourier series. Partial differential equations. Index.

Note An engineering college textbook in which differential equations are treated entirely from the engineering viewpoint. Applications in engineering are illustrated both in the expository text and in the problems. Completion of introductory college courses in calculus and algebra are prerequisites. The authors are members of the Engineering Faculty of Columbia University and the book has been developed in courses given there.

Salvadori, Mario George

The mathematical solution of engineering problems with a collection of problems by Kenneth S Miller New York Columbia University Press 1948 245 p. illus. 23 cm. $4 25 5237

Contents: Introduction. A review of some basic mathematical concepts. Plane analytic geometry. The numerical solution of algebraic and transcendental equations. The numerical solution of simultaneous linear algebraic equations. Elementary functions and power series. Fourier series expansion and harmonic analysis. Answers to [illegible] problems. Index.

Note: An elementary textbook in engineering mathematics. The first chapter is definitely a refresher on such concepts as variables and functions, [illegible] of [illegible] variables, continuity, differentials, and integrals, since the author has assumed on the part of the reader knowledge of mathematics through calculus. In the other chapters, concepts and techniques of theoretical mathematics are related to the solving of practical engineering problems. Numerous illustrative examples are incorporated into the textual material, and over 1,000 practical problems constitute an important part of the exposition. The author is Professor of Civil Engineering in Columbia University. The book was first published by the McGraw-Hill Book Company in 1946.

SALVADORI, MARIO GEORGE

Numerical methods in engineering. With a collection of problems by Melvin L. Baron. New York, Prentice-Hall, Inc., 1952. 258 p. illus. 21 cm. (Prentice-Hall civil engineering and engineering mechanics series. N. M. Newmark, editor) $5.75 5238

Contents: The practical solution of algebraic and transcendental equations. Finite differences and their applications. The numerical integration of initial value problems. The numerical integration of ordinary boundary value problems. The numerical solution of partial differential equations. Index.

Note: A useful introduction, which is designed both for college seniors and for graduate engineers. The numerical methods described are especially adapted to use on electric calculating machines of the desk type and on slide rules. The book contains concise but clear explanations of many useful numerical methods, such as Graeffe's root-squaring scheme, Cholesky's matrix method, the relaxation method, the trapezoidal rule for numerical integration, Fox's methods for second order linear equations, and Simpson's one-third rule. The author is Professor of Civil Engineering in Columbia University.

SCHELKUNOFF, SERGEI ALEXANDER

Applied mathematics for engineers and scientists. New York, D. Van Nostrand Company, Inc., 1948. 472 p. illus. 24 cm. (The Bell Telephone Laboratories series) $9.50 5239

Contents: Complex numbers. Theory of approximations. Solution of equations. Power series. Differentiation. Integration. Vector analysis. Coordinate systems. Exponential functions. Differential equations of the first order. Differential equations of the second order. Differential equations of higher order. Partial differential equations. Conformal transformations. Contour integration. Fourier analysis. The gamma function. Exponential integrals. Fresnel integrals. Bessel functions. Legendre functions. Formulation of equations. References. Index.

Note: As engineering advances, so do the demands upon the mathematical knowledge of engineers. This book deals with certain advanced mathematical concepts and procedures whose usefulness in several fields of mathematical physics or engineering have already been demonstrated, even though they are not part of the mathematical equipment of the average graduate physicist or engineer. Concepts of limited usefulness or so far applied only to highly specialized fields have not been included. The author is a member of the technical staff of the Bell Telephone Laboratories.

SIMON, LESLIE EARL

An engineers' manual of statistical methods. New York, John Wiley & Sons, Inc., 1941. 231 p. illus. 25 cm. $5.75 5240

Contents: Making sense out of figures. Inspection of [illegible] lots by attributes. Inspection of isolated lots by attributes. Process inspection by attributes. Inspection of [illegible] lots by variables. Inspection of isolated lots by variables. Process inspection by variables. The special case of [illegible] sample size. A method of expressing quality. Sample size. Significant differences. Miscellaneous statistical techniques. Predicting from sample to lot. The incomplete beta-function ratio. Sampling quality control system. Specifications and standards of quality. Literature cited. Glossary of symbols. Index.

Note: A summary of certain working parts of the sciences of probability, statistics, and logic, designed for the practical man whose interest is centered in his industrial or engineering work. The principles relating to inspection methods and statistical inference are predicated on recognized standard procedures or on research conducted at the Ballistic Research Laboratory, Aberdeen Proving Ground, in connection with the designing of an inspection procedure for the Army Ordnance.

SMOLEY, C. K.

Smoley's four combined tables for engineers, architects and students. By C. K. Smoley, extended by E. R. Smoley and N. G. Smoley. Chautauqua, N. Y., C. K. Smoley & Sons, Inc., 1956. 4 v. in 1. 18 cm. $12.00. 5241

Note: Combined, for the convenience of users, in this reference manual are four independent books of tables. There is a combined title page, from which the title given above has been taken, and four title pages for the individual compendia. Titles and paginations of the individual works are as follows: Smoley, *Parallel tables of logarithms and squares*, 661 pages; Smoley, *Parallel tables of slopes and rises for bridge and structural engineers, draftsmen, checkers, template makers, bender and vocational schools*, 190 (actually 433) pages; Smoley, *Five decimal logarithmic trigonometric tables, natural trigonometric functions including secant and cosecant, squares, cubes, square roots, etc., areas, circumferences of circles for diameters to 200 by one-eighths*, 183 pages; Smoley, *Segmental functions, text and tables giving simple methods of solving circular segments, and of computing its area, when the segment is given with only 2 of its 5 parts, viz.—the arc, the chord, the radius, the central angle and the height, with numerous examples illustrating the application of these methods*, 215 pages. The component parts of the volume have been issued in many editions and in various combinations with one another.

SOHON, HARRY

Engineering mathematics. New York, D. Van Nostrand Company, Inc., 1944. 278 p. illus. 23 cm. $4.50. 5242

Contents: Interpolation formulas. Determinants. Dimension analysis. Complex numbers and hyperbolic functions. Algebraic equations. Approximate solutions of algebraic equations. Fourier series. Differential equations. Gamma functions and Bessel's functions. Vector algebra. Vector calculus. Stretched string and round diaphragm. Skin effect problems. Answers to problems. Index.

Note: This book is intended for engineering students who have completed the study of the elementary calculus and for graduate engineers seeking to bolster their present knowledge of mathematics. It is intended to strengthen the student in algebra and to provide him with certain mathematical tools which depend on the calculus. The theory of determinants is taken up early in the work and together with matrix theory is used throughout the book. The method of identifying multiple roots of algebraic equations has been systematized, and emphasis is placed on methods of approximating all the roots, whether rational or irrational. The analysis of the result of an approximate Fourier analysis is an original work by the author.

SOKOLNIKOFF, IVAN STEPHEN, AND ELIZABETH S. SOKOLNIKOFF

Higher mathematics for engineers and physicists. Second edition. New York, McGraw-Hill Book Company, Inc., 1941. 587 p. illus. 23 cm. $7.50. 5243

Contents: Infinite series. Fourier series. Solution of equations. Partial differentiation. Multiple integrals. Line integral. Ordinary differential equations. Partial differential equations. Vector analysis. Complex variable. Probability. Empirical formulas and curve fitting. Answers. Index.

Note: A textbook for college students who have a working knowledge of the elementary calculus and intend to specialize in physics or engineering. The emphasis is upon the practical utility of mathematics as a tool in both of these fields, and those topics are selected which are of most frequent and immediate use in applied sciences. The illustrative material is intended to point out the underlying principles rather than to afford a solution of specific problems con-

fronting the engineer The second edition contains additional problems, new data on infinite series and differential equations, and a new chapter on complex variables, while the discussion of improper integrals contained in the first edition has been omitted.

THOMSON, WILLIAM TYRRELL

Laplace transformation, theory and engineering applications Englewood Cliffs, N J Prentice-Hall, Inc , 1950 230 p illus 21 cm. (Prentice Hall engineering design series, John A. Hrones, editor, and Prentice Hall electrical engineering series, William L Everitt, editor) $3 75 5244

Contents: Introduction to the Laplace transformation. Properties of the Laplace transformation. Dynamical applications. Structural applications. Complex-variable theory Partial differential equations. Difference equations. Closed loop systems. Analogies. Appendices. Index.

Note: A good, well-organized introduction to the Laplace transformation. It includes, both in the expository text and in the problems included for readers to solve, illustrations of many applications in applied mechanics, structural design, heat conduction, etc.

VER PLANCK, D W , AND B R. TEARE, JR.

Engineering analysis, an introduction to the professional method New York John Wiley & Sons, 1954 344 p illus 24 cm. $7 00 5245

Contents The professional method of dealing with engineering problems. Application of professional method. The understanding of principles fundamental to engineering. Translation into mathematics. Solutions of some ordinary differential equations. Checking. Interpretation of the mathematics. Problems. Index.

Note. How to think clearly in solving engineering problems is the topic of this book. Intended for undergraduate students in engineering colleges, it can be read with profit by most young engineering graduates as well. A relatively simple problem, the analysis of an invention is solved in the first chapter and the process is carefully described step by step. In later chapters, the problems considered require more complex mathematics, but the basic method is adhered to. Appropriately the two last chapters deal with methods of checking results and of interpreting them in the form of report or paper. There are 50 pages of practice problems.

WIENER, NORBERT

Extrapolation, interpolation, and smoothing of stationary time series with engineering applications New York Published jointly by The Technology Press of The Massachusetts Institute of Technology and John Wiley & Sons Inc., 1949 163 p illus 24 cm $4 50 5246

Contents Introduction. Résumé of fundamental mathematical notions. The linear predictor for single time series. The linear filter for single time series. The linear predictor and filter for multiple time series. Miscellaneous problems encompassed by the technique of this book. Appendixes Table of the Laguerre functions. The Wiener RMS (root mean square) error criterion in filter design and prediction, by N Levinson. A heuristic exposition of Wiener's mathematical theory of prediction and filtering, by N Levinson. Index.

Note A treatise which has primary applications in communications engineering but applies also to the design of certain types of servomechanisms and other systems in which the mathematics of probability must be taken into account in predicting performances. The methods discussed can be applied to problems with the following characteristics (to use the words of the author) the existence of a linear problem, invariant under the translation group, which is not capable of an exact solution but in hich measure of the failure of an approximate solution may be given as the mean of the square of the modulus of an expression known to be linear in terms of the function upon which we are operating. The exposition is largely in mathematical terminology and is intended for such groups as graduate engineers who are familiar ith Fourier series and related mathematical concepts.

WYLIE, CLARENCE RAYMOND, JR.

Advanced engineering mathematics. New York McGraw Hill Book Company, Inc., 1951 640 p illus 24 cm. $8 00 5247

Contents: Ordinary differential equations of the first order. Linear differential equations with constant coefficients. Simultaneous linear differential equations. Mechanical and electrical circuits. Fourier series and integrals. The Laplace transformation. Partial differential equations. Bessel functions. Analytic functions of complex variable. Integration in the complex plane. Infinite series in the complex plane. The theory of residues. Conformal mapping. Analytic functions and fluid mechanics. Vector analysis. Numerical analysis. Appendix: Selected topics from algebra and calculus. Index.

Not An engineering college text written by the chairman of the Department of Mathematics and Astronomy of the University of Utah. The treatment assumes a knowledge of mathematics through elementary calculus. Preliminary mathematics leading up to the material covered in the book is reviewed in the appendix. Numerous worked examples and practice exercises are a feature of the book.

ENGINEERING DRAWING

(Including Descriptive Geometry)

ALBERT, C D

Machine design drawing room problems. Fourth edition revised. New York John Wiley & Sons, Inc., 1951 538 p. illus. 24 cm. $6 75 5248

Contents Introductory discussion. Flanged shaft coupling. Bearing cap. Form factor and strength of gear teeth. Hydraulic automobile transmission. Valve gear of diesel engine. Strength and stiffness of shafts. Curved parts and frames. Helical spur reducing gears and housing. Steam engine flywheel. Air-operated arbor press. Thrustor-operated industrial brake. Car puller. Pump problems. Mechanical features of jib crane. Combination punch and shear. Balancing problems. Engineering materials. Allowable stresses, static and fluctuating loads. Straight and helical spur gears. Worm gearing. Graphics. Tolerances and allowances for metal fits. Bearings. Screw threads and screw fasteners. Miscellaneous information in tabular form. Index.

Note: A textbook used in undergraduate engineering courses offered to students ho have prior knowledge of basic mechanics and basic engineering drawing. Its purpose is to teach the essentials of machine design through the application of mechanical engineering drawing methods. Essentially it deals with design procedures that are carried out in the drafting department of engineering organizations rather than with drawing techniques. Each chapter is complete in itself and deals with the special problems connected with the designing of particular types of machine or machine part. The fourth edition was published in 1948. In this "fourth edition revised" important and rather extensive exchanges were made in the 25th and 26th chapters in order to bring them into accordance with the current Standard of Unified and American Screw Threads. Otherwise the text is unchanged from that of the fourth edition published in 1948, which, however contained several newly added chapters.

BISHOP, CALVIN C

Electrical drafting and design. Third edition. New York McGraw Hill Book Company, Inc. 1952 267 p. illus. 24 cm $4.50. 5249

Contents: General instructions for mechanical and electrical drafting. Circuit diagrams. Switchboard for a direct-current generator Switchboard for 2300-volt service. Outdoor substation. Residence wiring. Laying out wiring. Illumination. Industrial plant. Appendix. Index.

Note. An established text and reference manual on the making of drawings of circuit diagrams and wiring installations. It is addressed chiefly to student draftsmen enrolled in vocational schools, but it is suitable also as reference or refresher for working draftsmen in need of particular information on electrical drawings. The 125-page appendix consists mainly f tables of reference data useful to electrical draftsmen. The second edition was published in 1931. For this edition the work was ery substantially revised and enlarged.

Bishop, Carlton Thomas

Structural drafting. New York John Wiley & Sons, Inc., 1941 287 p. illus. 23 cm. $6.00. 5250

Contents: Introduction. The engineering department of a structural company. The manufacture of structural steel. The fabrication of structural steel. The structural drawing. Conventional methods of representation. Conventional methods of billing. Conventional methods of dimensioning. Drafting technique. Notes and tables. Working lines. Rivet spacing. Welding. Connections. Layouts. Marking systems. Plate girders. Roof trusses. Latticed girders. Beams. Columns. Bridge trusses. Bracing and miscellaneous members. Shop work. Erection plans and diagrams. Material order bills. Miscellaneous drawings and [illegible]. Checking and correcting drawings. Reinforced-concrete construction. Timber construction. Glossary of engineering terms. Index.

Note: This book corresponds in scope to the duties of the structural draftsman in the preparation of detailed working drawings for members of steel structures. Drawings for concrete and timber structures are also discussed, and billing practice is covered. There are many detailed illustrations, and the glossary of engineering terms includes about 500 items.

Carini, Louis Frank Bartholomew

Drafting for electronics. New York McGraw Hill Book Company Inc., 1946. 211 p. illus. 23 cm. $4.00. 5251

Contents: Schematic drafting. Fundamentals of instrumental drawing. Essentials of lettering. Abbreviations and letter symbols. Symmetry and balance. Schematic delineation. Schematic circuit properties. Schematic pictorial drawing. Industrial electronics. Technical outline drawings. Graphic integration. Checking of drawings. Preparing drawing prints. Drawings for reproduction. Appendices. List of visual aids. Index.

Note: Students and draftsmen who are well versed in engineering drawing often need supplementary instruction to prepare them for electronic drafting which is schematic and employs specialized symbols. This book provides this supplementary information, but it contains also a review of general methods that will be useful to persons who are beginning a study of engineering drawing. Much useful data, such as the R. M. A. color codes for capacitors and resistors, standard wire gages and conversion factors for various electrical units are given in the appendix.

Farmer, J Harold and others

Illustrating for tomorrow's production, by J. Harold Farmer Abbott J Hoecker and Francis F Vavrin. New York The Macmillan Company 1950. 199 p. illus. 24 cm. $5 75 5252

Contents (abridged): Part I, Preliminary to production illustration. The purpose of production illustration. Isometric and dimetric drawing. Method for making true-scale perspective drawings. Mechanical method for exploding views. Freehand drawing based on the mechanical construction principle. Part II, Making a production illustration. The rough layout. Rendering. Mounting and presentation of drawings. Reproduction of illustrations. Part III, Aircraft illustrating. Part IV, The production illustrator in advertising and industrial design. Bibliography.

Note: A short but practical introduction to the technique of making perspective drawings of such things as machines and machine parts for use in manufacturing and also for reproduction in publications, such as instruction manuals. Approximately half of the space is devoted to reproductions of illustrations, all of which either depict the making of production illustrations or show finished illustrations. The book is primarily useful to draftsmen and artists who wish to prepare for practical work in the field. The fourth part is only 11 pages long and hence is little more than an outline of the use of production illustrations in advertising and industrial design.

French, Thomas Ewing and Charles J Vierck

A manual of engineering drawing for students and draftsmen. With the assistance of Charles D Cooper Paul E. Machovina, Ralph S. Paffenbarger and Hollie W Shupe. Eighth edition. New York McGraw Hill Book Company Inc., 1953 715 p. illus. 25 cm. $8 75 5253

Contents: Introductory. Lettering. The selection of instruments. Applied geometry. Orthographic projection. Orthographic reading. Orthographic freehand drawing. Orthographic instrument drawing. Auxiliary views. Oblique views. Rotation. Sections and conventions. Intersections. Developments. Pictorial drawing. Perspective drawing. Pictorial sketching. The drawing and the shop. Dimensioning and notes. Precision and limit dimensioning. Screw threads. Threaded fasteners. Keys, rivets, and springs. Piping drawings. Welding drawings. Gears and cams. Working drawings. Jigs and fixtures. The elements of structural drawing. The elements of architectural drawing. Map and topographic drawing. Charts, graphs, and diagrams. Illustration. Notes on commercial practice. Bibliography of allied subjects. Appendix. Glossary of shop terms. Glossary of structural terms. Glossary of architectural terms. Supplementary visual materials. Index.

Note: Revised, established, and rearranged, the new edition of one of the most successful American engineering college texts has shorter chapters and four basic divisions: shape description, size description, basic machine elements, and working drawings. The chapter on screw threads now conforms to the new Unified Standard and the chapter on welding drawings now follows the latest ASA Standard. The term rotation is used in place of revolution to describe the process of turning the object about various axes, to obtain auxiliary views. The best of the old drawings have been kept and many new drawings have been added. Before his death Thomas E. French was Professor of Engineering Drawing at Ohio State University for many years. All of the other authors named on the title page of the eighth edition are currently members of the Department of Engineering Drawing of the same university.

French, Thomas Ewing and Carl L. Svensen

Mechanical drawing a text with problem layouts. Fifth edition, revised and enlarged by Carl L. Svensen. New York McGraw Hill Book Company Inc., 1948 437 p. illus. 23 cm. 5254

Contents: The language of drawing. Learning to draw. Lettering. Theory of shape description. Sketching. Sections. Auxiliary views and revolutions. Principles of size description. Technique of the finished drawing. Bolts, screws, and other fastenings. Mechanical drafting. Pictorial drawing. Production illustration. Aircraft drafting. Working drawings. Graphic solutions. Cams and gears. Sheet-metal drafting. Architectural drafting. Structural drafting. Map drafting. Problems. Appendix. Index.

Note: A standard text for instruction at the vocational school rather than the college level. In short, it is used in teaching the rudiments of drafting. It provides an exceptionally thorough introduction at the beginning practical level. A sixth edition was published in 1957 448 p., $4.80.

Giachino, J W., and Henry J Beukema

American Technical Society's drafting. Chicago American Technical Society 1954 243 p. illus. 24 cm. $3.50. 5255

Contents: What is drafting? Occupational opportunities in drafting. Learning to draw. Making a layout drawing. Lettering a drawing. Dimensioning a drawing. Making a working drawing. Drawing sectional and auxiliary views. Learning about assembly drawing and fasteners. How to make pattern drawings. Drawing without instruments. Planning a house. Laying out schematic diagrams. Drawing graphs and charts. Making prints and reproductions. Appendix. Index.

Note: A well-planned introductory text in which important terms, concepts and instruments are explained both visually and in words. The examples illustrate the application of drafting in various crafts and branches of engineering, such as machine design, sheet metal work and building. Each chapter includes in addition to the traditional problems for students, a "self quiz" that will facilitate comprehension for many students. More elementary and less complicated than the typical introductory text in mechanical drawing, the book is suitable for readers who are lacking in engineering education.

Giesecke, Frederick Ernest and others

Technical drawing by Frederick E. Giesecke, Alva Mitchell and Henry Cecil Spen

cer Third edition New York The Macmillan Company, 1949 851 p illus. 24 cm $8 50 5256

Contents. Introduction. Instruments and materials. Instrumental drawing. Geometry of technical drawing. Lettering Projections. Multiview projection. Sectional views. Auxiliary views. Revolutions. Axonometric projection. Oblique projection. Perspective. Technical sketching. Intersections and developments. Dimensioning. Fasteners. Shop processes. Working drawings. Gearing and cams. Pipe, fittings, and valves. Welding. Shading. Patent drawing. Graphs. Architectural drawing. Structural drawing. Topographic drawing. Aeronautical drafting. Reproduction of drawings. Appendix. Index.

Note The clarity and thoroughness with which many aspects of technical drawing are presented in this volume make it of value both as text in colleges and vocational schools, and as a basic reference book. The techniques of making technical drawings are explained in detail, but the emphasis is on fundamental principles. The many excellent drawings and illustrations constitute large and important part of the text. This edition has been enlarged and revised. In particular chapters dealing with such topics as dimensioning, axonometric projections, shop processes, and architectural dra ing have been rewritten and expanded and new chapter on aeronautical drafting has been added.

GRANT, HIRAM E

Practical descriptive geometry New York McGraw Hill Book Company, Inc. 1952 253 p illus 24 cm. $4 75 5257

Contents Introduction. Reference planes. The basic lines and planes. Basic auxiliary views. Points and lines. Lines and planes. Revolution. Force diagrams. Point, line, and plane relations with cylinders, cones, and spheres. Conic sections and their applications. Mining, geology and civil engineering. Shades and shadows. Curved surfaces. Plane and curved surface intersections. Developments, transitions, and the helix. Intersection of surfaces. Graphical accuracy Index.

Note A new textbook for use in college courses. Theory and practice are combined and some of the applications shown are unexpected as, for instance, the application of descriptive geometry to the layout of a pipe line on steep mountainside. There are 319 figures, and the majority of them contain reproductions of more than one drawing.

HOELSCHER, RANDOLPH PHILIP, AND CLIFFORD H SPRINGER

Engineering drawing and geometry New York John Wiley & Sons 1956 498 p illus. 29 cm $8 00 5258

Contents Introduction. Lettering. Use and care of instruments. Geometrical constructions Geometric projections. Sketching. Orthographic projection. Sectional views. Dimensioning. Fasteners. Shop terms and processes. Drawings for interchangeable assembly Auxiliary projections. Geometry of engineering drawing. Intersections and developments. Axonometric projection. Oblique projection. Perspective. Charts and diagrams. Map drawing. Architectural drawing. Structural drawing. Pipe drawing. Machine drawing. Tool drawing. Welding drawing. Reproduction of drawings. Patent Office drawings. Appendix. Index.

Note. The senior author of this new text is head of the Department of General Engineering of the University of Illinois, and his co-author is Professor of Engineering in the same department. The purpose of their book is to train engineers rather than draftsmen in drawing techniques. Drawing is not slighted, but there is more than the usual emphasis on principles and other matters basic in engineering communication. Also, the student or reader is afforded an insight into the special techniques and requirements of variety of types of drawing, such as map drawing, structural drawing and patent office drawing The book is well organized and, of course, fully illustrated It supersedes *Engineering drawing* by *H. H. Jordan* and R. P Hoelscher.

HOELSCHER, RANDOLPH PHILIP, AND OTHERS

Industrial production illustration for students draftsmen and illustrators by Randolph Philip Hoelscher Clifford Harry Springer and Richard F Pohle Second edition New York McGraw Hill Book Company, Inc., 1946 243 p. illus. 28 cm. $7.50. 5259

Contents Uses of pictorial drawing. Lettering. Orthographic projection. Orthographic sketching. Axonometric projection—conventional construction. Axonometric projection—exact method. Axonometric sketching. Oblique projection. Sketching in oblique. Perspective. Shades and shadows in perspective. Perspective sketching. Shading. Special equipment for making pictorial dra ings. Problems. List of visual aids. Index.

Note. During World War II, three-dimensional sketches and drawings were found to be valuable aids in the rapid instruction of beginning workers untrained in the reading of blueprints. This work, first published in 1943, is one of the pioneer American texts on the subject. It is designed to impart thorough understanding of the theory of perspective and other types of pictorial illustration and to introduce the reader to the practical techniques that have been developed for the economical production of such illustrations. This edition is greatly improved over the original edition. The text has been set in type, new illustrations and a considerable amount of textual material have been added.

HOOD, GEORGE JUSSEN

Geometry of engineering drawing, descriptive geometry by the direct method. Third edition. New York McGraw Hill Book Company, Inc., 1946 362 p illus. 24 cm. $3.00. 5260

Contents Introduction. Principal lines. Views and their relations. Auxiliary views. Oblique views. Design of structures. Straight lines. Curved lines. Planes. Intersection and development of surfaces. Single curved surfaces. Warped surfaces. Double curved surfaces. Topographical and mining problems. Pictorial views. The projection method. Problems. Index.

Note A second-year college textbook for engineering students based on the method of three-dimensional visualization of the structure or object as opposed to the method of projections, ground lines and traces of planes. The student is taught to see and make drawings as if they were the objects themselves. This edition has been slightly enlarged by the inclusion of some new material, such as chapter on views and their relations, and by the addition of photographs of engineering structures which illustrate the applications of descriptive geometry The large collection of problems has been revised with new ones added and others deleted.

HOWE, HAROLD BARTLETT

Descriptive geometry a pictorial approach. New York The Ronald Press Company, 1951 332 p illus. 24 cm $4 25 5261

Contents. Introduction. Lines. Planes. Lines and planes. Mining problems. Revolution. Vectors. Single-curved surfaces. Convolutes. Warped surfaces. Double-curved surfaces. Intersection of surfaces. Perspective. Application problems. Index.

Note. The chief characteristic of this introductory textbook is best stated in the author's words. the direct-method approach has been substituted for the original trace-of-plane method, involving the four quadrants, which was closely tied to the mathematics from which it sprang. Some emphasis is placed on developing the reader's ability to make pictorial sketches, since this type of illustration is now widely used in industry

JOHNSON, WILLIAM HARDING AND LOUIS V NEWKIRK

Modern drafting New York The Macmillan Company, 1944 197 p illus. 21 cm. (Industrial arts education series) $4 00 5262

Contents Draftsman's language and tools. Lettering and techniques. Reading drawings. Working drawings. Pictorial drawing and freehand sketching. Geometric constructions. Sheet-metal drafting and surface development. Machine drafting. Aircraft drafting. Architectural drafting. Graphs and maps. Tracing, blue-printing, and duplicating.

Note A simple text designed for students of the high-school level and for older beginners desiring an introduction to the subject. It deals with the fundamental procedures of drafting and their industrial applications. The volume is well illustrated, and there is an index.

KATZ, HYMAN H.

Aircraft drafting. New York The Macmillan Company 1946. 386 p. illus. 29 cm. $7.25 5263

Contents The airplane. Drawing instruments and their use. The pencil and their use. The alphabet of lines. Lettering. Applied geometry. Orthographic projection. Making [illegible] drawing. Auxiliary views. Sectional views. Dimensioning. Pictorial drawing. Production changes [illegible] drawings. Materials in aircraft. Machines and processes. Fasteners. Standard parts. Dash numbers. Bill of materials. Calculation of weights. Lofting. Design. Index.

Note A basic textbook and reference manual which assumes no previous drafting experience, and which emphasizes the close relationship of engineering to drafting. In addition to the usual fundamentals of drafting, the orthographic and pictorial drawing methods, dimensioning procedures, and lofting techniques peculiar to the airplane industry are presented. The various aircraft manufacturing operations, such as [illegible], casting, machining, welding and riveting, are described as an aid to the beginning draftsman. The [illegible] profusely illustrated.

KATZ, HYMAN H.

Technical sketching and visualization for engineers. New York The Macmillan Company 1949 163 p. illus. 26 cm. $6.50 5264

Contents Introduction. Technical sketches. Straight lines. Curved lines. Proportion. Lettering—symbols—practice—problems. Orthographic sketching. Pictorial sketching. Shading. Measurements from the model. Non-graphical visualization. Appendix. Index.

Note A good exposition of the techniques of freehand pictorial sketching which are useful in visualizing mechanical ideas and designs. There is also some discussion of clay and cardboard models. Methods which can be followed to produce the fairly precise sketches which are most useful in the representation of machines and machine parts are emphasized. The book is intended for draftsmen and engineers already familiar with mechanical drawing.

LENT DEANE

Machine drawing. New York Prentice-Hall, Inc., 1951 523 p. illus. 24 cm. (Prentice-Hall engineering design series John A. Hrones, editor) $7.00. 5265

Contents Part I. The design phase. The design of machines. Part II. The detail phase. Detail drawings. Shape description. Technical sketching. Auxiliary and partial views. Sectional views. Symbols and conventional representation. Size description—dimensioning. Manufacturing processes. Control of manufacturing accuracy. Technique of [illegible] drawing. Finished detail drawings. Part III. The [illegible] phase. Assembly drawings. Standard parts. Problems. Appendix. Index.

Note A textbook organized so that [illegible] may be used in either vocational school or college courses offered to students who are preparing to become draftsmen or to work in machine design. Only those aspects of mechanical drawing which are useful in the drawing of machine parts are covered. The discussions are clear and full enough so that in most parts they can be understood without the assistance of an instructor.

LEVENS, A. S

Graphics in engineering and science. New York John Wiley & Sons, Inc., 1954 696 p. illus. 25 cm. $8.00 5266

Contents (abridged) Part I. Fundamentals and applications of orthogonal projection. Principles of projection. Application of the basic principles of orthogonal projection. Developments. Visibility. Axis problems. Intersection. Pictorial drawing. Part II. Technical drawing practice. Sections and conventions. Threads and fasteners. Cams and gears. Part III. Graphical solutions and computations. Graphical mathematics. Functional scales. Empirical equations. Nomography. Graphic statics. Graphical calculus. Graphics in research. Appendix. Geometrical constructions. Tables. List of [illegible] [illegible] symbols. Angles and true values in pictorial orthographic views. The use of the [illegible] method in the solution of [illegible] differential equations. Selected bibliography. Index.

Note Although the book contains some material which is of interest to draftsmen, [illegible] [illegible] on the graphic language rather than on mechanical drawing, and is intended for the instruction of scientists and engineers [illegible] will use drawing techniques as mediums of expression or in mathematical computations. In the chapters devoted to illustrating techniques, the emphasis is on pictorial drawings, however some mention of the orthographic techniques are included. The greater part, on the use of graphic methods in solving mathematical problems, is of interest not only to students but also to graduate scientists and engineers who were graduated before engineering school curricula included courses on graphical methods of computation. The author is Professor of Engineering Design in the University of California.

LUZADDER, WARREN JACOB

Fundamentals of engineering drawing for technical students and professional draftsmen. Third edition. Englewood Cliffs N J Prentice-Hall Inc. 1952 721 p. illus. 24 cm. $6.50. 5267

Contents. Introduction. Drawing materials and equipment. Use of instruments and equipment. Engineering geometry. Technical lettering. The theory of projection. Multiview drawing. Auxiliary views. Revolution. Sectional views. Conventional practices and representations in orthographic drawing. Freehand drafting. Ink work and tracing. Pictorial drawing. Shop processes. Dimensioning. Screw threads and fasteners. Piping drawings. Working drawings. Welding drawings. Machine elements. Developments and intersections. Architectural drawing. Structural drawing. Topographic and engineering map drawing. Shade lines and surface shading. Patent Office drawings. Reproduction and duplication of engineering drawings. Engineering graphs and charts. Graphical calculus. Appendix. Index.

Note. A successful textbook which is widely used for the instruction of students who are studying to become draftsmen, and to a somewhat lesser extent for the instruction of students preparing for engineering careers. It covers the subject broadly and at the same time in detail. There are many hundreds of excellent illustrations. The verbal exposition is full and explicit in accordance with the author's aim to make the book as nearly self-teaching as possible. The second edition was published in 1946. In this third edition, the scope of the book and style of presentation are unchanged, but useful and fairly extensive revisions have been made in both the text and illustrations.

LUZADDER, WARREN JACOB

Technical drafting essentials for vocational and technical students. Architectural drafting section, by William S. Hornung. New York Prentice-Hall Inc., 1950. 376 p. illus 24 cm. $4.00. 5268

Contents (abridged) Drawing instruments and equipment. Engineering geometry. Technical lettering. Multiview drawing. Freehand drafting. Sectional views. Conventional practices and representations in orthographic drawing. Auxiliary views. Revolution. Ink work and tracing. Dimensioning. Screw threads, fasteners, and welding. Working drawings. Piping drawings. Gears and cams. Pictorial drawing. Sheet metal drafting. Map drafting. Structural drafting. Architectural drafting. Appendix. Index.

Note A revision of the author's well-known *Fundamentals of engineering drawing*, for use in courses in high schools and trade schools and for self-instruction. It contains considerably less material than the earlier book but is full enough to prepare students for practical work. There are 316 figures, many of which include reproductions of more than one drawing.

MILLER, HENRY WILLARD

Descriptive geometry Seventh edition. New York John Wiley and Sons, Inc., 1941 254 p. illus. 23 cm. $4.00. 5269

Contents Abbreviations, notations, conventions, definitions. The point and line. Planes. Simple relations of the point, line, and plane. Higher relations of the point, line, and plane. Applications of revolution in measurement of plane figures. Lines and surfaces. Tangent planes. Intersection of surfaces. Development of cylinders and cones. Shades and shadows. Perspective. Test exercises. Index.

Note A textbook for engineering college students. The author pays tribute to the basic works of Monge, Warren, and Church, but he has successfully adapted his treatment of the subject to the needs of present-day engineers. The seventh edition contains 25 new sheets of test exercises designed to supplement the dis-

cussions and illustrations of the text as well as to test the student's understanding of theory

PARÉ, E G, AND OTHERS

Descriptive geometry By E G Paré, R. O Loving, and I. L Hill New York The Macmillan Company, 1952 309 p illus 25 cm. $4 25 5270

Contents (abridged) Orthographic projection. Primary auxiliary views. Lines. Planes. Piercing points. Intersection of planes. Angle between planes. Parallelism. Perpendicularity Angle between line and oblique plane. Mining and civil engineering problems. Revolution. Concurrent vectors. Plane tangencies. Intersections of planes with solids. Developments. Intersections of surfaces. Shades and shadows. Pictorial projections. Conics. Map projection. Spherical triangles. Appendixes Graphical accuracy Geometric constructions. Classification of geometric forms. Index.

Note. A textbook for use in introductory college courses. The authors have taken pains to organize it so that it can be easily assimilated by beginning students. Applications are indicated both in the exposition and in the problems, but the abstract phases of the subject are not neglected.

ROEVER, WILLIAM HENRY

The Mongean method of descriptive geometry New York The Macmillan Company 1933 151 p illus 20 cm $5 50 5271

Contents Introduction. Book I, The Mongean method of double orthographic projection Representation of the point. Representation of the straight line—its traces. Representation of the plane. Profile, or third plane of projection. Fundamental problems of geometry of position. Other problems of geometry of position. Problems involving perpendicularity Metrical problems. Other devices for the solution of metrical problems. Index.

Note. A revision for American use of that portion of Professor Loria's work on the Mongean method in his *Vorlesungen über darstellende Geometrie*, published in Germany in 1907 This text was approved by Professor Loria before publication. The original work has been modified to reduce the mathematical prerequisites and to emphasize the mathematical aspects of descriptive geometry The subject is of interest to mathematicians and engineers.

ROWE, CHARLES ELMER, AND JAMES DORR McFARLAND

Engineering descriptive geometry, the direct method for students draftsmen architects and engineers. Second edition. Princeton N J D Van Nostrand Company Inc. 1953 352 p illus. 23 cm. $5 50 5272

Contents Introduction. Principal views. Auxiliary views. Oblique views. Line and plane problems. Surfaces and developments. Surfaces and intersections. Warped surfaces. Geology and mining problems. Engineering problems. The Mongean method of descriptive geometry Shades and shadows. Perspective drawing. Problems. Index.

Note. The "direct method" is used in preference to the Mongean method in this standard engineering college textbook. Any problem in descriptive geometry is treated as a space relationship and is solved directly on the drawing board without using ground lines, folding lines, traces of planes or other devices. Fourteen fundamental principles which are concisely stated in the introduction form the working basis for the solution of all problems. The first edition was published in 1939 Although the length of the book has been increased by over 30 pages in this second edition, there are no material changes in organization, level or scope. However the number of illustrations has increased, and there are now 385 figures.

RULE, JOHN THOMAS, AND EARLE F WATTS

Engineering graphics. New York McGraw Hill Book Company, Inc. 1951 298 p illus 24 cm $5 50 5273

Contents. The straight line and circle. The construction of the conic sections. Projective constructions. Roulettes, glissettes, and spirals. Vector geometry Graphical scales. Empirical curves. Periodic curves. Graphical calculus. The geometry of projection drawing. Axonometry Conventions of practical drafting. Appendixes. American drafting standards. Geometric proofs. Table of chords. Table of logarithms. Table of natural trigonometric functions. Table of exponentials. Values of e^{x}—hyperbolic logarithms. Index.

Note. In this college textbook on engineering drawing the use of graphic methods in the analysis of engineering problems is given considerably more emphasis than are the techniques of making representational drawings. Both aspects are well covered as to theory and to basic techniques, but there is comparatively little in the book on the drawing of machine parts, lettering, etc. On the other hand, such chapters as that on graphical calculus cover a phase of the subject that is omitted entirely from some of the older texts.

RUSINOFF, SAMUEL EUGENE

Practical descriptive geometry Illustrated. Chicago American Technical Society, 1947 259 p illus. 22 cm. $5 00 5274

Contents Introduction. Orthographic projection. Auxiliary views. Problems of point, line, and plane. Intersection of planes. Curved lines and surfaces. Intersection of planes and curved surfaces. Development of curved surfaces. Intersection of surfaces. Solution of miscellaneous problems by descriptive geometry

Note. A thoroughly practical textbook for use in trade-school and engineering-college courses. It opens with a short review of mechanical drawing fundamentals, following which each principle of descriptive geometry is explained step by step. Practical applications in the automotive, aviation, machine-tool, and steel industries are shown in the illustrative examples and in the problems for students.

SCHUMANN, CHARLES H.

Descriptive geometry a treatise on the graphics of space for the scientific professions. Fourth edition. Princeton, N J D Van Nostrand Company, Inc., 1946 338 p. illus. 23 cm. $4 00 5275

Contents. Introductory principles and problems. Problems on points, lines and planes. Revolved views and auxiliary views. Further problems on points, lines and planes. Practical applications. Lines. Single curved surfaces. Warped surfaces. Double curved surfaces and surfaces of revolution. Intersections of surfaces. Appendix. Plane and solid geometry theorems, plane curves. Index.

Note. A successful textbook first published in 1937 and since reprinted many times in its various editions. It contains more matter than some introductory textbooks in this subject. Notably it makes use of both the "direct method" and the older method of plane traces. However the emphasis is on the direct method. As shown above, there is a chapter on warped surfaces. Approximately 500 problems are included.

SMUTZ, FLOYD A, AND RANDOLPH F GINGRICH

Descriptive geometry, essential principles and applications for students of engineering and architecture. Third edition Princeton D Van Nostrand Company Inc., 1950. 142 p. illus. 25 cm $4 00 5276

Contents Introduction. Projections of a point. Auxiliary projections of lines. Auxiliary projections of planes. Revolution method. Nonintersecting lines. Surfaces. Tangents to surfaces. Intersections of surfaces Applications to shades and shadows. Glossary Index.

Note. The auxiliary plane method, rather than the Mongean system, is used in this standard textbook for students of drafting and engineering. The authors have purposely omitted the abstract aspects of descriptive geometry and have concentrated on problems and solutions of practical value. Detailed solutions of typical problems are included in the expository text. Each chapter concludes with a generous number of problems for the student.

STREET, WILLIAM EZRA

Technical descriptive geometry New York D Van Nostrand Company Inc., 1948 179 p. illus. 25 cm. $4 25 5277

Contents: Orthographic projection. Primary auxiliary views. Secondary auxiliary views. Revolutions. Developments. Intersections. Perspective. Shades and shadows. Vector diagrams. Index.

Note: A text for the engineering student who has had at least one semester of drawing. Geometry as applied to the structure of machines and to geology is emphasized, using methods of progressive complexity. Many problems of a practical nature are included. "The Nomenclature Committee Report of the Drawing and Descriptive Geometry Division of S. P. E. E. (now A. S. E. E.) for descriptive geometry has been adopted. The text, illustrations and problems are in conformity with the American Standards.

SVENSEN CARL LARS

Machine drawing a text and problem book for technical students and draftsmen. Third edition. New York D Van Nostrand Company Inc., 1945 280 p. illus. 23 cm. $4.00 5278

Contents: Elementary principles. Threaded fastenings. Welded and riveted construction. Principles and practice of dimensioning. Machine drawing. Machine sketching. Machine details. Bearings. Pulleys, belts, etc. Shafting and couplings. Jigs, fixtures, and details. Gears and cams. Piping drawings. Problems and studies. Supplementary problems. Appendix.

Note: The material in this excellent book is designed to supplement the contents of the typical college course in engineering drawing. It may be used in formal courses or for self-instruction or reference by persons already employed who have had an introductory course. The subject is covered with a fair degree of comprehensiveness. There are more than 450 illustrations, approximately 400 problems, and many tables of reference data.

TREACY JOHN

Production illustration the techniques and applications of perspective engineering drawings. New York John Wiley & Sons Inc., 1945. 202 p. illus. 23 cm. $6 75 5279

Contents: Part I Introduction. Drafting standards and practices. Shading techniques. Reproduction aids. Reproduction methods for illustration. Photographic illustrations. Linear perspective. Free-hand drawing. Part II General uses of illustrations. The introduction of production illustration. Organization of an illustration department. General reference illustrations. Perspective engineering drawings. Manufacturing illustrations. Miscellaneous applications. Appendix: The perspective drawing board. Function illustration. Prepared shading, textures and symbols. Instruction in production illustration. Index.

Note: An excellent presentation of the relatively new techniques used in the production of perspective drawings for use in industry together with a survey of the uses of such illustrations. The treatment is practical and on the level of persons engaged in the making and use of production illustrations. The book is also suitable for use in college and vocational school courses.

TURNER, WILLIAM WIRT AND OTHERS

Basic engineering drawing a text integrating engineering drawing descriptive geometry machine drawing. By William Wirt Turner Carson P Buck, and Hugh P Ackert. New York The Ronald Press Company 1950. 669 p. illus. 23 cm. $5 50 5280

Contents: Drafting equipment. The use and care of drafting instruments. Conventional lines and their applications. Lettering. Orthographic projection. Freehand sketching. Auxiliary views. True length. True size. Piercing points. Perpendicular relationships. Revolution. Intersections and developments. Pictorial drawing. Sections and conventions. Dimensioning. Fasteners, piping, and welding. Working drawings. Gears and cams. Graphs. Drafting as it applies to various types of engineering. Appendix. Index.

Note: A textbook for use in full-length introductory courses in engineering colleges. As indicated in the subtitle, it includes certain allied subjects, such as descriptive geometry which are often taught as separate courses. Also, there is more emphasis on perspective and other types of pictorial drawings than is found in some of the long established texts. This aspect reflects the wide use of such drawings in American industry where they have been found easier for beginning machinists and other mechanics to follow than conventional plane drawings. The appendix includes a useful glossary

VAN GIESON D WALTER

Electrical drafting applied to circuits and wiring. New York McGraw Hill Book Company Inc. 1945 140 p illus. 22 cm. $3.50 5281

Contents: Symbols. The schematic diagram. Modern methods. The detailed wiring plan. Circuit and wiring plans—lighting—railway signals—communication—radio and television—power. Switchboard-wiring plans. Car-wiring plans. Ship-wiring plans. Aircraft-wiring plans. Traffic-signal wiring plans. Animated-sign lighting. Neon and fluorescent lighting. Instruments and indicating devices. Checking the wiring plan. Equipment-location plans. Conduit and location plans. Notes and specifications. Drawing titles, subtitles, etc. Alterations and revisions to drawings. Office practice. Drafting kinks. Appendix. Index.

Note: A practical exposition of the subject. It is intended for engineers, draftsmen, electricians, and others who already know the fundamentals of drafting but who need more knowledge of the special technique of drawing electrical circuits than is offered in general textbooks.

WARNER, FRANK M

Applied descriptive geometry with drafting room problems. Fourth edition. New York McGraw Hill Book Company Inc., 1954 247 p. illus. 23 cm. $4.50 5282

Contents: Orthographic drawing. Fundamental auxiliary lines. Point, line and plane problems. Revolution. Concurrent noncoplanar forces. Curved lines and surfaces. Intersection of surfaces. Practical problems. Drafting-room problems. Appendix. Index.

Note: The change-of-position, or direct method, of drawing is taught in this introductory textbook, which is addressed to undergraduate engineering students. The book is well-illustrated and has an attractive format. A great variety of problems is included.

WATTS EARLE FRANCIS, AND JOHN T RULE

Descriptive geometry New York Prentice Hall Inc., 1946 301 p. illus. 24 cm. $4.50 5283

Contents: Principles of orthographic projection. Fundamental problems relating to lines and planes. On the systematic solution of problems. Graphical computations. Polyhedrons. Curved surfaces. Surfaces of general form. Horizontal projection. Analytic solutions. Pictorial drawing. Simple shadows. Practical applications. Appendices: Precision in drawing. Properties of plane figures. Stereoscopic drawing. Natural trigonometric functions. Table of chords. Index.

Note: An engineering college text which stresses the practical side of the subject. It is the authors' contention that engineers should make greater use of purely graphical methods for solving technical problems. The basic projections of the point, line, and plane are given and these are followed by more complex discussions covering topics such as the representation of an equation in three variables, Cartesian coordinates, perspective, and the development of various curved surfaces. The authors are members of the faculty of the Massachusetts Institute of Technology.

ZOZZORA, FRANK

Engineering drawing. New York McGraw Hill Book Company Inc. 1953 369 p illus. 30 cm. $5.00. 5284

Contents: Introduction. Engineering lettering. Orthographic projection. Freehand detail drafting. Instruments and their use. Geometrical constructions. Shop processes. Dimensioning. Sectional and conventional practices. Primary auxiliary views. Pictorial drawing. Common fasteners. Assembly drawing. Intersections and developments. Cams and gears. Inking procedure. Bibliography. List of visual aids. Appendix. Index.

Note: A liberal use of pictorial illustrations to illustrate the techniques of engineering drawing is one of the outstanding features of this work. These illustrations appear not only in the chapter on pictorial drawing but throughout the book and are used as a means of instruction. Although less ground is covered than in some of the established college texts, there is adequate material on the fundamentals. The book is particularly suited to the needs of students who are preparing for careers in draftsmanship. The author is Head of the Department of Engineering Drawing and Descriptive Geometry in the University of Delaware.

APPLIED MECHANICS

ADVANCES IN APPLIED MECHANICS Volume I Edited by Richard von Mises and Theodore von Kármán. New York Academic Press, Inc., 1948 293 p illus. 24 cm. $8.50 5285

Contents. Recent advances in the mechanics of boundary layer flow by H. L. Dryden. Modern trends in nonlinear mechanics, by N Minorsky Survey of papers on elasticity published in Holland 1940–1946 by C. B Biezeno. A mathematical model illustrating the theory of turbulence, by J M. Burgers. On numerical methods in wave interaction problems, by H. Geiringer On Bergman's integration method in two-dimensional compressible fluid flow by R. V Mises and M. Schiffer Bibliography Author index. Subject index.

—— Volume II Edited by Richard von Mises and Theodore von Kármán New York Academic Press, Inc., 1951 233 p illus 24 cm. $7 00 5285A

Contents On the statistical theory of isotropic turbulence, by T V Kármán and C. C. Lin. The laminar boundary layer in compressible flow by G. Kuerti. Bending I curved tubes, by R. A. Clark and E. Reissner Recent developments in inverse and semi-inverse methods in the mechanics of continua, by P F Neményi. Theory of filtration of liquids in porous media, by P Ya. Polubarinova-Kochina and S. B. Falkovich. Author index. Subject index.

—— Volume III. Edited by Richard von Mises and Theodore von Kármán. New York Academic Press, Inc., 1953 324 p. illus 23 cm. $9 00 5285B

Contents Boundary layer problems in applied mechanics, by G. F Carrier The one-dimensional isentropic fluid flow by O Zaldastani. Turbulent diffusion—mean concentration distribution in a flow field of homogeneous turbulence, by F N Frenkiel. On aerodynamics of blasts, by H. F Ludloff. On the presence of shocks in mixed subsonic-supersonic flow patterns, by G. Guderley Vortex systems in wakes, by L. Rosenhead. Some recent results in the theory of an ideal plastic body Non-autonomous systems, by A. I. Bellin. Author index.

—— Volume IV Edited by H L. Dryden and Theodore von Kármán. Managing editor G Kuerti associate editors, F H. van den Dungen L. Howarth, J Pérès. New York Academic Press Inc., 1956 413 p illus 23 cm $10 00 5285C

Contents The turbulent boundary layer by F H. Clauser Nonlinear elasticity by T C. Doyle and J L. Ericksen. Physical and statistical aspects of fatigue, by A. M. Freudenthal and E. J Gumbel. Three-dimensional boundary layer theory by F K Moore. Dislocation theory of plasticity of metals, by G. Schoeck. The Poincaré-Lighthill-Kuo method, by H. S. Tsien. On the concept of elastic stability by H. Ziegler Author index. Subject index.

Note. A review series edited on the plan of publishing monographic surveys of topics rather than surveys of the literature of specified periods. However recent literature is emphasized in most I the surveys as would be expected. Each paper is written by an expert and is based both on the author's own knowledge of the field and on the literature. An extensive bibliography is always included. The chief purpose of the series is to aid engineers and scientists in keeping abreast of developments in fields allied t their own specialties. Accordingly the treatment of each subject is on professional level.

AMERICAN MATHEMATICAL SOCIETY

Symposium on Applied Mathematics Transactions of the Symposium on Fluid Mechanics and Computing held at New York University, April 23–24, 1953 The first symposium on applied mathematics sponsored by the American Mathematical Society and Office of Ordnance Research, U S. Army Editorial committee, Garrett Birkhoff K. O Friedrichs and T E Sterne. New York Interscience Publishers, Inc. 1954 243 p. 26 cm $5 00 5285D

Contents Mathematical methods in compressible flow theory by M. J Lighthill. Boundary layer problems in applied mathematics, by G. F Carrier. Fourier synthesis of homogeneous turbulence, by G. Birkhoff. One-dimensional anisentropic flows, by G. S. S. Ludford and M. H. Martin. Approximate methods for computing flow fields, by J H. Giese. Results and conjectures in the mathematical theory of subsonic and transonic gas flow by L. Bers. The singular solutions and the Cauchy problem for generalized Tricomi equation, by A. Weinstein. Remarks on the theory of partial differential equations of mixed type and applications to the study of transonic flow, by P Germain. Discussion on transonic flow by R. von Mises. Some problems solvable on computing machines, by M. Lotkin. Weak solutions of nonlinear hyperbolic equations and their numerical computations, by P D Lax. Computation of one dimensional compressible flows including shocks, by L. H. Thomas. The deformation of a thin material shell of non-uniform thickness by detonation wave, by G. E. Hudson. Measurement of spherical shock waves, by H. Schardin.

Note. Although entitled "Transactions, this volume contains only papers which were presented at the Symposium on Fluid Mechanics and Computing. Transcripts of discussions are not included, and there is no index. However there are illustrations with some of the papers and bibliographies with most of them. Most of the papers describe recently developed methods of mathematical attack on complex problems in fluid flow. Several of them describe in detail the techniques for handling the calculations on high speed computing machines.

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on new methods for particle size determination in the sub-sieve range. Philadelphia American Society for Testing Materials 1941 111 p illus. 23 cm. (Special technical publication #51) $1.25 5285E

Contents Methods for determining particle size distribution, by H. E. Schweyer and L. T Work. Shape and surface of fine powders by the permeability method, by P C. Carman. Surface area of Portland cement, by P S. Roller and P V Roundy Jr An improved hydrometer method for use in fineness determinations, by A. Klein. The determination of subsieve particle size distributions by sedimentation method, by S. W Martin. The electron microscope in the determination of particle size characteristics, by J. Hillier. A new method for measuring the surface areas of finely divided materials and for determining the size of particles, by P H. Emmett. Specific surface of pigments by adsorption from solution, by W W Ewing Appendix.

Not A collection of technical papers on various methods of measuring particle size distribution and specific surface, including discussion of theory and results of experimental research. Extensive bibliographies are also presented.

BINDER, R. C

Advanced fluid dynamics and fluid machinery New York Prentice-Hall Inc., 1951 426 p. illus. 22 cm. $6 75 5286

Contents. Part I, *Fluid dynamics* I troduction. Steady one-dimensional compressible flow Compressible flow in channels with friction and heat transfer Boundary-layer flow turbulence, and energy losses. Part II, Fluid machinery General features of dynamic machines. Axial-flow fans, pumps, and compressors. Centrifugal fans, pumps, and compressors. Fluid couplings and fluid torque converters. Jet compressors and jet pumps. Turbines. Part III, *Fluid dynamics*: Unsteady flow in one dimension—fluid vibrations. General analytical relations. Steady two-dimensional incompressible flow Steady two-dimensional compressible flow General analytical relations for viscous flow Vector analysis in flow studies. Appendix. Answers to problems. Index.

Note Taking up where the author *Fluid mechanics*, described below leaves off this book is directed to engineering college students he have completed course based on that book or an equivalent course. It is more analytical than the introductory book and covers number of topics not covered in it. The 114-page second part

[illegible] types of modern machines which are based on the phenomena of fluid dynamics. Selected literature references are included [in] the chapters.

BINDER, R. C.
Fluid mechanics. Third edition. Englewood Cliffs, N J Prentice-Hall, Inc., 1955 388 p. illus. 23 cm. $5.95 5287

Contents: Part I, Basic relations: Introduction—some fluid properties. Fluid statics. Kinematics of fluid flow. Dynamic or momentum equation. Energy equation for the steady flow of any fluid. Viscosity or internal friction. Dimensional analysis and dynamic similarity. Part II, Applications in fluid mechanics: Flow of incompressible fluids in pipes. Fluid meters. Flow in curved path. Resistance of immersed bodies. Dynamic lift. Propulsion and craft [illegible]. General features of fluid machines. Turbines, fluid couplings, and fluid torque converters. Flow of liquids in open channels. Compressible flow. Compressible flow in pipes with friction. Fluid power and control systems. Lubrication. Unsteady flow and noise. Answers to problems. Index.

Note: Although in this book the part on applications is approximately two and one-half times the length of the part on basic [illegible], the book [is] not primarily [a] descriptive treatment of hydraulic machinery. It presents [a] well-balanced treatment in [which] the descriptions of applications are well integrated [with] the theory. It has been widely used in introductory courses in engineering colleges since the publication of the first edition in 1943.

BOYD JAMES E., AND PERCY W OTT
Mechanics a textbook for engineers. Third edition. New York McGraw Hill Book Company Inc., 1950. 422 p. illus. 24 cm. $6.00. 5288

Contents: Fundamental ideas. Concurrent, coplanar forces. Application of forces. Nonconcurrent, coplanar forces. Connected bodies. Graphical methods. Method of work. Concurrent, noncoplanar forces. Nonconcurrent, noncoplanar forces. Machines and friction. Flexible cables. Center of gravity. Moments of inertia. Kinematics and dynamics. Force and motion. Dynamics of rotation. Momentum. Harmonic vibration. Moving frames of reference. Some extracurry problems. Index.

Note: An engineering textbook designed for [a] course of about seven or eight semester hours. The book places emphasis on fundamental principles and includes many examples and problems to encourage the student in the application of the principles. Much of the material has been entirely rewritten for the third edition. New chapters include those on Method of work, Machines and friction, Flexible cables, and Moving frames of reference. The treatment of kinetics has been reorganized and rewritten, with emphasis upon strictly analytical methods. Throughout the text, new problems have been added, most of them more difficult than the original problems.

CADLE, R. D
Particle size determination. New York Interscience Publishers, Inc 1955 303 p. illus. 19 cm. $5.50. 5289

Contents: Introduction. Treatment of data. Sampling methods. Choice of technique for particle size determination. Optical microscopy. Electron microscopy. Sieve analysis. Sedimentation and elutriation. Surface area measurements. Optical methods. Miscellaneous methods. Index.

Note: One of the publisher's "Interscience manuals," this book provides [a] survey of methods of determining the sizes of particles ranging from those as large as grains of sand down to those so small that they can be viewed only by the electron microscope. The viewpoint [is] practical, and the book is addressed to scientists and technicians who are not experts in the subject. The early chapters deal with the general aspects of the problem, its significance, the statistical treatment of observed data, and criteria for selecting [a] size determination method for use in [a] specific situation. The remaining chapters deal with the chief techniques. These are named in the chapter titles quoted, except that the final chapter covers several less-important methods, such as electrostatic counting and methods based on sound waves. Although the methods selected for full treatment are adequately described, others are covered briefly with reference to other publications [where] fuller treatments are to be found.

CAMPBELL JOHN WILLIAM
An introduction to mechanics. New York Pitman Publishing Corporation 1947 372 p. illus. 24 cm. $4 75 5290

Contents: Rectilinear kinematics. Vector quantities. Plane kinematics. Particle dynamics. Centers of mass. Plane statics. Some properties of matter. Miscellaneous topics. Moments of inertia. Plane motion of [a] rigid body. Flexure and torsion. Kinematics of plane motion of rigid bodies. Further conditions for equilibrium. Flexible chains and cables. The general motion of [a] rigid body. Gravitation. Lagrange equations. Appendices: Principles of computation. Elementary calculus. Definite integrals. A useful reduction integral. Simpson's rule. Hyperbolic functions. Reckoning. Tables. Answers. Index.

Note: A textbook suitable for use in rigorous courses offered to students in engineering colleges. Mathematical methods involving the use of ordinary and [v]ector calculus are explained. Worked examples are incorporated in the text, and there are additional problems for students to solve. The author is Professor of Mathematics at the University of Alberta.

COX GLEN N AND WILLIAM G PLUMTREE
Engineering mechanics. Second edition. Princeton D Van Nostrand Company Inc. 1954 382 p. illus. 24 cm. $6 00. 5291

Contents: Fundamental concepts, definitions, and principles. Resultants of coplanar force systems. Equilibrium of coplanar force systems. Analysis of simple structures and flexible cables. Friction. Non-coplanar force systems. Centroids. Moments of inertia. Kinematics. Kinetics of rigid bodies—force-inertia method. Work, energy, and power. Impulse and momentum. Simple harmonic motion and mechanical vibrations. Index.

Note: A college textbook in [w]hich the exposition is carried forward largely in problems, including both solved problems included as examples and problems for the student to solve. The book is designed for use in the instruction of undergraduate students of engineering. The treatment assumes [a] knowledge of basic physics and mathematics through differential calculus. The arrangement is such that it may be studied concurrently with [a] course in integral calculus. The first edition was published in 1943 and was the work of the senior author alone. In preparing the second edition the authors rearranged the material, increased the number of topics covered, and added many new problems.

DALLA VALLE, JOSEPH MARIUS
Micromeritics the technology of fine particles. Second edition. New York Pitman Publishing Corporation 1948. 555 p. illus. 23 cm. $9 00. 5292

Contents: Principal symbols used in text and their units. Introduction. Dynamics of small particles. Shape and size-distribution of particles. Methods of particle-size measurement. Theory of sieving and grading of materials. Characteristics of packings. Behavior of particles under pressure. Diffusion of particles. Electrical, optical, and sonic properties. Thermodynamics of particles. Surface properties of particles. Chemical properties of small particles. Flow of fluids through packings. Imbibition and particle-moisture relationships. Capillarity. Determination of particle surface. Muds and slurries. Transport of particles. Dust clouds. Atmospheric and industrial dust. Collection and separation of particulate matter from air. Theory of fine grinding. Sampling. Selected bibliography. Appendices. Author index. Subject index.

Note: When the first edition of this book was published in 1943, it constituted the first important treatise on the behavior and physical properties of small particles larger than colloids. Again, it has been the author's purpose to provide fundamental information regarding particle-measurement, size-distribution, packing arrangements, and the application of this knowledge in such fields as soil and mineral physics, chemical engineering, geology, and hydrology. In this edition, several chapters have been revised, but the major change is the addition of the chapters that deal with the behavior of particles under pressure, particle dispersion by diffusion, surface properties of particles, dust and smoke clouds, and sampling techniques. The bibliography has been expanded from 38 to 43 pages.

DEN HARTOG JACOB PIETER
Mechanics. New York McGraw Hill Book Company Inc., 1948. 462 p. illus. 23 cm. $7.00. 5293

Contents. Discrete coplanar forces. Conditions of equilibrium. Distributed forces. Trusses and cables. Beams. Friction. Space forces. The method of work. Kinematics of a point. Dynamics of a particle. Kinematics of plane motion. Moments of inertia. Dynamics of plane motion. Work and energy Impulse and momentum. Relative motion. Gyroscopes. Problems. Answers to problems. List of equations. Index.

Note. A well-organized text designed for use in courses offered to sophomore or junior engineering college students. The treatment, although concise and to the point, is fuller and more advanced than that found in standard physics textbooks. Practical examples are freely used to illustrate basic principles and laws, and an unusually large number of problems and review exercises is included.

Faires, Virgil Moring, and Sherman Daniel Chambers

Analytic mechanics. Third edition. Problems in this edition revised by James Harvey Caddess New York The Macmillan Company, 1952 540 p. illus 24 cm. $6 25 5294

Contents Resultants and components. Coplanar concurrent forces. Moments and parallel coplanar forces. Non-concurrent, non-parallel, coplanar forces. Flexible cords. Friction. Graphical methods. Maximum and minimum forces. Non-coplanar forces. Centroids. Moments of inertia of areas. Moments of inertia of masses. Plane motion. Relative motion. Force systems that produce rectilinear motion. Curvilinear motion. Rotation and plane motion of rigid bodies. Work, kinetic energy power Impulse and momentum. Mechanical vibrations. Balancing rotating elements. Appendixes. Index.

Note In this text for college engineering courses, the authors have made a special effort to relate basic principles and theories to practical engineering problems. Numerous review problems of a practical nature are included, and illustrations and drawings are freely used to amplify the problems and the text proper This edition has undergone some rewriting further to clarify basic ideas, and many new problems have been added. Other changes include the addition of chapter on vibration, short discussions of gyroscopic action and dimensional analysis, and brief historical and biographical sketches.

Fairman, Seibert, and Chester S Cutshall

Engineering mechanics Second edition New York John Wiley & Sons, Inc., 1946 267 p illus. 24 cm. $4 50 5295

Contents Part I, Statics Introduction—General principles. Equilibrium of coplanar forces. Stresses and reactions in simple structures. Equilibrium of forces in space. Friction. Centroids and center of gravity Moment of inertia of area. Product of inertia of area—maximum and minimum moments of inertia. Moment of inertia of mass. Part II, Kinetics Rectilinear motion. Curvilinear motion and rotation. Work, energy and power Dynamics of rotating bodies. Plane motion. Impulse, momentum, and impact.

Note. An elementary textbook for engineering students who have studied calculus. Special note should be made of the explanation of the graphic method with the use of Bow's notation, the practical applications of the gyroscopic principle to ships, airplanes, etc., and the extended treatment of certain phases of plane motion. This edition is essentially the same as that of 1938 except for the division of one chapter the addition of the chapter entitled Production of Inertia of area, and the addition of new problems.

Girvin Harvey Frank

Applied mechanics. Second edition Scranton International Textbook Company 1949 417 p illus 24 cm. (International textbooks in civil engineering Benjamin A. Whisler consulting editor) $6 25 5296

Contents (abridged) Fundamental conceptions. Coplanar concurrent force systems. Coplanar parallel force systems. Coplanar nonconcurrent force systems by mathematical methods. Non-coplanar force systems by graphical methods. Flexible cables. Friction. Centroids and centers of gravity Kinematics of particle. Kinematics of a rigid body Rectilinear translation of rigid body Curvilinear motion. Rotation. Work, energy and power Plane motion of rigid body Impulse and momentum. Index.

Note A successful textbook for engineering college courses. Both mathematical and graphical methods of problem-solving are covered. Since numerous worked examples are included in the text, the book has some usefulness for study outside organized courses. No major changes were made in preparing this edition, but numerous minor additions and rearrangements were made. The number of problems to be worked by the student has been greatly extended. The type for the whole book was re-set. The new format is a considerable improvement over that of the first edition.

Green, Henry

Industrial rheology and rheological structures. New York John Wiley & Sons Inc., 1949 311 p illus 22 cm. $9 00 5297

Contents (abridged) Part I, A rheological system. Part II, The system applied to laboratory measurements. Part III, The particle—the basis of rheological structure. Part IV Particle groups rheological structures. Appendixes. Literature cited. Glossary Author index. Subject index.

Note In this work, the author describes a system used in his own laboratory that is based on use of multipoint consistency curve and is especially suited to practical use in industry The system is explained and is compared with other systems. Its practical applications together with the mathematical computations involved are covered thoroughly The work is addressed chiefly to technical personnel in industry who are concerned with processes where rheology of product is an important consideration.

Hall, Newman Arnold

Thermodynamics of fluid flow New York Prentice Hall, Inc., 1951 278 p. illus. 22 cm. $5 75 5298

Contents. Introduction. Fluid friction. Energy and continuity Momentum principles. Incompressible fluids. Perfect gases. Constant-area adiabatic flow Varying-area adiabatic flow Shock regions. Flow measurement and control. Diabatic flow Propulsion systems. Appendixes. Conversion tables. Mathematical notes. Thermodynamic partial derivatives. Tables. Index.

Note: The combination of fluid mechanics and fluid flow is presented in this textbook to enable the student to grasp the fundamentals necessary to the analysis of fluid flow an understanding of which is important in chemical, aeronautical, and mechanical engineering. While the book includes some review of both fluid mechanics and thermodynamics, the author assumes that the reader will already have received fundamental training in the two fields separately Theory is emphasized, with numerous examples showing the application of the theory in practical situations. Aside from its use as textbook, the book can also be of some use as a reference source for engineers concerned with research and development in fields dependent on flow systems.

Hunsaker, Jerome Clarke, and Brandon Garner Rightmire

Engineering applications of fluid mechanics. New York McGraw Hill Book Company, Inc. 1947 494 p illus. 23 cm. $7.50 5299

Contents Preface. Introductory survey Statics. Kinematics and continuity Dynamics of an ideal fluid. Energy relations for steady flow Momentum relations for steady flow Dimensional analysis and similitude. Incompressible flow in closed conduits. Compressibility phenomena. Drag. Wing theory Hydrodynamic lubrication. Boundary lubrication. Hydraulic turbines. Pumps, fans, and compressors. Propellers and jets. Fluid couplings and torque converters. Hydraulic transmissions and controls. Appendix. Problems. Index.

Note The authors have based this work on 12 years' experience in teaching fluid mechanics in undergraduate courses at the Massachusetts Institute of Technology It is frankly college textbook and furthermore is intended primarily for use in introductory courses that will be followed by more advanced ones. The fundamental principles and basic mathematical equations are treated rather extensively in the earlier chapters. In the later chapters, the design and performance of various devices that depend upon the mechanical behavior of liquids and gases under various conditions are analyzed. These range from lubricated bearings to "buzz bombs." Short lists of references for the guidance of students are appended to the chapters.

Engineering

Applied Mechanics

JENSEN, ALFRED

Applied engineering mechanics. New York McGraw Hill Book Company, Inc., 1947 316 p. illus. 23 cm. $4.00. 5300

Contents (abridged): Part I, Statics: Basic principles. Coplanar force systems. Non-coplanar force systems. Friction. Centroids and centers of gravity. Moments of inertia of areas. Part II, Dynamics: Kinematics of rectilinear motion. Kinetics of rectilinear motion. Kinematics of rotation. Kinetics of rotation. Curvilinear motion. Kinematics of rotation. Work, energy and power. Appendix: Centroids of areas by integration. Moments of inertia of plane areas. Moments of inertia of solid bodies. Variable acceleration. Derivation of the laws of motion. Index.

Note: An introductory text for use in vocational schools and first courses in engineering colleges. The simplicity of the treatment and the large number of practice problems make it suitable also for home study. Each section includes many examples and problems which show the application of the principles of mechanics to the solution of everyday engineering problems. Both analytical and graphical methods of solution are illustrated.

KARELITZ, GEORGE BORIS AND OTHERS

Problems in mechanics, based on the original collection of I. V. Mestchersky by G. B. Karelitz, J. Ormondroyd, and J. M. Garrelts. New York. The Macmillan Company 1939 271 p. illus. 23 cm. (Engineering science series edited by E. R. Hedrick) $6.00. 5301

Contents (abridged): Elements of mechanics. Statics. Kinematics. Dynamics (General). Problems—statics. Plane statics. Statics in space. Kinematics: Motion of a particle. Motion of a rigid body. Relative motion. Rotation of rigid bodies. Dynamics: Rectilinear motion. Curvilinear motion. Motion of rigid bodies. Work and energy. Impulse and momentum. Review problems in dynamics. Appendix: Table of units. Systems of units. Trigonometric functions.

Note: This collection of problems for advanced students of engineering is based on the original collection published by the late I. V. Mestchersky of the Polytechnic Institute of St. Petersburg. The original problems were reworded to suit American practice and units of measurement, and were supplemented by over 100 additional problems, making a total of 712 in all. Answers are given for the majority of them. A number of typical problems in each section are completely worked out to provide some guidance for the student in methods of approach and solution. A table of units and trigonometric functions is provided at the end of the book.

LEIGH, CHARLES WILBUR, AND JOHN FREDERIC MANGOLD

Practical mechanics and strength of materials. Third edition. New York McGraw Hill Book Company, Inc., 1940 498 p. illus. 19 cm. $5.50. 5302

Contents: The three simple stresses. Welded and riveted joints. Mechanical properties of materials. Resultant and equilibrium of forces. Parallel forces and moments. Static and kinetic friction. Concurrent, nonconcurrent coplanar forces. Nonconcurrent coplanar forces. Framed structures, roof and bridge trusses. Stability and center of gravity. Moment of inertia. Beams and beam design. Horizontal and vertical shear. Deflection, typical cases. Combined stresses, short columns. Indeterminate beams, concrete beams. Metal, timber, and concrete columns. Torsion, shafts and couplings. Appendixes—tables. Index. Answers.

Note: A presentation of the principles of mechanics and strength of materials, designed for short courses on the subject in night schools, vocational schools and colleges, and for the use of men in construction work. Emphasis is placed upon practical relations and equations. In the third edition, the text has been rewritten and expanded, new tables have been introduced dealing with trigonometry formulas and deflections, wide-flange beams, and unequal leg angles, and new problems have been provided.

MERIAM, J. L.

Mechanics. Part I, Statics. Part II, Dynamics. New York John Wiley & Sons, Inc., 1952 2 v. illus. 24 cm. Part I, $4.50; part II $4.50. 5303

Contents: Part I, Statics: Principles of mechanics. Force systems. Equilibrium. Structures. Distributed forces. Beams. Friction. Virtual work. Index. Part II, Dynamics: Kinematics. Principles of kinetics. Force, mass, and acceleration. Work and energy. Impulse and momentum. Periodic motion. Appendices: Moments of inertia. Useful tables. Index.

Note: Although divided into two parts for convenience, this text for beginning students is a compact treatment of a total of 471 pages of the theory and application of mechanics. The opening chapter on the principles of mechanics is repeated in both volumes, as are the appendixes. The exposition progresses from fundamentals to advanced theory with emphasis upon the importance of principles. An outstanding feature is the inclusion of a total of 1,371 practical problems, almost all of which are illustrated by line drawings of exceptional clarity and reality. *Solutions* are printed in full for one ... of the problems, and answers are given for many more.

MUHLENBRUCH, CARL W

Experimental mechanics and properties of materials. Second edition of *Testing of engineering materials*. Princeton D. Van Nostrand Company, Inc., 1955 243 p. illus. 23 cm. $4.00. 5304

Contents (abridged): Experimental mechanics and properties of materials. Conducting laboratory experiments and instructions for writing reports. Experiments. Appendix. Index.

Note: The 79 experiments included in this book illustrate the principles and variety of tests of engineering materials and the principles of ... The book is one of an equipment range of testing equipment. The book is planned for the guidance of undergraduate students of engineering taking laboratory courses in the mechanics and properties of materials.

MURPHY, GLENN

Mechanics of fluids. Second edition. Scranton International Textbook Company 1952 309 p. illus. 25 cm. (International textbooks in civil engineering. Benjamin A. Whisler consulting editor) $6.75 5305

Contents: Properties of fluids. Fluids at rest. Buoyant forces. Flow of fluids. Uniform flow. Nonuniform flow. Forces developed by fluids in motion. Hydraulic machinery. Similarity law. Appendixes. Index.

Note: In this introductory textbook basic principles underlying the behavior of fluids are presented for engineering students. Engineering applications are illustrated, and most of the problems pertain to such applications, but the emphasis is on the physical principles. Although about 20 pages shorter than the first edition published in 194-, material on such topics as torque converters and fluid couplings has been added. Several sections have been extensively rewritten.

PLETTA, DAN HENRY

Engineering statics and dynamics. New York The Ronald Press Company 1951 392 p. illus. 23 cm. (A volume of a series in engineering mechanics edited by Glenn Murphy) $6.00 5306

Contents: Statics: The scope and fundamental concepts of mechanics. The resolution and composition of force systems. Forces in equilibrium. Trusses, frames, and cables. Internal resistance of solid bodies. Centroids and moments of inertia. Dynamics, Part I, Kinematics: Motion of a particle. The motion of rigid bodies. Dynamics, Part II, Kinetics: Kinetics. Inertia forces. Work, energy, and power. Impulse, momentum, and impact. Vibrations. Dimensional analysis and model similarity. Appendix. Answers to problems. Index.

Note: A textbook intended for beginning courses in statics and dynamics. The general theory of each topic is presented first, and then the specific applications are considered. Descriptive matter is kept at a minimum, but many illustrative problems are presented. The author is of the Research Foundation at Virginia Polytechnic Institute.

ROUSE, HUNTER

Elementary mechanics of fluids. New York John Wiley & Sons, Inc., 1946 376 p illus. 22 cm. $5 50 5307

Contents. Introduction to the study of fluid motion. Fluid velocity and acceleration. Pressure variation in accelerated flow Effects of gravity on fluid motion. One-dimensional method of flow analysis. Effects of viscosity on fluid motion. Surface resistance. Form resistance. Lift and propulsion. Surface tension. The role of compressibility in fluid motion. Appendix. Mechanical properties of fluid matter Index.

Note Just as the mechanics of solids, originally taught as part of courses in classical physics, became of sufficient importance to warrant fuller treatment in separate courses in statics and dynamics, the mechanics of fluids is now a subject of courses distinct from courses in physics and even in hydraulics. This work on the fundamental principles and phenomena of the flow of liquids and gases has been written for use in such courses. It is intended primarily for engineering students ho have had courses in physics and calculus. It is also useful as compact and up-to-date guide for graduate engineers. The author is Director of the Iowa Institute of Hydraulic Research.

RUDINGER, GEORGE

Wave diagrams for nonsteady flow in ducts. New York D Van Nostrand Company, Inc., 1955 278 p illus 24 cm $6 50 5308

Contents Introduction. List of symbols. Fundamentals of wave diagram construction. The wave diagram. General flow problems. Boundaries and discontinuities. Interaction of discontinuities. Techniques of wave diagram construction. Examples. Bibliography Charts and tables. Appendix: Steady-flow relations. Index.

Note. The construction of wave diagrams is a simplified technique for analyzing the propagation of gas particles and pressure waves in systems of nonsteady gas flow Such analyses are necessary in number of fields of present-day engineering, including gas turbine design and combustion. This book is an introduction to the practical construction of such wave diagrams. The necessary simplifying assumptions are clearly indicated, the mathematical reasoning and drawing are expounded step by step, and methods of checking results are described. The bibliography contains a long list of books, articles and technical reports in which specific aspects are covered in more detail. The chapter entitled Charts and tables, contains 40 pages of data for ready reference. The book is useful to graduate physicists and engineers who are preparing to enter field of research or design where computations of nonsteady flow must be made. Graduate engineers already immersed in such work find the reference data useful. The author is Principal Physicist, Cornell Aeronautical Laboratory Inc.

SEELY, FRED B , AND NEWTON E ENSIGN

Analytical mechanics for engineers. Fourth edition New York John Wiley & Sons, Inc. 1952 443 p illus 22 cm 5309

Contents Part one, Statics Fundamental concepts and definitions. Resultants of force systems. Equilibrium of coplanar force systems. Equilibrium of trusses and cables. Equilibrium of non-coplanar force systems. Friction. Part two, Kinematics Motion of a particle. Motion of rigid bodies. Part three, Kinetics Force, mass, and acceleration. Work and energy Impulse and momentum. Part four Special topics Mechanical vibrations. Balancing. Appendix. First moments and centroids. Index.

Note. A college textbook in which physical principles are presented for the benefit of prospective engineers. The emphasis is on the principles, but engineering applications are indicated in the worked examples and in the problems for students to solve. Problems in equilibrium and in dynamics have been given special attention. The fifth edition was published in 1958, 475 p., $7.25.

SINGER, FERDINAND L

Engineering mechanics Second edition. New York Harper & Brothers, 1954 525 p illus. 24 cm. $6 50 5310

Contents Part I, Statics Principles of statics. Resultants of force systems. Equilibrium of force systems. Analysis of structures. Friction. Force systems in space. Centroids and centers of gravity Moments of inertia. Part II, Dynamics. Principles of dynamics. Rectilinear translation. Curvilinear translation. Rotation. Plane motion. Work and energy Impulse and momentum. Mechanical vibrations. Graphic methods. Index.

Note. An established introductory textbook for engineering college students. It offers a clear presentation of the fundamental principles of statics and dynamics and demonstrates their applications to problems in engineering. Calculus is used in the presentation, but there is also much use of graphic methods. The first edition was published in 1943. The level of presentation and the organization of the book are the same in this second edition, but the text has been extensively rewritten and somewhat enlarged. The number of problems for students to sol e has been increased to 1,721 As in the first edition, extensive use has been made of diagrams, and their numbers also have been substantially increased. The author is Associate Professor of Engineering Mechanics in the College of Engineering of New York University

STREETER, VICTOR LYLE

Fluid mechanics. New York McGraw Hill Book Company, Inc., 1951 366 p. illus. 24 cm $6 50 5311

Contents. Pressure intensity Static pressure forces. Fluid-flow concepts and basic equations. Action of fluid jets—turbomachinery Laminar flow Flow measurement. Steady flow in closed conduits. Flow in open channels. Flow around immersed bodies. Oil hydraulic systems. Appendixes. Physical properties of fluids. Partial derivatives and total differentials. Index.

Note. An elementary textbook for engineering students. It is supposed that the student ill have completed a course in integral calculus and at least two courses in engineering mechanics before undertaking the course of study in fluid mechanics. Explanations of the various new topics introduced are carefully presented on an elementary level and, in general, the elaborate treatment that the use of partial differentials would make possible has been avoided so that students may focus upon the fluid phenomena. A large number of problems, both of the numerical type and of the multiple-choice type, are printed at the end of each chapter and bibliographical calculus and at least two courses in engineering mechanics before references are given at the close of some of the chapters. The second edition was published in 1958, 480 p., $7.50.

TIMOSHENKO, STEPHEN, AND D H YOUNG

Advanced dynamics New York McGraw Hill Book Company, Inc., 1948 400 p illus. 23 cm $8.50 5312

Contents Dynamics of particle. Dynamics of system of particles. Dynamics of systems with constraints. Theory of small vibrations. Rotation of a rigid body about fixed point. Appendix: Dimensional analysis and theory of models. Index.

Note A textbook designed primarily for courses in advanced mechanics in engineering schools. It covers the more important methods of mathematical analysis that are valuable for the solution of such varied and complex problems in dynamics as vibration, engine balancing, the gyroscope and its applications, the rectilinear motion of rockets, and the motion of projectiles through the atmosphere. Approximate methods and rigorous methods of arriving at solutions are both demonstrated. Lagrangian equations are discussed at some length. The book should prove useful to graduate engineers as well as to students.

VENNARD, JOHN K.

Elementary fluid mechanics. Third edition New York John Wiley & Sons, Inc., 1954 401 p. illus. 22 cm. $5.50 5313

Contents Fundamentals. Fluid statics. Principles of one-dimensional flow Flow of an incompressible ideal fluid. Flow of compressible ideal fluid. The impulse-momentum principle. Flow of real fluid. Similarity and dimensional analysis. Fluid flow in pipes. Fluid flow in open channels. Fluid measurements. Fluid flow about immersed objects. Appendixes. Index.

Note A successful introductory textbook designed for the use of engineering college students who ha completed basic courses in mechanics and mathematics. Although mathematics is used in the exposition, physical concepts rather than mathematical analysis are emphasized. A broad though elementary iew of the field is presented. The author is Professor of Fluid Mechanics on the faculty of Stanford University

VIBRATION

BERNHARD RUDOLF KARL

Mechanical vibrations, theory and applications an introduction to practical dynamic engineering problems in the structural field. New York Pitman Publishing Corporation, 1943 139 p. illus. 23 cm. $3.50 5314

Contents: Introduction. General definitions. Observation of harmonic vibrations in simple phenomena. Clocks and measuring instrument considered as simple pendulum. Damping. Forced vibrations. Response of an instrument considered as result of forced vibrations. Calibration of mechanical instruments. Discussion of vibration phenomena due to forced vibrations. Coupled vibrations. Superposition of harmonic vibrations. Harmonic analysis. Resonance effect of girders. Magnitudes and limits of quantities to be measured. Requirements for measuring instruments. Sources of errors. Calibration of measuring instruments. Typical dynamic recording instruments. Other methods. Summary of practical applications. Bibliography. Index.

Note: An introduction for students and practicing engineers who have not studied dynamics. The book summarizes important facts and emphasizes experiments with simple models for easy visualization. Part [illegible] treats physical phenomena and their significance. Part II treats measuring techniques, typical dynamic measuring instruments, and dynamic testing methods.

CREDE, CHARLES E.

Vibration and shock isolation. New York John Wiley & Sons, Inc., 1951 328 p. 24 cm. $8.25 5315

Contents: Introduction. Isolation of vibration. Isolation of shock. Further considerations in vibration and shock isolation. Properties of materials and design of isolators. Particular applications of isolators. Index.

Note: A treatise covering both theory and practice in the use of resilient supports to protect machines and structures from vibration and shock. This subject is of interest to many engineers, ranging from those who design the relatively simple supports for automobile engines to those who are concerned with the installation of very heavy machines, such as punch presses. Most of the book is devoted [illegible] theory and fundamental considerations rather than to practical applications. It is addressed to graduate engineers and other persons who have equivalent backgrounds in mathematics, the fundamentals of mechanics, etc. Each chapter includes [illegible] selected list of literature references.

DEN HARTOG JACOB PIETER

Mechanical vibrations. Fourth edition. New York McGraw Hill Book Company Inc., 1956. 436 p. illus. 23 cm. $9 00 5316

Contents: Kinematics of vibration. The single-degree-of-freedom system. Two degrees of freedom. Many degrees of freedom. Multicylinder engines. Rotating machinery. Self-excited vibrations. Systems with variable or non-linear characteristics. Problems. Answers to problems. Appendix: A collection of formulas. Index.

Note: An introductory but rather comprehensive treatment of vibration theory and of means of controlling undesirable vibrations. It is used primarily as [illegible] textbook for the instruction of engineering college students and secondarily as [illegible] "refresher" for graduate engineers. The mathematics is simpler than might be expected, nevertheless, most situations discussed are analyzed mathematically. Much attention is given to the basic techniques of controlling vibrations of machinery and of structures to which machinery [illegible] attached. The fourth edition was published in 1947. Deletions and additions were made in all of the chapters in preparing this edition with the net result that the book has been shortened by almost thirty pages. The problems for students to solve are now segregated at the end of the book, and their number has been substantially increased.

HANSEN HOLGER M AND PAUL F CHENEA

Mechanics of vibration. New York John Wiley and Sons, Inc. 1952 417 p. illus. 24 cm. $8.00. 5317

Contents: General concepts. Part I, Systems of one degree of freedom. Free vibration [illegible] without damping. Forced vibrations without damping. Forced [illegible] vibrations [illegible] with damping. Part II, Systems of several degrees of freedom. Classical method. The mobility method and use of the complex variable. Solution of the general frequency equation. Part III, Special topics: Systems with distributed physical constants. Vibrations of transient character. Vibrations of [illegible] non-linear character. Problems. Answers to problems. Index.

Note: This work was developed from [illegible] course in [illegible] vibration analysis at the University of Michigan. It is introductory to the subject and is frankly [illegible] textbook. However in the third part the student is introduced to problems and methods that are typical of those in use in practical [illegible] vibration analysis in industry

MORSE, PHILIP M

Vibration and sound. Second edition. New York McGraw Hill Book Company Inc., 1948. 468 p. illus. 24 cm. (International series in pure and applied physics G P Harnwell, consulting editor advisory editorial committee E. U Condon and others) $7.50 5318

Contents: Introductory. The simple oscillator. The flexible string. The vibration of bars. Membranes and plates. Plane [illegible] waves of sound. The radiation and scattering of sound. Standing waves of sound. Bibliography. Glossary of symbols. Tables of functions. Index.

Note: An engineering college textbook [illegible] which is written at [illegible] level that makes it useful also to graduate physicists and engineers [illegible] be used as introduction to or [illegible] review of theory. It presents basic knowledge on vibration and on radiation of sound, with due attention to the associated mathematics. The first edition was published in 1936. Among other revisions, this second edition contains [illegible] more extensive treatment of radiation and of transient vibrations.

MYKLESTAD N O

Fundamentals of vibration analysis. New York McGraw Hill Book Company Inc. 1956 260 p. illus. 24 cm. $6.50. 5319

Contents: Fundamentals. Undamped vibrations of single-degree-of-freedom systems. Vibrations of single-degree-of-freedom systems with viscous damping. Systems of one degree of freedom with non-linear damping. Undamped vibrations of systems with more than one degree of freedom. Application of generalized coordinates. Damped vibrations of systems with more than one degree of freedom. Tabular methods for finding natural frequencies. Answers to problems. Index.

Note: A text designed as [illegible] first book of instruction in vibration analysis for advanced students of engineering and graduate students. The approach is classical and, as the title is intended to indicate, the emphasis [illegible] on fundamental phenomena and standard methods of analysis. The expository matter includes numerous worked examples, [illegible] feature that will be appreciated by the graduate engineer who tackles the book outside of [illegible] course. It is [illegible] successor to the author' *Vibration Analysis*, New York, 1944, and so much revision and augmentation has been made that it is fairly presented as new work.

TIMOSHENKO S

Vibration problems in engineering Third edition in *collaboration with* D H. Young. Princeton D Van Nostrand Company Inc., 1955 468 p. illus. 23 cm. $8 75 5320

Contents: Systems with one degree of freedom. Systems with non-linear and variable spring characteristics. Systems with two degrees of freedom. Systems with several degrees of freedom. Vibrations of elastic bodies. Author index. Subject index.

Note: A standard and widely used engineering college textbook. It develops the fundamental mechanical principles, explains methods of solving many practical engineering problems involving vibration, and provides numerous examples of calculations. The first edition was published in 1928 and the second edition in 1937. This third edition—the first to bear the name of [illegible] collaborating author —has been extensively revised; and the treatment of such topics as nonlinear vibrations and vibrations of elastic bodies have been rewritten. The former chapter on vibration measuring instruments has been deleted. New problems for students to solve have been added in various chapters.

HYDRAULICS

BAKHMETEV, BORIS ALEKSANDROVICH

Hydraulics of open channels. New York McGraw Hill Book Company, Inc., 1932 329 p. illus 23 cm (Engineering Societies monographs) $7 50 5321

Contents Part I, Theory of gradually varied flow. Part II, Practical applications. Part III, The hydraulic jump.

Note A comprehensive treatment of the more advanced features relating to flow of water in open channels, such as backwater and other surface curves, the hydraulic jump and other topics of varied flow.

CHURCH, AUSTIN H.

Centrifugal pumps and blowers. New York John Wiley & Sons, Inc., [illegible] 308 p illus, 22 cm $7 00. 5322

Contents Introduction. Principles of fluid flow. [illegible] pumps and blowers. Speeds, speed and efficiency of pumps. [illegible] mance curves and [illegible] of pumps. Design of radial-type pumps. Other pump impeller types. Pump details and materials. [illegible] applications and selection. Pump installation, operation, and test. Thermodynamic principles. Classification and performance curves of blowers. Design of radial-type blower stage. Construction details of blowers. Blower applications. Regulation of blowers. Blower installation, operation, and test. Disk stresses. Critical speeds. Index.

Note This book presents basic principles of design, construction, and application along conventional lines of practice. The treatment follows through the complete design of both a blower and a pump, including the design of the installation. The book incorporates many of the most important recent experimental results and data. For greater range in application, the data are applied to the average rather than specialized types of installation. Valuable charts, diagrams, and tables are included.

CREAGER, WILLIAM PITCHER, AND OTHERS

Hydroelectric handbook, by William P Creager and Joel D Justin with the assistance of contributors. Second edition. New York John Wiley & Sons, Inc., 1950 1 151 p. illus, 24 cm. $17 00 5323

Contents [illegible] Preliminary studies and economics. Rainfall. Factors affecting runoff. River gaging [illegible]. Flood flows. [illegible] Types of hydro plants [illegible] Hydraulics. Pondage and storage [illegible] dams. Earth dams. Timber dams and steel dams. Spillways and [illegible] Conduits and powerhouses. Intakes. Canals. Steel [illegible] Water hammer [illegible] Wood-stave pipe [illegible] Powerhouse superstructure [illegible] Hydraulic turbines [illegible] Index.

Note There are 44 chapters in this comprehensive work. [illegible]

[illegible] R L AND A C INGERSOLL

[illegible] mechanics with engineering applications. Fifth edition New York McGraw-Hill Company Inc., 1954 472 p illus [illegible] 5324

Contents Properties of fluids. [illegible] of fluid [illegible]

force and momentum. Similarity laws and factors for turbomachines. Impulse turbines. Reaction turbines. Centrifugal and axial flow pumps. Fluid couplings and torque converters. Basic hydrodynamics. Appendixes. Answers to problems. Index.

Note. Entitled *Hydraulics* in its first four editions, this book has been used in its various editions as a textbook in engineering colleges since 1916. It is designed to introduce the student to both theory and to practical applications. A broad view of the subject is presented, and the phenomena associated with both compressible and incompressible fluids are included, with, however, emphasis on those aspects of the field that are of interest to the hydraulic engineer. The fourth edition was published in 1937. This fifth edition is the first one in which authorship is shared with a co-author. The former chapter on water power plants has been deleted and much information added on various topics.

DAVIS, CALVIN VICTOR, editor

Handbook of applied hydraulics. Second edition. New York McGraw-Hill Book Company, Inc., 1952 1,272 p. illus. 24 cm. $15.00 5325

Contents: River regulation by reservoirs, by T. T. Knappen and others. Gravity dams, by C. V. Davis. Arch dams, by L. E. Houk. Buttress dams, by K. H. Burroughs. Earth dams, by T. T. Knappen and J. Lowe III. Rock-fill dams, by L. C. Steele. Spillways and stream-bed protection works, by E. W. Lane and C. V. Davis. Spillway crest gates, by J. S. Bowman and J. R. Bowman. High-pressure outlet works, by P. A. Kinzie. Canals, flumes, covered conduits, tunnels, and pipe lines, by J. Hinds. Hydroelectric plants, by J. C. Stevens and C. V. Davis. Hydraulic machinery by L. F. Moody. Water hammer by G. R. Rich. Surge tanks, by G. R. Rich. Speed regulation and governing stability by G. R. Rich. Navigation locks, by G. R. Rich. Irrigation, by I. E. Houk. Irrigation structures, by I. E. Houk. Water supplies, by T. R. Camp. Water distribution, by T. R. Camp. Water treatment, by T. R. Camp. Sewerage, by E. A. [illegible] and W. E. Stanley. Sewage-treatment hydraulics, by E. A. [illegible] and W. E. Stanley. Hydraulic models, by G. H. Hickox. [illegible] by P. Z. Kirpich. Appendixes: Hydraulic formulas, by [illegible]. Graphical aids to hydraulic computations, by K. E. [illegible].

[illegible] engineering handbook of the "easy" rather than [illegible] type. Although the pertinent formulas and the expected data are present, they are subordinated to an expository [illegible] designed to be read. In many of the sections, fundamentals and their practical applications are presented by [illegible] engineering features of representative projects already [illegible] this edition much of the original edition was re[illegible]. Sections on water hammer, surge tanks, and speed regulation have been added. The expanded [illegible] those on gravity dams and hydroelectric plants. [illegible] formulas and graphical aids are also newly added.

[illegible]UDREY

[illegible]l of estimating stream flow [illegible] evaporation formula. Wash-

ington, D. C. Carnegie Institution of Washington, 1950. 237 p. illus. 20 cm. (Carnegie Institution of Washington. Publication no. 400) o.p. 5327

Contents (abridged): Part I, A new evaporation formula. Final form of observation equations used for determining evaporation. Extent of computation of known quantities. Principal facts from the use of evaporation tables. Summary of general conclusions. Appendix. Tables. Part II, A new method of estimating stream-flow. Form of observation equations. Method of converting constants of stream-flow formulas to percentages. Examples of computation. Tests of overall accuracy of computed stream-flow. General résumé of theory. Appendices. Tables. Index.

Note: A summary of the research made by the author and J. F. Hayford into the laws governing the amount of stream-flow, and its application for the engineering profession of new data for use in developing new waters for power, flood control, etc.

IOWA. STATE UNIVERSITY. INSTITUTE OF HYDRAULIC RESEARCH

Engineering hydraulics: proceedings of the fourth Hydraulic Conference, June 12–15, 1949. Edited by Hunter Rouse. New York, John Wiley & Sons, Inc., 1950. 1,039 p. illus. 24 cm. $15.75 5328

Contents: Fundamental principles of flow, by H. Rouse. Hydraulic similitude, by J. S. Warnock. Flow measurement, by J. W. Howe. Hydrology, by G. R. Williams. Flow of ground water, by C. E. Jacob. Steady flow in pipes and conduits, by V. L. Streeter. Surges and water hammer, by J. S. McNown. Channel transitions and controls, by A. T. Ippen. Gradually varied channel flow, by C. J. Posey. Flood routing, by B. R. Gilcrest. Wave motion, by G. H. Keulegan. Sediment transportation, by C. B. Brown. Hydraulic machinery, by J. W. Daily. Appendix: List of symbols. Dimensional considerations. Properties of common fluids. Author index. Subject index.

Note: A comprehensive treatise in which the emphasis is on the principles and basic techniques of hydraulic engineering rather than specialized applications. The work was planned as a whole by the staff of the Iowa Institute of Hydraulic Research, and each of the 13 subdivisions into which the main subject was divided was assigned to an outstanding authority. The manuscripts prepared by the 13 authors were edited and correlated, then issued in preprint form to the registrants for the fourth Hydraulics Conference sponsored by the Institute. This conference was devoted to criticism and discussion of the manuscripts. Finally, all of the chapters were revised in the light of the experts' criticisms. The final result is a book that should take its place as the basic volume in any library collection on hydraulic engineering.

KING, HORACE WILLIAMS

Handbook of hydraulics, for the solution of hydraulic problems. Revised by Ernest F. Brater. Fourth edition. New York, McGraw-Hill Book Company, Inc., 1954. illus. 19 cm. $8.00. 5329

Contents (abridged): Section I, Fluid properties and hydrostatics. Section II, Hydrodynamics. Section III, Orifices, gates, and tubes. Section IV, Sharp-crested weirs. Section V, Weirs not sharp crested. Section VI, Pipes. Section VII, Open channels with uniform flow. Section VIII, Open channels with nonuniform flow. Section IX, Measurement of flowing water. Section X, Tables. Index.

Note: A standard reference book used by advanced undergraduate students of engineering and graduate engineers alike. It provides in concise form the range of information on basic principles, definitions of terms, formulas, and computations. There are numerous tables and graphical representations of data and 67-page section of tables of logarithms, squares, cubes, reciprocals, etc. The third edition was published in 1939. Numerous useful revisions and amendments were made in preparing this fourth edition, the first to bear the name of a second author.

KING, HORACE WILLIAMS, AND OTHERS

Hydraulics, by Horace W. King, Chester O. Wisler and James G. Woodburn. Fifth edition. New York, John Wiley & Sons, Inc., 1948. 351 p. illus. 22 cm. $5.00. 5330

Contents: Fundamental properties of fluids. Principles of hydrostatic pressure. Hydrostatic pressure on surfaces. Relative equilibrium of liquids. Fundamentals of fluid flow. Orifices, tubes, and weirs. Pipes. Open channels. Hydrodynamics. Hydraulic similitude and dimensional analysis. Answers. Index.

Note: An introductory exposition of fundamental principles and of selected engineering applications. It is used chiefly as an undergraduate textbook, but is useful also as a concise review for practicing engineers who are not specialists in this field. A considerable amount of revision is apparent in this edition. The chapter on hydraulic similitude and dimensional analysis, which has pertinence to the use of models in hydraulic engineering design, has been added.

KING, HORACE WILLIAMS

Manning formula table, for the solution of pipe problems: giving diameters in inches corresponding to different rates of loss of head and different degrees of roughness of pipe surfaces. New York, McGraw-Hill Book Company, Inc., 1937. 351 p. 23 cm. $3.50. 5331

Note: Presented in this volume is a tabular solution of the Manning formula throughout the range of conditions ordinarily encountered by engineers in pipe problems. The values given are applicable to all circular conduits flowing full, including sewer pipe and drain tile. Volume two, which contained a similar table covering flow in open channels, is out of print.

KRISTAL, FRANK A., AND F. A. ANNETT

Pumps: types, selection, installation, operations, and maintenance. Second edition. New York, McGraw-Hill Book Company, 1953. 373 p. illus. 24 cm. $6.50 5332

Contents: Reciprocating pumps. Volute-type centrifugal pumps. Diffuser-type centrifugal pumps. Turbine pumps. Propeller pumps. Rotary pumps. Deep-well pumps. Boiler-feed pumps. Sewage and sludge pumps. Sanitary pumps. Variable displacement and proportioning pumps. Methods of priming pumps. What is head on pumps? Economical pipe size for pumps. Pump operation. Pump selection, installation, and operation. Centrifugal-pump troubles and remedies. Appendix: Tables and data. Index.

Note: A book containing both general and specific information and addressed to industrial, chemical and sanitary engineers, and others who are concerned with the selection or operation of pumps. All of the principal types of pumps are described as to operating principles, characteristics, uses, etc. Although small pumps, such as are used in farm water supply systems, are included, most of the space is given, as might be expected, to industrial pumps. The first edition was published in 1940. In this second edition, the scope and arrangement are unchanged. A considerable portion of the text and illustrations has been carried over from the first edition. However, a chapter has been added on pumps used in food processing, and there are newly added sections in other chapters on such topics as jet pumps, mechanical seals, regenerative turbine pumps, sewage pumps and pump pricing. There are now 417 figures, and these include many diagrams of pump mechanisms.

McCLAIN, CLIFFORD HENDERSON

Fluid flow in pipes. A clear-cut summary of modern theory in the flow of liquids and gases through piping and ducts, with practical applications and detailed worked-out examples. New York, The Industrial Press, Inc., 1952. 123 p. 24 cm. $3.00. 5333

Contents: Dimensions of fluid properties. Viscosity of fluids. Effect of piping on fluid flow. Design practice.

Note: In this book the basic phenomena and theory are covered rather thoroughly from the standpoint of design of industrial piping systems. Though much of the exposition is expressed mathematically, the mathematics is simple. Twenty worked examples are included at appropriate points to assist the reader who studies the book by himself.

HYDRAULICS

BAKHMETEV, BORIS ALEKSANDROVICH
Hydraulics of open channels New York McGraw Hill Book Company, Inc., 1932 329 p illus 23 cm (Engineering Societies monographs) $7 50 5321

Contents Part I, Theory of gradually varied flow Part II, Practical applications. Part III, The hydraulic jump.
Note. A comprehensive treatment of the more advanced features relating to flow of water in open channels, such as back water and other surface curves, the hydraulic jump and other topics of varied flow

CHURCH, AUSTIN H.
Centrifugal pumps and blowers New York John Wiley & Sons, Inc., 1944 308 p illus. 22 cm. $7 00 5322

Contents Introduction. Principles of fluid flow Basic theory of pumps and blowers. Specific speed and efficiency of pumps. Performance curves and cavitation of pumps. Design of radial-type pump stage. Other pump impeller types. Pump details and materials. Pump applications and selection. Pump installation, operation, and test. Thermodynamic principles. Classification and performance curves of blowers. Design of radial-type blower stage. Construction details of blowers. Blower applications. Regulation of blowers. Blower installation, operation, and test. Disk stresses. Critical speeds. Index.
Note This book presents basic principles of design construction, and application along conventional lines of practice. The treatment follows through the complete design of both blower and pump, including the design of the installation. The book incorporates many of the most important recent experimental results and data. For greater range in application, the data are applied to the average rather than to specialized types of installation. Valuable charts, diagrams, and tables are supplied.

CREAGER, WILLIAM PITCHER, AND OTHERS
Hydroelectric handbook, by William P Creager and Joel D Justin, with the assistance of contributors. Second edition New York John Wiley & Sons, Inc., 1950 1 151 p illus. 24 cm $17 00 5323

Contents (abridged) Preliminary studies and economics Rainfall. Factors affecting runoff River gaging, by N C. Grover and J C. Hoyt. Flood flows. Investigation of sites. Hydraulics. Pondage and storage. Types of hydro plants. Cost of steam power Cost of hydro power Dams—design and construction. Solid gravity concrete dams. Arch dams. Earth dams. Timber dams and steel dams. Spillways and headwater control. Conduits and powerhouses Intakes. Canals. Steel pipe, by C. H. Scheman and H. C Boardman Wood-stave pipe by B. E. White. Water hammer by E. B. Strowger Powerhouse substructure. Powerhouse superstructure, by J H. Gandolfo. Equipment and operation Hydraulic turbines, by Arnold Pfau and W M. White. Electrical design, by R A. Hopkins. Operation of hydroelectric plants, by A. Davis. Index.
Note There are 44 chapters in this comprehensive work. Each chapter is condensed technical essay on its title subject and is, in most cases, supplemented by bibliography of the useful technical literature. The book is standard one for practicing engineers and is especially useful to those members of the profession who have not specialized in hydroelectric engineering but are beginning t ork with the construction or operation of hydroelectric plants. The first edition was published in 1927 and as 897 pages in length. The greater part of the material in the second edition is new

DAUGHERTY R L AND A. C INGERSOLL
Fluid mechanics with engineering applications Fifth edition New York McGraw Hill Book Company Inc 1954 472 p illus. 24 cm $7 00 5324

Contents Properties of fluids. Pressure. Hydrostatic force on areas. Kinematics of fluid flow Dynamics of fluid flow Similitude of fluid flow Flow measurement. Friction losses in pipes Flow through pipes. Uniform flow in open channels. Nonuniform flow in open channels. Unsteady flow Forces on immersed bodies. Dynamic force and momentum. Similarity laws and factors for turbomachines. Impulse turbines. Reaction turbines. Centrifugal and axial-flow pumps. Fluid couplings and torque converters. Basic hydrodynamics. Appendixes. Answers to problems. Index.
Note. Entitled *Hydraulics* in its first four editions, the book has been used in its various editions as a textbook in engineering colleges since 1916. It is designed to introduce the student to basic theory and to practical applications. A broad view of the subject is presented, and the phenomena associated with both compressible and incompressible fluids are included, with, however, emphasis on those aspects of the field that are of interest to the hydraulic engineer The fourth edition was published in 1937 This fifth edition is the first one in which authorship is shared with a co-author The former chapter on water power plants has been deleted and much information added on various topics.

DAVIS, CALVIN VICTOR, editor
Handbook of applied hydraulics. Second edition New York McGraw Hill Book Company, Inc., 1952 1,272 p. illus. 24 cm. $15.00. 5325

Contents. River regulation by reservoirs, by T T. Knappen and others. Gravity dams, by C. V Davis. Arch dams, by L E. Hauk. Buttress dams, by E. H. Burroughs. Earth dams, by T T. Knappen and J Lowe III. Rock-fill dams, by L C. Steele. Spillways and stream-bed protection works, by E. W Lane and C. V Davis. Spillway crest gates, by J S. Bowman and J R. Bowman. High-pressure outlet works, by P A. Kinzie. Canals, flumes, covered conduits, tunnels, and pipe lines, by J Hinds. Hydroelectric plants, by J. C Stevens and C. V Davis. Hydraulic machinery by L. F Moody. Water hammer by G. R. Rich. Surge tanks, by G. R. Rich. Speed regulation and governing stability by G. R. Rich. Navigation locks, by G. R. Rich. Irrigation, by L E. Houk. Irrigation structures, by I. E. Houk. Water supplies, by T R. Camp. Water distribution, by T R. Camp. Water treatment, by T R. Camp. Sewerage, by S. A. Greeley and W E. Stanley Sewage-treatment hydraulics, by S. A. Greeley and W E. Stanley Hydraulic models, by G. H. Hickox. Hydrology by P Z. Kirpich. Appendixes: Hydraulic formulas, by W L. Voorduin. Graphical aids to hydraulic computations, by K. E. Sorensen. Index.
Note. A standard engineering handbook of the "essay" rather than the "table" type. Although the pertinent formulas and the especial collections of data are present, they are subordinated to an expository text which is designed to be read. In many of the sections, fundamental principles and their practical applications are presented by describing the engineering features of representative projects already constructed. For this edition much of the original edition was rewritten or augmented. Sections on water hammer, surge tanks, navigation locks, and speed regulation have been added. The expanded discussions include those on gravity dams and hydroelectric plants. The appendixes on formulas and graphical aids are also newly added.

EINSTEIN, HANS ALBERT
The bed load function for sediment transportation in open channel flows. Washington, D C Government Printing Office, 1950. 71 p illus. 23 cm (United States. Department of Agriculture. Technical bulletin no. 1026) 5326 o p

Contents. Introduction Approach to the problem. Limitation of the bed-load function. Hydraulics of the alluvial channel. Suspension. Integration of the suspended load. Limit of suspension. Practical calculation of suspended load. Bed-load concept. The bed-load equation. Transition between bed load and suspended load. The necessary graphs. Flume tests with sediment mixtures. Sample calculation of river reach. Limitations of the method. Summary Literature cited. Appendix List of symbols. Work Charts.
Note A method for determining the bed-load function for many but not all types of stream channels is described in this pamphlet. The method permits measure of prediction of future channel changes, important in the prevention of bed erosion, which may be caused by improvements such as dams or other projects altering the flow of the stream and which, if severe, may lead to the undermining of costly installations, bridge piers, sewer outlets, and bank protection works. The illustrative material includes some folded two-color work charts in pocket.

FOLSE JULIUS AUDREY
A new method of estimating stream-flow, based upon a new evaporation formula. Wash

STEPANOFF, ALEXEY JOAKIM

Turboblowers theory design and application of centrifugal and axial flow compressors and fans. New York John Wiley and Sons Inc., 1955 377 p. illus. 24 cm. $8.00. 5340

Contents: Selected topics from fluid mechanics. Definitions and terminology. Theory of the centrifugal impeller for incompressible fluid. Vortex theory of Euler's head for incompressible fluid. General characteristics of turbomachinery—incompressible fluid. Hydraulic performance of centrifugal blowers. Thermodynamics of turboblowers. Special problems, thermodynamic and hydrodynamic. Power curves. Leakage, disk friction, and mechanical losses—axial thrust. Compression with cooling. Centrifugal fans. Axial flow fans and blowers, single stage. High pressure multistage axial flow compressors. Special problems and application of blowers and compressors. Design of mixed flow impellers. Index.

Note: Despite the subtitle of this book, it deals primarily with theory and design. The single chapter on applications is short and devoted chiefly to illustrations of how specific design problems have been solved in commercially developed machines. Actually the book is largely devoted to the handling of hydrodynamic and thermodynamic problems in design. Using the concept of "available energy" the author has treated the analysis of design problems specifically and in detail and has outlined practical design procedures. References are included to both American and European literature. The author is a member of the engineering staff of the Ingersoll Rand Corporation.

UNITED STATES BUREAU OF RECLAMATION

Hydraulic and excavation tables. Tenth edition. Washington, D C. Government Printing Office, 1950. 173 p. 18 cm. 5341

Note: Compiled originally for the official use of the engineers of the Bureau of Reclamation, this manual of tables has proved to be useful to other engineers concerned with projects involving hydraulics and earth moving. Most of the 34 tables were computed for this publication. Earlier editions appeared in 1905, 1910, 1913, 1917, 1921, 1924, 1935, 1940, and 1946, and the number of tables has gradually increased from 13 to the present 34. The seventh edition containing 31 tables was published in 1937 330 p. $2.00.

WOODWARD SHERMAN MELVILLE, AND CHESLEY J POSEY

Hydraulics of steady flow in open channels. New York John Wiley and Sons, Inc., 1941 151 p. illus. 23 cm. $4 75 5342

Contents: Introduction. Bernoulli's theorem applied to frictionless rectangular open channel. The stationary hydraulic jump in channels of rectangular cross section. Criteria of flow and the hydraulic jump in channels of non-rectangular cross section. The moving hydraulic jump. Backwater curves—introductory. Back-water curves in uniform channel. Analysis of flow problems. Step methods for backwater curves. Bends, transitions, and obstructions. Steady varied flow. Index.

Note: The language in this book is succinct, and the treatment is simple. Terms are clearly stated and defined. Basic hydraulics of open channel flow are clearly developed and illustrated. The results of much research, never before published, are included. New and convenient tables for solving uniform flow problems by Manning's formula are given. The important methods for computing backwater curves are described and classified with respect to their relative merits for different types of problems. A treatment of flow around bends and through obstructions such as bridge piers is included. The textual material is completed by many practical illustrative problems, and there are additional problems with which the reader can test his grasp of the material.

ENGINEERING MATERIALS

AMERICAN SOCIETY FOR METALS

Interpretation of tests and correlation with service a series of four educational lectures presented to members of the ASM during the thirty-second National Metal Congress and Exposition, Chicago October 23 to 27 1950 Cleveland The American Society for Metals, 1951 198 p. illus. 24 cm. $5.00 5343

Contents. Correlation of laboratory tests and service performance, by M. F Garwood and others. Limitations of mechanical testing, by M. Gensamer. Wear tests and service performance, by J T Burwell. Corrosion tests and service performance, by F L. LaQue. Index.

Note: The papers in this book relate to the very important topic of correlations between laboratory tests and service performance. For example, in the first paper there are reports of detailed investigations of automobile steering knuckles, front suspension coil springs, and axle shafts. The lectures were addressed to professional metallurgists, but they are also of interest to mechanical engineers concerned with the design of machine parts. Each of the papers is accompanied by a list of references.

AMERICAN SOCIETY FOR TESTING MATERIALS

ASTM standards on plastics. Sponsored by ASTM Committee D 20 on Plastics. Specifications, methods of testing, nomenclature definitions. Philadelphia American Society for Testing Materials, 1955 786 p illus. 23 cm. $5 75 5344

Contents (abridged) Specifications for plastics. Strength properties of plastics. Hardness properties of plastics. Thermal properties of plastics. Optical properties of plastics. Permanence properties of plastics. Analytical methods for plastics. Molds and molding processes for plastics. Definitions and nomenclature of plastics. Conditioning of plastics. Electrical tests. Plates, sheets, tubes, rods, and molded materials. Miscellaneous subjects. Appendices.

Note: A collection of the specifications for and methods of testing plastic materials, which have been developed by the American Society for Testing Materials. It includes both specifications accepted as standard and tentative specifications. The volume is typical of the special collections of specifications available from the Society in contrast to their comprehensive *Book of ASTM standards*, described above.

AMERICAN SOCIETY FOR TESTING MATERIALS

1955 book of ASTM standards including tentatives. (A triennial publication) Philadelphia American Society for Testing Materials 1955 1 vol. in 7 parts. illus. 23 cm. Part 1 $13.50 part 2 $11.00 part 3 $13.50 part 4 $11 00 part 5 $11.00 part 6 $13 00 part 7 $11 00. 5345

Contents (abridged) Part 1 *Ferrous metals.* Part 2 *Non-ferrous metals.* Part 3 Cement, concrete, ceramics, thermal insulation, road materials, waterproofing, soils. Part 4 Paint, naval stores, cellulose, wax polishes, wood, acoustical materials, sandwich and building constructions, fire tests. Part 5 Fuels, petroleum, aromatic hydrocarbons, engine antifreezes. Part 6 Plastics, electrical insulation, rubber electronic materials. Part 7 Textiles, soap, water, paper, adhesives, shipping containers, atmosphere analysis.

Note: Formally adopted ASTM standards, ASTM tentative specifications, methods of tests, and definitions are all included in this collection, which is issued every three years. Each of the volumes (called parts by the publisher) contains approximately 1800 pages and has its own index. However, a combined index is issued by the publisher. Annual supplements to the triennial collection are available from the same publisher.

AMERICAN SOCIETY FOR TESTING MATERIALS

Selected ASTM engineering materials standards for use in college curricula. Philadelphia American Society for Testing Materials, 1956 354 p. illus. 22 cm. $4.00. 5346

Contents (abridged) Factors and principles of specifications, by C. D. Dudley. Legal aspects of standardization, by R. R. Irvine. *List of standards by materials:* Steel. Iron. Aluminum. Copper and

PARMAKIAN, JOHN

Waterhammer analysis. Published under the sponsorship of Allis-Chalmers Manufacturing Company [and other companies] New York Prentice-Hall, Inc., 1955 161 p illus. 24 cm. $4 90 5334

Contents Rigid water column theory Elastic water column theory Velocity of waterhammer waves. Waterhammer wave reflection. Waterhammer for rapid gate movements. Waterhammer for slow gate movements. Theory of graphical waterhammer analysis for gate operation. Waterhammer produced by gate closure. Waterhammer produced by gate opening. Waterhammer for uniform gate operation. Waterhammer in pump discharge lines caused by power failure. Special waterhammer solutions for pump discharge lines. Waterhammer solutions for pump discharge lines. Waterhammer analyses including effect of hydraulic losses. Waterhammer analysis for compound pipes. Approximate methods of graphical waterhammer analysis. Discharge characteristics of gates and valves. Surge tanks. Air chambers at pumping plants. References. Problems. Index.

Note. The term "waterhammer" describes a class of transient phenomena which occur in hydraulic systems and which must be controlled by correct design of the system so as to avoid undesirable consequences. The average citizen encounters waterhammer in the form of a sharp thump when a faucet is closed too suddenly in a plumbing system. However it is much more complex problem to the designer of for instance, a municipal pumping station. This book presents systematic method of analyzing waterhammer problems. The two basic theories are described and a group of "fundamental waterhammer equations" are derived. Waterhammer problems presented by variety of systems and conditions are analyzed. Charts designed to shorten the necessary computations are included.

POWELL, RALPH WATERBURY

An elementary text in hydraulics and fluid mechanics A revision of *Mechanics of liquids* New York The Macmillan Company, 1951 316 p illus 22 cm $5.50 5335

Contents Hydrostatics. Fundamentals of fluid flow Orifices, tubes, nozzles, and weirs. Pipe flow Flow in open channels. Further effects of viscosity surface tension, and compressibility Models. Appendixes Properties of liquids, with tables. Dimensional analysis. Rational basis for pipe formulas. Stream gaging. Index.

Note A textbook designed for use in engineering colleges. Appropriately it pays due attention to the historical development of the subject and emphasizes principles. However both the examples that are worked in the exposition and the problems for the student to solve illustrate concrete applications in engineering. Some reorganization and considerable revision have been put into the present edition. The major addition is the chapter on hydraulic models.

RICH, GEORGE ROLLO

Hydraulic transients New York McGraw Hill Book Company, Inc. 1951 260 p illus 24 cm (Engineering Societies monographs Ralph H Phelps consulting editor) $7 50 5336

Content Water hammer Turbine speed regulation. Stability of governing Water-hammer pressures in pump discharge lines. The differential surge tank. The restricted-orifice surge tank Navigation locks. Surges in power canals—tidal harmonics Elements of the graphical method of water-hammer analysis. Index

Note An engineering college textbook applying arithmetic integration and trial-and-error arithmetic to practical problems in water hammer surge-tank design, turbine-speed regulation, stability of governing, pressures in pump discharge lines, filling systems for navigation locks, and surges in open canals. In few cases where the development of theory requires the solution of partial differential equations, the author has employed the complex operational calculus, explaining that the reader not familiar with the method may take this small amount of routine mathematics for granted without any impairment of the general usefulness of the book in practical computation. The author states his opinion that no method exceeds the arithmetic-integration process in simplicity and directness or affords so clear an insight into the physical action at all stages of the cycle. Bibliographical references appear at the ends of the chapters.

SHEPHERD, D G

Principles of turbomachinery New York The Macmillan Company, 1956 463 p. illus. 24 cm. $10 00. 5337

Contents Introduction. Dimensional analysis. Energy transfer between fluid and a rotor Thermodynamics of gas flow Flow of fluids in turbomachines. Centrifugal pumps and compressors. Radial-flow turbines. Axial-flow turbines. Performance of turbines and comparison of types. Axial-flow compressors and pumps. Performance of compressors and pumps and comparison of types. Name index. Subject index.

Note. An analytical exposition of the principles of turbomachines that is to say machines in which the fluid is not positively contained but is continually in steady flow through the machine, undergoing changes of pressure primarily by means of dynamic effects." All the classes and varieties of turbines are considered, as well as those kinds of rotary pumps and compressors to which this definition applies. The basic similarity of turbomachines is emphasized, and the first five chapters are devoted to principles and relationships common to all. In the six following chapters, rather detailed analyses of the chief kinds of turbo machines are presented. The author is Professor of Mechanical Engineering in Cornell University and the book is primarily text for use in engineering college courses. Graduate engineers not specializing in this field but needing information about it should find the book useful as a survey and guide to the significant literature.

STEARNS, REID F, AND OTHERS

Flow measurement with orifice meters, by Reid F Stearns, Russell R. Johnson, Robert M Jackson and Charles A. Larson. New York D Van Nostrand Company, Inc., 1951 350 p. illus 26 cm. $8 00 5338

Content (abridged) Introduction. Derivation of flow equations. Applications of flow equations to metering problems. Evaluation of variable terms in flow equations. Principles of operation of commercial meters. Interpretation of meter records. Orifice meter installations. Testing and checking meters. Special metering problems. Accuracy of orifice meter installations. Appendixes. Supplemental metering information. Numerical data. Physical data. Bibliography. Index.

Note A comprehensive manual of the use of orifice meters for the measurement of the flow of fluids including gas, steam, water, oil and chemicals in pipes and other closed conduits. It has been written by four engineers associated with the Standard Oil Development Company and it is addressed primarily to chemical engineers at work in industry Such aspects of the general subject as selection of orifice sizes, types of differential meters, installation of meters, the keeping and interpretation of meter records, and estimations of accuracy are discussed fully The book abounds in graphs and tables designed to facilitate its use by engineers who are not meter specialists.

STEPANOFF, ALEXEY JOAKIM

Centrifugal and axial flow pumps theory design and application. New York John Wiley & Sons, Inc., 1948 428 p illus 23 cm. $9 75 5339

Contents Selected topics from hydraulics. Definitions and terminology Theory of the centrifugal pump impeller Vortex theory of Euler's head. Specific speed and design constants. Design of mixed flow impellers for centrifugal pumps. Pump casing. Axial flow pumps. Hydraulic performance of centrifugal pumps Leakage, disk friction, and mechanical losses. Axial thrust. Cavitation in centrifugal pumps. Special operating conditions of centrifugal pumps. Special problems of pumps design and application. Shaft design for critical speeds. Special problems and applications of vertical turbine and axial flow pumps. Special problems and applications of centrifugal pumps. Centrifugal-jet pump water systems Index

Note: This text, written for hydraulic engineers and advanced students, provides a detailed discussion of the basic principles of the subject. Theoretical aspects are closely interwoven with practical descriptions of the steps to be followed in designing pump parts and discussions of the behavior of centrifugal pumps under varying conditions. Many of the problems discussed had their origin in the new uses to which such pumps have been put in recent years, and constant reference is made to experimental studies carried out in connection with cavitation, axial and radial thrust, control of head-capacity brake-horsepower curves, etc. A second edition was published in 1957 462 p $12.00.

provides an alphabetical key to all the commodities. A supplement has been published as follows: P. A. Cooley. *Supplement 1. National directory of commodity specifications*, Washington, D. C.: Government Printing Office, 1947 [illegible] p. $2.25.

COWDREY IRVING H. AND EDWARD L BARTHOLOMEW, JR.

Introductory engineering materials. New York McGraw Hill Book Company Inc., 1953 424 p. illus. 22 cm. $6 00 5352

Contents: Testing. Wood. Stone. Brick. Cementing materials. Cement and concrete. Plastics. Irons, steels, and cast irons. Heat treatment of steel. Mechanical forming. Casting and welding. Alloy steels. The light metals and their alloys. Copper and its alloys. The special-purpose nonferrous alloys. Suggested reading. Motion pictures and filmstrips. Index.

Note. The authors of this elementary text have done a good job of describing, with a minimum of mathematics, a number of basic materials, showing why and how they are used in engineering. The book is illustrated with well-chosen photographs, and in the metals section, with photomicrographs. The presentation is logical throughout, and the style is a good example of unlabored technical writing, easy to read and to comprehend.

DAVIS HARMER E., AND OTHERS

The testing and inspection of engineering materials. Second edition. By Harmer E. Davis, George Earl Troxell and Clement T Wiskocil. New York McGraw Hill Book Company Inc., 1955 431 p. illus. 24 cm. (McGraw-Hill series in civil engineering Harmer E. Davis, consulting editor) $6 50. 5353

Contents (abridged): Part 1. Principles of testing and inspection. The nature of the problem. General features of mechanical testing. Measurement of load, length, and deformation—common testing apparatus. Static tension and compression tests. Static shear and bending tests. Hardness tests. Impact tests. Fatigue and creep tests of metals. Nondestructive tests. Analysis and presentation of data. Principles of inspection. Part 2. Instructions for laboratory work. Problems. Appendices. Index.

Note: An engineering college textbook containing descriptive accounts of the principles, devices and techniques of engineering testing, together with a collection of problems to be solved in college laboratories. In this edition, the first part, containing the background material, accounts for about three-fourths of the total pages, and the problems occupy less than 50 pages. The book can be studied without access to a laboratory and is useful to engineering graduates and technicians in need of descriptions of specific test methods. The bibliography runs to 1,271 references and is a useful guide to the modern literature of the field. The book appeared in 1941 in a preliminary edition, and was reproduced from typewriter script. The second edition has been printed from type and given a more attractive format. Both text and bibliography have been thoroughly revised.

DIETZ, ALBERT GEORGE HENRY editor

Engineering laminates. New York John Wiley & Sons, Inc. 1949 797 p. illus. 24 cm. $15.00. 5354

Contents: Introduction. The strength of laminated and sandwich structural elements, by N. J. Hoff. Adhesives, by R. K. Pfleumer. Glued-laminated wood, by V. Ketchum. Plywood, by M. S. Parkes and D. Countryman. Composite laminated-wood-concrete construction, by W. D. Kenney. Plastics-bonded laminates, by R. K. Witt. Thermostat metals, by U. U. Savolainen. Aluminum-clad products, by E. H. Dix, Jr. Hot-dipped aluminum-coated steel, by R. P. Flickinson. Copper and copper-alloy clads, by W. L. Keene. Nickel-clad, monel-clad, and inconel-clad steel, by W. G. Theisinger. Stainless clad steel, by C. A. Schroeder. Cast laminated metallic materials, by J. S. Vanick. Hardness and wear resistance—hard surfacing by fusion welding, by R. S. Avery. Sprayed metal, by H. S. Ingham. Glass-lined steel equipment, by O. L. Chaseman. Composite-glass structures, by G. R. Watkins. Sandwich-type building boards having honeycomb-based cores, by A. Elmendorf and M. Laidl. Plastic-surfaced plywoods and their properties, by M. G. Bell. Structural-sandwich construction, by R. T. Schwartz. Rubber laminates, by W. E. Burton. Molding laminates and sandwich materials, by C. B. Hemming. Index.

Note. The term laminates, as used in this volume, includes all composites which are of value from an engineering point of view and whose properties differ significantly from the properties of the constituent materials. Emphasis is placed on the physical properties and engineering uses of the various types of laminates, but information regarding methods of manufacture and fabrication is also included. The volume is designed for the use of engineers and architects, and is particularly valuable for its extensive tabulations of data regarding the physical and mechanical properties of the wide variety of laminated products. Bibliographies accompany most of the chapters.

DIETZ ALBERT GEORGE HENRY

Materials of construction—wood plastics, fabrics. New York D Van Nostrand Company Inc., 1949 347 p. illus. 24 cm. (A technical series on building construction Walter C. Voss editor) $6.00 5355

Contents. Sources of timber supply. Growth and structure. Physical properties. Hygroscopic properties, shrinkage and swelling. Mechanical properties. Identification. Lumber grades and sizes. Destructive agencies. Preservative treatment. Veneers, adhesives, plywood, laminated wood. Textile materials. Chemistry of plastics and resins. Plasticizers, fillers, colors, film and sheet, coatings. Molds and molding methods. Plastics-based laminates, vulcanized fiber, resin-wood combinations. Properties of plastics. Building boards, structural sandwiches, timber-concrete. Index.

Note: A concise, almost encyclopedic, presentation of information on materials used in modern building. The various materials are discussed from the standpoint of their use in building, but much information is also included on the processes by which the synthetic materials are manufactured. Numerous tables of engineering data are included, and each chapter is supplemented by a useful bibliography.

DUMOND T C editor

Engineering materials manual New York Reinhold Publishing Corporation 1951 386 p illus. 30 cm. $7.50. 5356

Contents: Standard engineering steels. Stainless steels—their selection and application. High-strength low-alloy steels. Clad steels. Tool steels. Free cutting steels. Gray iron castings. Wrought aluminum alloys. Aluminum alloy castings. Magnesium alloys. Nickel and high-nickel alloys. Engineering bronzes. Beryllium copper. Bearing metals. Cemented carbides. Ceramics for engineering applications. Rubber as an engineering material. A plastics primer for engineers. Selection and application of plastics. Thermosetting plastics. Thermoplastics. Plastic laminates. Hard-facing materials. Organic finishes for metals. Electroplated coatings. Coloring of metals. Porcelain enamels. Industrial adhesives.

Note: A broad though unintegrated view of engineering materials is presented in this volume. The volume editor and the editors of many of the chapters are members of the editorial staff of the journal *Materials and methods*, and the book is made up largely if not altogether of material published in that journal. As would be expected in view of the source, there is much emphasis on materials developed since World War II and new applications of older materials. A number of the sections are brief, that on electroplated coatings—to cite an example—being only 11 pages long. The volume contains a number of useful tables, for example, 12 pages of tabulated information on typical methods of coloring various metals and alloys. There is no index.

GILKEY HERBERT JAMES AND OTHERS

Materials testing theory practice and significance of physical tests on engineering materials, by Herbert J Gilkey Glenn Murphy and Elmer O Bergman. New York McGraw Hill Book Company Inc., 1941 185 p. illus. 28 cm. $5 75 5357

Contents. Testing, testing equipment, and testing observations. Properties of materials. Evaluation of properties from load-displacement data. Tensile tests. Compressive tests. Shearing and torsional tests. Flexural tests. Column tests. Hardness tests. Fatigue and impact tests. Design, control, and curing of concrete mixtures. Experimental aids in stress analysis. Appendices. Subject, author and general source indexes.

bars. Cement, concrete and concrete aggregates. Building brick. Wood. Plastics. List of standards by methods of test. Static tension and compression tests. Hardness tests. Specific gravity and unit eight tests. Consistency and slump tests. Sampling and inspection.

Note Designed for the use of engineering college students as indicated in the title, this book contains the full text of nearly 50 ASTM standards, and also short informative articles on the purpose and ork of the American Society for Testing Materials, the riting of technical papers, the legal aspects of standardization, etc.

BATEMAN, JOHN HENRY

Materials of construction, a textbook for students of engineering New York Pitman Publishing Corporation, 1950 568 p. illus. 23 cm. $7 50 5347

Contents Introduction. Mineral aggregates. Cementing materials. Concrete—materials, essential properties, proportions—manufacture, placing, properties—mortar gypsum, and lime products. Structural clay products. Building stone. Lumber and timber. The manufacture of pig iron and steel. The crystal structure and constitution of metals and alloys. Alloy steels. The shaping of steel—the structural steels. Wrought iron, cast iron, malleable cast iron. Structural aluminum and structural magnesium. The preservation of the ferrous metals. Index.

Note A text and reference book in which the manufacture, properties, dimensions, etc., of building materials are described. A good deal of supplementary information is included. For example, the chapter on the manufacturing and placing of concrete provides reliable and fairly inclusive survey of current practices in the field including the placing of concrete in large structures such as dams, and also including special methods of placing such as "prepakt" concrete. The chapters are supplemented by good bibliographies.

BRADY, GEORGE S

Materials handbook, an encyclopedia for purchasing agents, engineers, executives, and foremen Eighth edition. New York Mc Graw Hill Book Company, Inc., 1956 1 022 p 24 cm $12 50 5348

Note A long-established cyclopedic reference book of technical and trade information on materials of commercial importance including such common ones as brick and uncommon ones such as walrus hide. Although the information given about the individual terms varies considerably generally speaking each product is the subject of a descriptive essay ranging in length from few sentences to several pages and containing information on such points as origin, physical properties and uses. Trade names and manufacturers' names are often mentioned. The preceding edition was published in 1951 In this eighth edition, the book is about 100 pages longer Descriptions of numerous recently developed products, and a selection of new trade names has been added.

BROWN, HARRY PHILIPS, AND OTHERS

Textbook of wood technology By H P Brown, A J Panshin, and C C Forsaith Formerly published under the title Commercial timbers of the United States New York McGraw Hill Book Company Inc 1949–52 2 v 23 cm (The American forestry series Walter Mulford, consulting editor) Vol. I $8 50 vol. II $11 00 5349

Contents. Volume I, Structure, identification defects, and uses of the commercial woods of the United States The plant origin of wood. The tree. The gross features of wood of value in identification. The woody plant cell The cambia of trees. The minute structure of coniferous woods. The minute structure of porous woods. Variable quality of wood within tree-species. Figure in wood. Defects in wood. Natural durability f wood. Glossary Index Volume II, The physical mechanical, and chemical properties f the commercial woods of the U ited States Part I, The physical properties of wood. Density and specific gravity Wood in relation to moisture. Wood in relation to heat. Wood in relation to sound, light, and electricity The bending and finishing of wood Part II The mechanical properties of wood Mechanics of short wooden columns. The mechanics of wooden beams. The mechanics of wooden beams—stresses in simple wooden beams subjected to transverse loading. The mechanics of wooden beams—divers analyses th respect to wooden beams and members. Stresses in wooden columns up to the proportional limit. Stresses in wooden beams and columns beyond the proportional limit. Standard testing procedure for determining the mechanical properties of ood. Working stresses for wood. Variation in the strength properties of wood. Strength properties of laminated wooden beams and columns. Strength properties and fire resistance of wood-steel construction. Strength properties of plywood. Holding power of timber fasteners. Holding power of timber fasteners—modern timber connectors. Stresses in framed structures. Part III, The chemical properties of wood. The chemical components of wood. Effect of chemical treatments on wood. Thermal reactions of wood and its decomposition by biological agents. Index.

Note. In this revision of an earlier work, it has been the authors' purpose "to bring together all available worthwhile information on the commercial timbers of the United States. The work is used as a text by college students of forestry and as a reference tool by engineers, architects, and others requiring knowledge of the structure and characteristics of wood. Volume I retains the general arrangement and scope of the previous work, but the former sections on durability and defects of wood have been enlarged to form five new chapters. Volume II is entirely new and has been added to achieve the above-stated comprehensiveness.

BURTON, WALTER E , editor

Engineering with rubber New York Mc Graw Hill Book Company, Inc., 1949 486 p. illus 23 cm $8 00 5350

Contents Types of rubber. Properties of rubber Rubber adhesives. Latex products. V-belts and sheaves. Flat rubber belting—transmission—conveyor—elevator Extruded rubber. Rubber mountings. Hard rubber Rubber hose. Rubber in hydraulic equipment. Lathe-cut rubber Rubber linings. Molded rubber Packing and sheet rubber. Rubber printing materials. Rubber-covered rolls. Sponge rubber. Rubber thread and tape. Miscellaneous rubber products. Vinyl chloride polymers. Case histories. Index.

Note. The chief purpose of this volume is to suggest to design engineers when and how rubber may be utilized to good advantage in machinery and manufactured products. In addition to serving as practical guide to the properties, uses, and engineering possibilities of natural and synthetic rubbers, it describes the methods of manufacture and operating characteristics for a ariety of products made from rubber and rubber compounds. Particularly useful are the tabulations of technical data regarding the dimensions, engineering properties, and structural details of these products.

COOLEY, PAUL A , AND ANN E RAPUZZI, compilers

National directory of commodity specifications, classified and alphabetical lists and brief descriptions of specifications of national recognition Third edition Prepared by Paul A Cooley and Ann E Rapuzzi under the direction of A. S McAllister Chief of the Division of Codes and Specifications Washington D C Government Printing Office 1945 1,311 p 27 cm (United States National Bureau of Standards. Miscellaneous publication M178 superseding Miscellaneous publication M130) o p 5351

Contents Introduction. Classified list of specifications. Animals and animal products (except wool and hair) Vegetable food products and beverages. Vegetable products, except food, fibers, and wood. Textiles. Wood and paper Nonmetallic minerals. Ores, metals, and manufactures (except machinery vehicles, and electrical supplies) Machinery and vehicles. Chemicals and allied products. Commodities not elsewhere classified. Directions for obtaining copies of specifications. Names and addresses of standardizing agencies. Index and alphabetical list of commodities.

Note This extensive publication of hich former editions appeared in 1925 and 1932 is classified list of printed specifications for the manufacture of every significant manufactured product, with brief description of the contents of the specifications. Included are the standards and specifications of various trade associations, technical societies, and national industrial organizations of all kinds, as well as the purchase specifications of arious branches of the Federal Government. The index, a closely printed section of 117 pages,

tion. Rubber and aviation, by J. J. Allen and others. Specification and inspection of rubber products, by W. J. McCortney and W. J. Kuppus. Rubber products for new or special purposes, by E. F. Riesing and J. E. Glock. Molecular structure and mechanical properties of polymers. Name index. Subject index.

Note: Written by experts, this book is a comprehensive source of information on the properties of rubber already developed, and on the specification of rubber for particular uses. It is addressed to graduate students and structural designers and to others in need of technical engineering information on rubber. The chapters on rubber in various fields of application are in the nature of general surveys in which typical uses are described without any attempt to describe all possible examples. To cite an example, only one short paragraph is devoted to air springs for automobiles, although the indications are that such springs will soon constitute a major use of rubber. The chapters on specification, inspection, and the development of rubber products for new uses are by comparison more complete treatments. Literature references are included in all of the chapters, and there are adequate indexes.

MARIN, JOSEPH

Engineering materials their mechanical properties and applications. New York Prentice-Hall, Inc., 1952 491 p. illus. 23 cm. (Prentice-Hall engineering design series John A. Hrones editor) $7.00. 5363

Contents (abridged) Part one, Mechanical properties—general. Static properties in tension and compression. Static properties in shear and bending. Static properties under combined stresses. Fatigue properties. Impact properties. Creep and temperature properties. Part two, Specific materials: Structure of materials and control of their properties. Ferrous metals and alloys. Non-ferrous metals and alloys. Non-metallic materials. Part three, Materials testing machines and strain gages. Name index. Subject index.

Note: Although this college textbook is designed to be used in introductory courses it contains an analytical treatment that carries the reader farther into many topics than is common in introductory books. Methods of testing materials and the interpretation and application of results are emphasized. Comparatively full discussions of such topics as creep and temperature properties are included. Related literature is listed in footnotes or chapter bibliographies. The author is Professor of Engineering Mechanics and Research Professor of Engineering Materials at Pennsylvania State College.

MILLS, ADELBERT P

Materials of construction their manufacture and properties. By the late Adelbert P Mills. Second, third, and fourth editions, edited by Harrison W Hayward. Fifth and sixth editions, rewritten and edited by Lloyd F Rader Sixth edition. New York John Wiley & Sons, Inc., 1955 650 p. illus. 24 cm. $7.50. 5364

Contents (abridged) Section I, Definitions of terms. Section II, Metals. Structure and constitution of metals. Tests of metals. Service requirements of metals. Sources and production of metals. Iron ore and pig iron. Steel. Wrought iron. Cast iron. Malleable cast iron. Alloy steels. Non-ferrous metals and alloys. Section III, Building stones and mineral aggregates. Section IV Cementing materials. Gypsum plaster. Lime. Cements. Section V Concrete. Section VI, Brick and clay products—refractory heat-insulating, and acoustical materials. Section VII, Timber. Section VIII, Organic plastics. Section IX, Laminates and adhesives. Section X, Organic protective coatings. Index.

Note. A book which has been widely used as a college textbook in its various editions since 1915. It describes sources, methods of manufacture, properties and uses of the important materials of construction. Special aspects such as methods of inspection and testing are included in the chapters on some materials. There are many tabular and graphical presentations of data. Literature references are supplied. The fifth edition was published in 1939 and it represented a very extensive revision of the preceding edition. The sixth edition contains a new chapter on mineral aggregates, and several of the chapters carried over have been revised so as to cover new developments in adhesives, coatings, non-destructive testing, etc.

MINER, DOUGLAS F, AND JOHN B SEASTONE editors

Handbook of engineering materials. Prepared by a staff of specialists. New York John Wiley & Sons Inc. 1955 1,380 p. illus. 22 cm. $17.50 5365

Contents. Section 1 General information on materials: Materials specifications and standards. Statistics in the application of materials. Mathematical and physical tables. Section 2, Metals: Ferrous metals. Aluminum. Magnesium. Copper and its alloys. Zinc. Nickel and its alloys. Other pure metals. Special purpose metals and alloys. Section 3 Non-metals. Wood and wood-base materials. Paper. Fibers. Plastics and rubbers. Organic finishing materials. Fuels. Carbon products. Ceramic materials. Industrial chemicals. Lubricants. Section 4 Construction materials. Cementing materials and concrete. Roofing materials. Timber. Rope. Foundations. Weather and moisture protection. Glass products. Index.

Note: A reference handbook which provides in a single volume a very wide range of information on materials of engineering interest. The main emphasis is appropriately on physical properties, but other information useful in the selection of materials is included also, such as characteristics which affect fabricating, commercial availability and special pointers on conditions affecting service. Many data are presented in tables and graphs. Much information is also conveyed in concisely written narrative descriptions and discussions. Literature references are contained in most of the subsections. The book was written by a group of experts, most of whom are employed in industry.

MOORE, HERBERT F AND MARK B MOORE

Textbook of the materials of engineering. Eighth edition. New York McGraw Hill Book Company Inc., 1953 372 p. illus. 24 cm. $6.75 5366

Contents. Introductory. Columns, stress, and strain, by J. O. Draffin. The elastic strength of materials. The failure of materials by flow or creep. The failure of materials by fracture. Tables of physical properties of typical structural metals. Structural damage, working stress, factor of safety. The failure of metallic materials by corrosion and by wear. The production of the common structural metals—cast metals. Crystalline structure and heat treatment of metals—alloying. Strengthening metal parts by surface treatment, welding, powdered metals. Wood. Building stone and ceramic materials. Cementing materials—gypsum, lime, portland cement, and other hydraulic cements. Concrete, by H. F Gonnerman. Plastics, by W. K. Findley. Rubber, leather, rope. Testing and inspection—experimental stress analysis. Specifications for materials. Stress, strain, elastic and crystalline distortion, and structural damage to machine parts and structural members. Name index. Subject index.

Note. The first edition of this standard text for engineering students was published in 1917. Now as then, the treatment is elementary and designed to provide the beginning student with a knowledge of the physical properties, methods of manufacture and fabrication of the more common building materials. Only stress-carrying materials are included, and the tabulation of properties is limited to those of typical building materials. Comparing this edition to the seventh, published in 1947, there have been some rearrangement and combining of various topics, but the chief revision has been in the discussion of materials which have assumed importance since 1947. A chapter has also been added dealing with the relationship between metal strength and their atomic and crystalline structure. The chapter bibliographies have been brought up to date.

MURPHY GLENN

Properties of engineering materials. Second edition. Scranton International Textbook Company 1947 459 p. illus. 23 cm. (International texts in civil engineering Benjamin A. Whistler consulting editor) $7.25 5367

Contents: Materials and the engineer. Behavior of materials under load. Failure of materials. Use of properties in design. Qualities other than strength. Control of the properties of materials. The iron-carbon system. Manufacture and properties of the ferrous metals. Nonferrous metals. Timber. Stone. Clay products. Cementing materials. Concrete. Miscellaneous materials. Review questions. Answers to problems. Index to properties. General index.

Note. A laboratory manual for the engineering student covering the operation of testing equipment, the taking of data, the preparation of reports, and the interpretation of the data secured. The student is given an insight into the function and background of purchase specifications and into the need for and methods of inspection and acceptance tests. A chapter is devoted to experimental aids in stress analysis, including the use of models for the prediction of structural behavior Typical problems are illustrated and numerous bibliographic notes are given in the text.

GREATHOUSE, GLENN A., AND CARL J WESSEL, editors

Deterioration of materials, causes and preventive techniques. A collaboration under the joint auspices of the Services Technical Committee of the Department of Defense and the Prevention of Deterioration Center, Division of Chemistry and Chemical Technology, National Academy of Sciences—National Research Council. New York Reinhold Publishing Corporation, 1954 835 p illus 24 cm. $14 00 5358

Contents. Part I, Some important factors in deterioration Climate and deterioration, by C. J Wessel and H. C. S. Thom. Chemical and physical agents of deterioration, by G. A. Greathouse and others. *Biological agents of deterioration, by R. A. St. George and* others. Part II, Materials and their preservation Metals, by N E. Promisel and G. S. Mustin. Wood and wood products, by G. M Hunt. Paper by C. J Wessel. Textiles and cordage, by C. J Wessel. Leather by R. M. Lollar Plastics and rubber by A. Lightbody and others. Paints, varnishes, enamels, and lacquers, by J E. Cowling and M. E. Roberts. Part III, Some assembled units and their preservation Electrical and electronic equipment, by H. C. Gilbertson. Optical instruments and photographic equipment, by H. St. Shirk. Part IV Some special aspects of preservation Dehumidification, by A. S. Gates, Jr and others. Packaging, by T A. Carlson. Toxicological evaluation of preservatives, by W C. Cox. Appendix Government specification numbers, by S. F Booth. Index.

Note. A reference book of basic and practical information. The scope is indeed broad for instance, the chapter on deterioration by chemical and physical agents includes discussions of damage by wind, ice and lightning! The chapters on preventive techniques include mentions of all useful techniques and give specific details on most of them. However the presentation is necessarily compact, and the reader is expected to turn to the literature cited in the bibliographies for fuller discussions and additional details. The book has developed from research originally undertaken during World War II and continued since under military auspices hence, there is decided military flavor Nevertheless much of the information presented is applicable also to civilian problems.

HUNT, GEORGE M , AND GEORGE A GARRATT

Wood preservation Second edition New York McGraw Hill Book Company 1953 417 p illus 24 cm. $7.50 5359

Content The field of wood preservation. Agencies of wood deterioration. Wood preservatives. Preparation of material for treatment. Wood-preserving processes. Factors affecting penetration and absorption Economic aspects of preservative treatment. Properties of treated wood. Treating plants and equipment. Methods of protecting wood other than by standard preservative treatment. Fire-retarding treatments. Appendix. Index.

Note This book is useful both as college text and as reference book. It provides an inclusive introduction to the field together with references to the more useful and authoritative literature. There is some emphasis on large-scale preservation problems, such as are presented by marine piles, railroad ties and telephone poles, but there is also adequate attention to such aspects as the protection of houses against decay and termites and to the repair of termite damage when it has occurred. The first edition was published in 1938. In preparing this edition, descriptions of number of methods of treatment were revised in accordance with recent developments, material was added on new preservatives and treatments, literature references and tables were brought up to date. *However most of the content is identical with that of the first* edition.

KEYSER, CARL A

Materials of engineering, properties, fabrication, uses, and testing Englewood Cliffs, N J Prentice Hall, Inc., 1956 502 p. illus. 22 cm. $8 00 5360

Contents. Part I, Metallic materials. Fundamentals of metal structure. General comments on testing and failure of metals. Testing and failure of metals under static loads at atmospheric temperatures. Testing and failure under dynamic loads. Testing and failure at high temperatures. Corrosion and corrosion testing. Extraction of metals from their ores. Effects of alloying on slowly cooled metals. Hardening by combined effects of alloying and heat treatment. Ferrous alloys. Nonferrous metals and alloys. Methods of metal fabrication and their effect on properties. Part II, Inorganic nonmetallic materials. Minerals, rocks, clay and related materials. Inorganic cementing materials. Concrete. Part III, Organic materials. Plastics. Rubber. Organic coatings. Wood. Index.

Note. A wide range of basic information on the major engineering materials is presented in this book. Appropriately about three-fourths of the space is devoted to metals, and these are covered from their submicroscopic structure to techniques of fabrication. Most topics are covered concisely and selected literature references are given for readers who seek more information. The book is organized so that it may be used in undergraduate courses offered to engineering students. It is suitable also for self-instruction and reference use by such readers as machine tool operators who feel need for basic technical information on engineering materials.

LEIGHOU, ROBERT BENJAMIN

Chemistry of engineering materials. Rewritten by the following members of the chemistry faculty of the Carnegie Institute of Technology J C Warner (editor) Thomas R. Alexander, Paul Fugassi, D S McKinney, and others. Fourth edition New York McGraw Hill Book Company Inc., 1942 645 p. illus 23 cm. (International chemical series L P Hammett, consulting editor) $8.50. 5361

Contents Water for steam generation. Fuels, combustion, and lubricants. Refractories. The nonferrous metals. Nonferrous alloys. Production of iron and steel. Alloys of iron constitution, treatment, and uses. Technology of shaping metals and alloys. Corrosion of metals and alloys. Protective metallic and inorganic coatings. Building stones. Lime and gypsum products. Portland cement and concrete. Clay and clay products. Abrasives. Glass. Organic plastics. Rubber natural and synthetic. Organic protective coatings: paints, varnishes, enamels, lacquers. Glues and adhesives. Insulating materials.

Note. A textbook for sophomore and junior engineering students and reference book for practicing engineers who have not had advanced courses in chemistry and metallurgy The book is designed to provide information on the chemical properties of engineering materials so that they may be more intelligently selected and used. This fourth edition represents revision of much of the text, especially in the sections dealing with water for steam generation, fuels, abrasives, glass, organic plastics, and rubber

MCPHERSON, A. T , AND ALEXANDER KLEMIN, editors

Engineering uses of rubber New York Reinhold Publishing Corporation 1956 490 p illus. 24 cm. $12 50 5362

Contents: Introduction, by E. A. Hauser Making rubber products for engineering uses, by E. G. Kimmich. Compounding—the art of tailoring the properties of rubber to the use by G. E. Manson. The General engineering properties of rubber by E. G. Kimmich. The design of rubber mountings, by J F Downie Smith Deterioration of rubber from use and with age by J Crabtree and F S. Malm. Rubber in civil engineering, by W E Scoville, Jr Rubber in electrical Rubber in chemical engineering, by R. S. Garvey Jr Rubber in electrical engineering, by G. J Crowdes. Tires, by R. H. Spohman. Belt conveyors, by F D. Saloff. Rubber in automobiles, by J. W Mar-

Contents: Structure of wood. Characteristics of some important commercial woods grown in the United States. Physical properties of wood. Strength values of clear wood and related factors. Grades and uses of lumber. Stress grades and working stresses. Timber fastenings. Solid and built-up structural members. Gluing of wood. Glued structural members. Plywood and other combinations products. Structural sandwich construction. Bent wood members. Control of moisture content and shrinkage of wood. Fire resistance of wood construction. Painting and finishing wood. Protection from wood-destroying organisms. Wood preservation. Poles, piling, and ties. Thermal insulation. Building fiberboards. Modified woods and paper-base laminates. Glossary. Index.

Note: The handbook was prepared and is published as an aid to better and more efficient use of wood as a material of construction. It contains various data for its use in design and specification. The chief basis for the handbook is the accumulation of information at the Forest Products Laboratory which has resulted from the engineering and allied investigations of wood and wood products during the more than 40 years of its maintenance researches on wood. Each chapter is filled with technical information on various phases of wood usage and is concluded with a brief bibliography of sources cited. The publication is of value to carpenters, cabinet makers, contractors, engineers, architects, lumber dealers, and others concerned with wood as a structural material.

UNITED STATES. NATIONAL BUREAU OF STANDARDS

Characteristics and applications of resistance strain gages. Proceedings of the NBS Semicentennial Symposium on Resistance Strain Gages held at the NBS on November 8 and 9 1951 Washington, D C Government Printing Office, 1954 140 p. illus. 24 cm. (United States. National Bureau of Standards. Circular 528) $1.50. 5374

Contents: Postmortem determinations for elastic and plastic strains of tensile specimens, by L. Vigness and T. K. Perdue. Cementing and waterproofing of resistance strain gages, by R. O. Boone. Unbonded resistance-wire strain gage, by L. Statham. An unbonded bonded-wire resistance strain gage for measuring internal strain in concrete, by R. C. Yalom, jr. Properties of concrete under impact as measured with bonded-wire strain gages, by D. Watstein. A new strain gage without transverse sensitivity, by A. U. Huggenberger (abstract). How to use C-H gages, by G. Y. A. Gustafsson. Bonded-wire strain gage in the field of instrumentation, by A. C. Ruge. Commercial weighing with resistance strain gages, by A. L. Thurston. Applications of resistance-wire strain gages to high-capacity load-(?)weighing devices, by D. R. Tate. Preliminary investigation of the strain sensitivity of conducting films, by W. R. Campbell.

Note: Activity of the National Bureau of Standards on resistance strain gages began with the McCollum-Peters carbon-pile telemeter. This was followed by a study of carbon-strip gages in 1934. A few years later the introduction of strain sensitive fine wire led to greatly accelerated work in this field. Extensive performance tests were made on wire strain gages of different manufacture. Continued tests and studies were made at the National Bureau of Standards and at other laboratories. Such studies were devoted to the application of strain gages to the measurement of mechanical quantities, such as acceleration, impact force, and dynamic pressure. Calibrations were carried out on many instruments employing wire strain gages as the sensing element. At the 1951 symposium, held by the Bureau in conjunction with the Office of Naval Research, 11 papers on both experimental and theoretical aspects of the subjects were presented. Ten of the papers are published in this volume, together with the discussion which took place at the meeting.

WANGAARD FREDERICK FIELD

The mechanical properties of wood. New York John Wiley & Sons Inc., 1950 377 p. illus. 22 cm. $7.50. 5375

Contents (abridged): Part I, Basic mechanical properties of clear wood. Structural uses of wood. Tensile strength. Compression or crushing strength. Bending. Toughness. Hardness. Cleavage resistance. Elastic properties. Part II, Factors affecting the mechanical properties of wood. Defects—Knots—Checks and shakes—Cross grain—Wood-inhabiting fungi—Compression failures and cross breaks—Bird pecks—Mineral streaks—Lightning rings. Factors other than defects—Density—Position in tree—Moisture content—Preservative treatment—Heartwood and sapwood—Season of cutting—Duration of stress—Fatigue. Part III, Working stresses for structural lumber. Factors concerned in the derivation of basic stresses. Basic-stress values for clear wood. The basis for structural lumber grades. Application of working stresses in design. Part IV Timber testing. Working plan. Moisture determination. Machines for static tests. Description of tests. References. Appendix. Index.

Note: In this useful book information is presented on the various factors which affect the strength and other mechanical properties of wood and the methods of testing wood. All of the topics mentioned in the above table of contents and about as many more are covered compactly but in sufficient detail for average use. The text is liberally supplemented with literature references and tabulated data. The book is of interest to builders, structural engineers, and others who are required to specify or test wood for manufacturing or structural purposes. It supersedes G. A. Garratt's book of the same title.

WHITE ALFRED HOLMES

Engineering materials. Second edition. New York McGraw Hill Book Company Inc. 1948 686 p. illus. 24 cm. $5.50 5376

Contents (abridged): Fundamental properties of solids. Iron and its alloys with carbon. Manufacture of iron and low-carbon alloys from the ore. Early methods of producing wrought iron and steel from pig iron. Manufacture of steel by the Bessemer, open-hearth, and electric-furnace processes. Properties of plain carbon steel as influenced by fabricating operations. Alloy steels with low-alloy content. Properties of high-alloy steels including tool steels, stainless steels, and alloys for high-temperature service. Castings of steel, malleable iron, and gray iron. Copper, nickel, zinc, and their alloys. The light metals—aluminum, magnesium, beryllium, and their alloys. The soft metals—lead, tin, and their alloys. Bearing metals. Rocks and their decomposition products. Clay products. Lime, gypsum, and magnesium oxychloride products. The inorganic cements. Fuels and combustion. Water and its industrial utilization. Soap and other detergents. Wood and wood products. Organic protective coatings, old type. Synthetic materials for plastics, adhesives, and protective coatings. Plastics, laminates, and synthetic coatings. Index.

Note. Although this volume is intended primarily for use as a text in college engineering courses, the compilation of essential data regarding the manufacture, properties, and uses of engineering materials makes it of value also as a reference tool for the practicing engineer. This edition has been extensively revised to incorporate developments during World War II, particularly in light metals and plastic materials. New chapters have been added on wood and wood products and various synthetic materials, and the chapters on carbon steel, alloy steels, and light metals have been rewritten and enlarged. The brief chapter bibliographies have been brought up to date.

WITHEY M O AND G W WASHA

Materials of construction. New York John Wiley & Sons, Inc., 1954 870 p. illus. 24 cm. $9.00 5377

Contents: Synopsis of the principles of mechanics of materials. Machines and appliances for mechanical tests. Testing of structural materials. Characteristics, physical properties, and uses of wood. The deterioration and preservation of timber. The mechanical properties of timber. Building stone. Structural clay products. Portland cement. Natural and other hydraulic cements. Limes and plasters. Methods of testing hydraulic cements. Concrete aggregates. Making mortar and concrete. The physical properties of mortar and concrete. Portland cement products. Metals and their ores. Reduction of iron from its ores. Manufacture of wrought iron and steel. Manufacture of iron and steel shapes. Formation and structure of alloys. Constitution of iron and steel. Properties of wrought iron. Effect of composition on the properties of steel. Heat treatment of steel. Effect of mechanical work on the properties of steel. Alloy steels. Cast iron and malleable cast iron. Constitution of some of the more important non-ferrous alloys. Non-ferrous metals and alloys. The effect of temperature on the properties of metals. Fatigue of structural materials. Index.

Note. An engineering college textbook of sufficiently comprehensive scope to render it of interest to some graduate civil engineers. As the title indicates, its scope is primarily the materials used in construction of buildings. Each of the materials named in the chapter titles is discussed as to source, method of manufacture, mechanical and physical properties, commercial varieties and methods of testing. In the chapters on mortar and concrete, there is also considerable information on the handling of these materials in placing them in structures. There are scattered literature references and an exceptionally detailed index. The book supersedes J. B. Johnson's Materials of construction, revised by M. O. Withey and J. Aston, eighth edition, New York, 1939.

Note A study of the basic principles which are responsible for the physical and chemical behavior of engineering materials. The volume is intended as an undergraduate engineering school text rather than as a source book of data, and as such it includes problems to solve and references for collateral reading. In the second edition the plan remains the same, but revisions have been made to include a new chapter on control of the properties of materials, and recent developments in powder metallurgy laminated products, cold treatment of metals, high-temperature alloys, silicones, and synthetic rubber have been included.

NORD, MELVIN

Textbook of engineering materials New York John Wiley & Sons, Inc., 1952 518 p illus 24 cm. $6 50 5368

Contents (abridged) Part I, The raw materials of engineering: Sources of raw materials. Formation of mineral deposits. Recovery of mineral. Part II, Production of engineering materials: Mineral dressing. Unit chemical processes in the production of engineering materials. Principles and processes of extractive metallurgy Part III Properties of engineering materials States of matter Mechanical properties of engineering materials. Physical and chemical properties of engineering materials. Part IV Specific engineering materials. Section 1 Materials for the generation of energy—water—fuels—explosives. Section 2 Metals. Section 3 Natural and artificial stone. Section 4 Natural and synthetic organic materials of construction. Section 5 Protective materials. Index.

Note The first three parts of this work are devoted to an exposition of basic aspects of engineering materials. Part IV—which accounts for more than 300 of the 500-odd pages—is devoted to discussions and descriptions of specific materials. In this part each material considered is defined, and its origin, properties, manufacture, and uses are described. Finally there is a short list of literature references. Many of these descriptions contain enough material to make them useful for reference by readers who want background information rather than engineering data. However the book is intended for use in short courses in engineering colleges.

PERRY, THOMAS DOANE

Modern plywood Second edition New York Pitman Publishing Corporation, 1948 458 p illus 23 cm. (Pitman books on industrial materials and processes, Alexander Klemin, advisory editor) $7 00 5369

Contents Introduction, by Wilson Compton. Glossary of trade terms used in the plywood industry Brief history of plywood. Advantages of plywood. Adhesives for plywood. Characteristics of modern plywood. Veneer manufacturing. Plywood manufacturing. High-density plywood. Plywood in industry Engineering data on plywood. Grading rules. Testing adhesives. Index.

Note A comprehensive survey of the manufacture, properties, and uses of plywood. Approximately equal emphasis is placed upon the manufacture of plywood and the manufacture of articles from plywood. In this edition the detailed descriptions of manufacturing methods have been revised to cover recent developments. Thus the chapter on adhesives has been more than doubled in size to include new material on animal, vegetable and especially synthetic resin glues and the chapter on manufacturing methods contains new sections on progressive gluing, metal-to-wood gluing, and curing of resins by electrical high-frequency methods. The excellent bibliography of the 1942 edition has been brought up to date, but the references are now grouped at the end of each main section

PERRY THOMAS DOANE

Modern wood adhesives. New York Pitman Publishing Corporation 1944 208 p illus 23 cm. $4 50 5370

Contents Origin of glues and their uses. Animal glues. Vegetable glues. Casein glues. Soybean glues. Synthetic resin adhesives. Silicate of soda glues. Albumin glues. Prepared glues. Methods of comparing glues. Glue mixing and spreading equipment. Pressure in gluing. Adhesion secured by heat. Reducers for glue solvents. Impregnation. Glue testing. Index.

Note A discussion of the manufacturing processes, properties, and applications of the different types of glues used in the development of plywood and veneers. The glues are listed and described in separate chapters according to their origin. Following these accounts of special characteristics, are general chapters covering methods of comparing glues, equipment for preparing and applying them, the effect of pressure and heat in securing good glue joints, the problem of wood impregnation and the procedure in various methods of glue testing. There are brief chapter bibliographies and a glossary

SONNEBORN, RALPH H.

Fiberglas reinforced plastics Contributing authors Albert G H Dietz and Alton S. Heyser New York Reinhold Publishing Corporation, 1954 240 p illus 23 cm $4.50 5371

Contents Part I The nature and uses of fiberglas reinforced plastics. Materials for FRP Manufacturing processes for fiberglas reinforced plastics. Secondary operations. Inspection and testing. Properties of FRP Design methods based on experience. Applications of FRP Part II: Design theory of reinforced plastics. Structural design of FRP laminates. Appendixes: Glossary of terms as applied to FRP Selected bibliography Index.

Note. The combination of fine glass fibers (and fabrics made of such fibers) with thermosetting plastic resins has produced a new class of engineering materials with unique and useful properties. Applications already developed include a variety of products such as roofing panels, lampshades, household laundry tubs, safety helmets and sports car bodies. This is a book on these materials, written from the viewpoint of product designers and engineers. As the chapter titles indicate design is covered both from the standpoint of theory and practical experience. Molds and shaping processes are considered at some length. There are about 100 illustrations, many of which are reproductions of photographs of steps in manufacturing processes. The bibliography does not include patents.

TIEMANN, HARRY DONALD

Wood technology constitution properties and uses. Third edition. New York Pitman Publishing Corporation 1951 396 p. illus. 23 cm. (Pitman Books on industrial materials and processes, Alexander Klemin, advisory editor) $6 00 5372

Contents Introduction. What wood is. The life of a tree and its relation to the human race. The structure of wood. How to identify species of wood by visible structure. The structure of the cell wall. Chemistry of wood and cellulose. Modified cellulose—textile fibers and plastics. Paper and pulp from wood. Moisture relations of wood. The shrinkage and swelling. Collapse its cause and its significance. Dimensional stability Drying lumber procedure in kiln-drying operations. Physical properties of wood. Mechanical properties of wood. Effect of temperature and kiln-drying—temporary exposure—Yale tests. Effect of temperature at time of test. Plywood, glues, adhesives. Dielectric heating for gluing and drying. Biological destructive agencies and preservative measures. Permeability of wood. Distinguishing features of American woods. Appendixes. Index.

Note A clearly written, comprehensive survey of the mechanical properties of wood and of the technology of handling it as a structural material. It does not cover such matters as the design of timber structures rather it covers the varying strength of wood under varying conditions, adhesives for bonding wood, how wood is made into paper, etc. There are also excellent discussions of the various defects of wood. References are made to scores of research studies, which is not surprising in view of the fact that the author was once a member of the staff of the United States Forest Products Laboratory The second edition was published in 1944 Much important material was added in this third edition.

UNITED STATES FOREST PRODUCTS LABORATORY

Wood handbook. Basic information on wood as a material of construction, with data for its use in design and specification Prepared by The Forest Products Laboratory Forest Service, U S Department of Agriculture. Washington D C Government Printing Office 1955 528 p illus. 23 cm (United States. Department of Agriculture Agriculture handbook no 72) $2 00 5373

as an infinite plate. The influence of the material on stress distribution. Lateral extensometers and isopachic curves. The numerical solution of Laplace's equation. Conformal transformations, the use of polar and bipolar coordinates in isoparametrics. The stresses at joints in three dimensions. Three-dimensional technique. Applications of oblique incidence and of rotational effects. Circular sections in torsion and bending. Scattered and convergent light. Appendix: Fosterite—a new material for three-dimensional photoelasticity. Index of names. Subject index.

Note: Widely recognized as the standard treatise on its subject, the work is both an introduction to photoelastic methods of stress analysis and a monograph of theory and advanced techniques. The first volume covers the fundamental theory and the purely optical techniques. The second volume, in addition to further developments of the theory and methods covered in the first volume, introduces the theory of elasticity, describes methods for determining the sums of principal stresses at interior points and discusses the theory and techniques and applications of three-dimensional photoelasticity. Methods not requiring transparent models also are described in the second volume, but not in the first. Both volumes are illustrated with numerous strain diagrams and photographs of strain patterns.

FROCHT MAX MARK

Strength of materials a first course. New York. The Ronald Press Company 1951 439 p. illus. 24 cm. $6.00. 5385

Contents: Basic concepts. Statically determinate stresses in tension and bending. Statically determinate stresses due to internal pressure and torque. Basic concepts of strain and axial deformations. The state of stress and strain at a point. The significance of static stresses and stresses in design: photoelastic patterns. Shear and bending moments. Stresses in symmetrical beams. Failure under steady and alternating stresses. Torsion in circular shafts. Deflections of beams. Statically indeterminate beams. Columns and curved beams. Riveted joints and nonhomogeneous beams. Appendixes. Index.

Note: An engineering college textbook written by a well-known authority in photoelasticity and other methods of experimental stress analysis. The author has taken particular pains to emphasize the practical aspects of the subject and to describe contemporary methods. Among the numerous illustrations are a number of photographs of stress patterns obtained by photoelastic techniques. The book supersedes a text of the same title written by the author and M. C. Leps, published in 1934. Only one chapter has been carried over from that book without extensive revision.

LAURSON PHILIP GUSTAVE, AND WILLIAM JUNKIN COX

Mechanics of materials. Third edition. New York. John Wiley & Sons, Inc 1954 414 p. illus. 23 cm. $7.50. 5386

Contents: Stress and deformation. Mechanical properties of materials. Allowable stresses. Pressure containers. Riveted and welded joints. Stresses due to axial loads. Torsional stress, shafts, and helical springs. Beams—shear and bending moment. Stresses in beams. Design of beams. The deflection of statically determinate beams. Restrained beams. Direct stress combined with bending. Columns with axial loads. Columns with eccentric loads. Combined stresses. Elastic energy: stresses produced by moving bodies. Continuous beams. Beams of two materials. Beams (additional topics). Eccentrically loaded connections. Comprehensive problems. Appendixes. Centroids of areas. The moment of inertia of a plane area. Tables. Index.

Note: An engineering college textbook designed for use in introductory courses in the mechanics of materials (strength of materials). The first fourteen chapters are a well-integrated study of basic principles; the remaining chapters contain slightly more advanced, more specialized material. The discussions are relatively full, and many worked examples are included. The second edition was published in 1947. Some of the expository text was revised, and many new worked examples and problems for the student to solve were added in preparing this third edition.

MARIN JOSEPH AND JOHN A. SAUER

Strength of materials. Second edition. New York. The Macmillan Company 1954 518 p. illus. 24 cm. $6.75 5387

Contents: Part 1, Simple stresses: Members subjected to simple tension and compression. Members subjected to shear and torsion. Members subjected to bending—beams. Members subjected to axial and bending loads—short members. Members subjected to axial and bending loads—long members or columns. Part 2, Statically indeterminate stresses: Deformation methods of analysis. Energy methods of analysis. Part 3, Combined stresses. Determination of stresses. Theories of failure and design. Part 4, Special topics: Riveted and welded joints. Special problems on bending of beams. Members subjected to fatigue and impact loads. Temperature and creep properties of materials. Experimental stress analysis. Appendixes: Centroids and moments of inertia of plane areas. Tables of physical properties and design stresses for common engineering materials. Index.

Note: A well-organized introductory text which is designed to teach engineering college students the analysis of structural members under varying conditions of strain and stress. It describes the methods used to ascertain the stresses and to determine the dimensions of members required to meet specific loads. The theory of the subject is emphasized, but it is integrated with discussions of the mechanical properties of materials and the techniques of design. The drawings and diagrams and, in fact, the whole format of the book are exceptionally good. The first edition was published in 1948. This second edition, written with a co-author represents an extensive rewriting and augmentation. The chapters on temperature and creep properties and on experimental stress analysis are new and extensive revisions were made in the chapters carried over.

MILLER, F E AND H. A. DOERINGSFELD

Mechanics of materials. Scranton International Textbook Company 1955 514 p. illus. 23 cm. $7.50 5388

Contents: Stress and strain. Properties of engineering materials. Allowable stresses. Riveted and welded joints. Torsion. Shear and bending moment. Stresses in beams. Deflection of statically determinate beams. Restrained beams. Additional topics on beams. Bending or torsion stresses combined with direct stresses. Combined stresses for general types of loading. Column theory and design. Fatigue of metals. Energy of strain and impact. Stresses in thick-walled cylinders. Appendixes. Index.

Note: A relatively new introduction to mechanics of materials, written for undergraduate college students who are taking their first course in the subject and have completed courses in statics and integral calculus. It is well organized, adequately illustrated, and the publisher has given the volume a good format. The authors are members of the faculty of the University of Minnesota.

MURPHY GLENN

Advanced mechanics of materials. New York McGraw Hill Book Company Inc., 1946 307 p. illus. 24 cm. $7.00. 5389

Contents: Relationship of materials to design. Stresses and strains at a point. Stress-strain relationships. Theories of failure. Axial loading. Cylinders, spheres, and disks under radially symmetrical loads. Torsion. Flexure. Cross shear. Introduction to photoelastic analysis. Compressive loads and buckling. Answers to problems. Author index. Subject index.

Note: Primarily this book is a text in stress analysis for use in advanced engineering courses. The treatment is largely theoretical and requires a sound background of mathematics and a knowledge of the strength and properties of materials. Practical applications of the subject are illustrated by the numerous problems given at the end of each chapter. The book is also of some use to practicing structural draftsmen and engineers, for its treatment of numerous special design problems—for example, torsional stresses in thin-walled closed sections—which are accompanied in most cases by references to fuller treatments in other publications.

MURPHY GLENN

Mechanics of materials. Revised printing. New York The Ronald Press Company 1948. 310 p. illus. 23 cm. $5.00 5390

Contents: Stress, strain, and axial loading. Joints and connections for axially loaded members. Torsion. Stresses in flexural members. Deflection of flexural members. Statically indeterminate beams. Columns. Combined loadings. Dynamic and repeated loads. Appendixes: Properties of sections. Answers to problems. Index.

Note: A well-written introductory textbook. It is briefer than some of the available texts for introductory courses in mechanics of materials or strength of materials, but the fundamentals of the subject are well covered and there are 639 problems for students to solve. Answers to the problems are contained in the book.

WOLDMAN, NORMAN EMME

Materials engineering of metal products. New York Reinhold Publishing Corporation, 1949 583 p. illus 24 cm $12 50 5378

Contents (abridged) Section I, Materials for light weight construction. Aluminum alloys. Magnesium alloys. High strength-low alloy steels. Stainless steel. Section II, Materials for mechanical products Gear materials. Spring materials. Bearing materials. Section III, Materials for the electrical industries. Magnetic materials. Electrical contacts. Thermostat metals. Section IV Materials for special and severe service Corrosion and its prevention. High-temperature materials. Section V Testing Mechanical testing. Nondestructive testing and inspecting. Appendix. Properties of materials. Subject index.

Note Essentially a desk reference book for engineers concerned with design and specification. However it is more than a mere compilation of data. The expected tabulations of properties are present, but the greater part of the text consists of concise but helpful discussions of such matters as the behavior of specific materials under working conditions. For example, the chapter on electrical contacts includes a discussion several pages in length on contact operation and failures, in which the causes of contact failures are made clear Most of the matter relates to metals, but a few other materials, such as rawhide for gears, are considered.

YOUNG, JAMES F

Materials and processes. Second edition New York John Wiley & Sons, Inc., 1954 1,074 p illus 24 cm. $9 75 5379

Contents Part I, Materials The nature of pure metals. Alloys. Metallographic examination. Mechanical properties of metals. Corrosion and tarnishing properties of metals. Electrical and magnetic properties of metals. Iron and steel. Nonferrous metals and alloys. Nonmetallic materials. Electrical insulation. Plastics. Rubber Ceramics. Miscellaneous nonmetallic materials. Part II, Processes. Casting processes. Powder metallurgy Heat treating. Hot-working processes. Cold-working processes. Welding and allied processes. Machining. Cleaning, plating, and organic finishing of metals. Gaging, inspection, and nondestructive testing. Statistical methods useful in industrial quality control. Index.

Note. This book is a broad survey from the engineering standpoint of materials used in manufacturing and of the chief manufacturing processes. Addressed to engineers, its chief purpose is to provide foundation of basic information as background for practical engineering work in machine design, production control, etc. Even though the scope is broad, wide range of reference data and manufacturing "know how" is included. The first edition appeared in 1944 In the second edition the book is half again as long and contains much added information on developments of the last decade.

MECHANICS OF MATERIALS

CONWAY, HARRY D

Mechanics of materials. New York Prentice-Hall, Inc 1950 325 p illus 24 cm (Prentice-Hall engineering design series John Hrones editor) $5 50 5380

Contents. Elementary stress and strain. Compound stress and strain. Welded and riveted joints. Theory of torsion. Shearing and bending of beams. The stresses in beams. Deflection due to bending. Clamped and continuous beams. Miscellaneous beams. Columns. Failure under combined stresses. Thick cylindrical and spherical shells subjected to uniform pressure. Statical indeterminacy and Castigliano's theorem. Appendix Moments of inertia of areas. Index.

Note A standard, introductory textbook based on the author' years f teaching the subject in courses given in the College of Engineering of Cornell University Most of the chapters contain clear statement of assumptions on which the theory developed in the chapter is based. Many worked examples and also many problems for the student to solv ar included.

COX, GLEN NELSON AND OTHERS

Strength of materials. By Glen N Cox, Frank J Germano and John H. Bateman New York Pitman Publishing Corporation, 1951 408 p illus. 24 cm. $6 50 5381

Contents Stress and strain. Materials testing and properties of materials. Riveted and welded joints thin-walled cylinders and spheres. Torsion. Shearing force and bending moment in beams. Simple stresses in beams. Combined stresses. Special beams and beams of t materials. Deflection of statically determinate beams. Statically indeterminate beams. Columns. Fatigue of metals. Stresses caused by impact and energy loads. Curved beams. Appendices. Moment-distribution method for continuous beams. Tables. Index.

Note. A clear explicit style and conformity to recently published experimental results and to major United States of America building codes are features of this introductory textbook. Current building techniques, such as the making of elded joints by shielded arc, have been taken into account. The theory of columns is discussed in the light of Ryder's A rational explanation of column behavior, which appeared in 1948. Both the moment-distribution method and the theorem of three-moments for the solution of continuous beam problems are explained. A generous number of sol ed problems are included in the exposition.

DEN HARTOG, JACOB PIETER

Advanced strength of materials. New York McGraw Hill Book Company, Inc., 1952 379 p illus 24 cm. $8 50 5382

Contents Torsion. Rotating disks. Membrane stresses in shells. Bending of flat plates. Beams on elastic foundation. Two-dimensional theory of elasticity The energy method. Buckling. Miscellaneous topics. Problems. Answers to problems. Index.

Note. A textbook designed for engineering college students who have completed an introductory course in strength of materials. The author describes it as an intermediate book designed to bridge the gap between elementary texts and advanced treatises on elasticity It has been developed from material used in two courses offered to senior and graduate students at Massachusetts Institute of Technology

FREUDENTHAL, ALFRED M

The inelastic behavior of engineering materials and structures New York John Wiley & Sons, Inc. 1950 587 p illus 23 cm. $11 50 5383

Contents (abridged) Part A, The structural aspect of mechanical behavior The structure of matter Structural theories of deformation. Part B, Mechanics of inelastic deformation Mechanical variables. Linear behavior Plasticity Work hardening of polycrystalline metals. Creep and relaxation. Inelastic behavior under dynamic conditions. Fracture. Rheological behavior of suspensions and gels. Part C, Application of the mechanics of inelastic behavior: Plasticity Work hardening and creep. Author index. Subject index.

Note A contribution of considerable importance to the understanding of the behavior of engineering materials hen they are strained beyond the elastic limit. The subject has application to such techniques as the rolling of metals, the drawing of wires, the design of structural parts so as to avoid failure by fracture and creep. Basic physical principles interpreted in terms of the Bohr atom are emphasized, but there are frequent references to applications and testing methods. The book was developed from notes prepared for graduate course at the University of Illinois, and its audience is graduate engineering students and practicing engineers.

FROCHT, MAX MARK

Photoelasticity New York John Wiley & Sons Inc. 1941–48 2 v illus (part col d) 23 cm. Vol. I, $13 00 vol. II $14 50 5384

Contents Volume I Stresses and strains in two dimensions. Differential equations of equilibrium. Preliminary optics. Polarized light. Double refraction. Devices used for the polarization of light. Polariscopes. The stress-optic law and the stress pattern. Isoclinics and stress trajectories. Principal stresses across sections of symmetry by the slope equilibrium (rapid) method. Shear and normal stresses across straight lines (shear difference method) Principal stresses by graphical integration. Materials and models. Diphase molecular theory of plastics and its relation to the annealing of bakelite and to the frozen stress pattern. Technique of stress patterns. Features of equipment. Photography Name index. Subject index Volume II The compatibility equation and elementary stress functions in two dimensions. Radial stresses in the semi-infinite plate. Radial stresses in wedges and beams. The ircular disk Concentrated load

beam. Columns. Special topics. Appendixes. Moments of inertia. Tables. Index.

Note: A clearly written introduction designed for the instruction of students in engineering colleges. It is well organized from the standpoint of institutions of learning. There are over 1,200 problems for the student to solve. In addition to an adequate number of worked examples in the text.

SLOANE, ALVIN

Mechanics of materials. New York The Macmillan Company 1952 468 p illus. 24 cm. $6.50. 5397

Contents: Introduction to mechanics of materials. Bending. The beam theory. Corollary I—The longitudinal shear theory. Corollary II—The deflection theory. Violations of the limitations of the beam theory. Torsion. Column theory. Combined loading. Elastic strain energy. Mechanical properties of materials. Additional uses of Mohr's circle. Appendix. Tables. Index.

Note: A textbook for first courses in this subject in engineering colleges. It has a number of unusual features, such as the introduction of Mohr's circle in the first chapter and frequent use of this concept in later exposition. The author is Associate Professor of Mechanical Engineering in Massachusetts Institute of Technology.

TIMOSHENKO S AND GLEASON H. MAC CULLOUGH

Elements of strength of materials. Third edition. Princeton D Van Nostrand Company Inc., 1949 426 p. illus. 24 cm. $6.00 5398

Contents: Tension and compression. Shearing stress, riveted and welded joints, thin-walled cylinders. Combined stresses—analysis of plane stress. Shearing force and bending moment. Stresses in beams. Deflection of beams. Statically indeterminate problems in bending. Special topics concerning beams. Torsion—torsion combined with thrust or bending. Axial force accompanied by bending—theory of columns. Energy of strain. Elements of photo-elastic theory. Mechanical properties of materials. Appendices. Index of names mentioned. Index of subjects.

Note: A shorter, more elementary version of the similar author *Strength of materials*, described below. It is not simply another version of Part of that work but contains a selection of material from both volumes. It presents a broad, elementary view of the field but includes many solved problems as part of the expository text. Problems to be solved by the student are included also. It has a number of special features, including the use of Mohr's circle for solving problems in combined stress, rational treatment of the column problem, and a discussion of photo-elasticity. The second edition was published in 1940. A number of important changes were made in preparing this third edition, including revisions and organizations in the text and in the problems.

TIMOSHENKO S

Strength of materials. Third edition. Princeton. D Van Nostrand Company Inc., 1955–56. 2 v illus. 23 cm. Part I $6.50 part II, $7.50. 5399

Contents: Part I, Elementary theory and problems: Tension and compression within the elastic limit. Analysis of stress and strain. Bending moment and shearing force. Stresses in laterally loaded symmetrical beams. Deflection of laterally loaded symmetrical beams. Statically indeterminate problems in bending. Symmetrical beams of variable cross section—beams of two materials. Bending of beams in a plane which is not a plane of symmetry. Combined bending and axial load—theory of columns. Torsion and combined bending and torsion. Strain energy and impact. Curved bars. Appendix. Author index. Subject index. Part II, Advanced theory and problems: Beams on elastic foundations. Beams with combined axial and lateral loads. Special problems in the bending of beams. Thin plates and shells. Buckling of bars, plates and shells. Deformations symmetrical about an axis. Torsion. Stress concentration. Deformations beyond the elastic limit. Mechanical properties of materials. Author index. Subject index.

Note: An authoritative work used both as a textbook in comprehensive courses in engineering colleges and as a reference book. As shown above, it is divided into two distinct parts which are published as separate volumes. The first part is used as a text in introductory elementary courses, while the second part contains the advanced methods and rigorous analyses used in professional engineering. The material in Volume I is a suitable preparation for the study of the material in the second volume. However the volumes may be and are used independently. The first edition of Volume I was published in 1930, and the second edition in 1940. In the case of the second volume, the date of the first edition was 1930, and the date of the second edition 1941. In comparison to the second edition, important revisions were made in both volumes. Also, there was some reorganization of the material. This included, among other changes, the transfer of the material on curved bars from the second volume of the work to the first.

INSTRUMENTATION AND CONTROL

AHRENDT, WILLIAM ROBERT, AND JOHN F TAPLIN

Automatic feedback control. New York McGraw Hill Book Company Inc. 1951 412 p illus. 24 cm $8.50 5400

Contents: Introduction. Dynamical analysis of physical systems. The operational approach to feedback control. Frequency spectrum analysis. Feedback control loops. Multiple-loop feedback control systems. Design considerations. Nonlinearity and discontinuity. Servomechanisms. Pneumatically operated controllers. Temperature regulation. Speed governing. Pressure, flow and liquid level. Glossary. Appendix. Index.

Note: A practical treatment on the engineering level. The theoretical fundamentals are outlined, and mathematical methods of analysis of controlling systems are presented. However, the mathematical aspects are not pursued to the advanced regions, characteristic of many books on the feedback principle. Much attention is paid to practical aspects that would be of concern to engineers designing controls and servomechanisms. Though intended mainly for engineering students, the book is potentially useful to graduate engineers and others in industry who find themselves in need of an inclusive introductory treatment.

AHRENDT WILLIAM ROBERT

Servomechanism practice. New York Mc Graw Hill Book Company Inc., 1954 349 p. illus. 24 cm. $7.50 5401

Contents: Operation of a simple servomechanism. Potentiometers. Synchros and related error detectors. Double-speed synchronizing networks. Demodulators and modulators. Networks. Electronic amplifiers. Rate generators. Servomotors. Friction dampers. Magnetic amplifiers. Rotating amplifiers. Hydraulic systems. Design of servomechanisms. Manufacture of servomechanisms. Servomechanism adjustment and trouble shooting. Tests of servomechanisms. A typical servomechanism and its operation. Problems. Bibliography. Glossary of terms. Appendix. Index.

Note: A comparatively simple treatment of servomechanism principles and elements. Simplicity has been achieved largely by emphasizing servomechanism components, such as electronic amplifiers and hydraulic systems and by limiting the discussion of design to simple cases. The book offers the conscientious reader with practical interests a reliable explanation of the purpose of servomechanisms, how they work, what they consist of and gives him an insight into the design problems. Although developed in a formal college course and intended primarily for use as a text, it is suitable also for self-instruction.

BATCHER, RALPH R. AND WILLIAM MOULIC

The electronic control handbook. Pittsburgh Instruments Publishing Company 1946 344 p. illus. 23 cm. $2.00. 5402

Contents: Section I, Basic elements of control. Theory of control systems. Signal transmission systems. Section II, Conversion elements. Section III, Electronic modification circuits. Control amplifiers. Control oscillators. Counting and timing circuits. Electrical conversion circuits. Passive networks. Deviation detectors. Section IV, Actuating elements: Synchros and servo-systems. Solenoids and relays. Saturable reactors. Section V, Control motors. Welding control. Speed control. Miscellaneous electronic applications. Selected bibliography. Index.

Note: A compact treatment for engineers and others who have some knowledge of electrical principles. It covers briefly the general

NADAI, ARPÁD

Theory of flow and fracture of solids. Second edition. Volume one. New York McGraw Hill Book Company, Inc., 1950 572 p illus 23 cm. (Engineering Societies monographs, Ralph H Phelps, consulting editor) $12 00 5391

Contents (abridged) Part I, Deformation of solids, analysis of stress and strain Elastic and permanent deformation. Behavior of matter under high pressure. The ordered and unordered states of matter Crystalline structure in metals. Mechanism of plastic deformation in the grain structure. Theory of the tensile test. Mohr's representation of stress. Finite homogeneous strain without rotation. Finite plane strain. Vector geometry of stress and strain. Part II, The yielding of solids, particularly of the metals under simple states of stress. Rules in the new theories of flow of solids. Strain and flow figures. Compression. Torsion of a round bar Plastic bending of bars. Buckling after the yield point is exceeded. Part III, The elastic, the very viscous, the ideally plastic substance and some of their generalizations Isotropic elastic solid. Steady slow flow of very viscous substance. Ideally plastic substance. Constrained flow of ideally plastic material. Theory of the plastic deformation of flat rings or disks. The problem of plastic torsion. The flow layers in twisted bars of mild steel Theory of the surfaces of slip. Index.

Note. The author's *Plasticity* has long been recognized as major contribution to the knowledge of the behavior of solids when strained beyond the elastic limit. Much work has been done in the field in recent years because of the pertinence of the subject to the design of the machines operating at high speed or under high pressures, such as gas turbines consequently in the present revision under a new title, both the content and length of the original work have been extended to include phenomena associated with fracture as well as that associated with plastic deformation.

RINEHART, JOHN S, AND JOHN PEARSON

Behavior of metals under impulsive loads Cleveland The American Society for Metals, 1954 256 p illus 24 cm $5 50 5392

Contents Concept of impulsive loading. Properties of materials under conditions imposed by impulsive loading. Propagation of transient disturbances. Explosives and explosions. Characteristics of impulsive loads. Methods of observation and apparatus—nonphotographic. High speed photographic techniques. Inelastic behavior under nonimpulsive loading. Fracturing under impulsive loading. Plastic deformation under impulsive loading. Structural changes under impulsive loading. Behavior under impact. Practical application of explosives. Conclusions.

Note. How metals in the form of plates and other simple structures react to the kinds of high-transient loads applied by explosions is the main subject of this book. However the primary viewpoint is metallurgical rather than structural. Also, there are brief discussions of the effects of explosive charges on rocks, etc., as in blasting. In early chapters, the contrasting reactions of materials under static loads and impulsive loads are described, the laws governing the propagation of transient disturbances in elastic bodies are summarized, and certain fundamental properties of explosives are outlined. Most of the rest of the book is devoted to descriptions of experimental techniques and the results of experiments. The bibliography is limited to literature cited in the text nevertheless, it is an extensive one.

ROARK, RAYMOND J

Formulas for stress and strain Third edition New York McGraw Hill Book Company Inc. 1954 381 p illus. 24 cm. $7 50 5393

Contents Part Definitions and symbols Definitions. Symbols and units. Part II, Facts—principles—methods. The behavior of bodies under stress. Principles and analytical methods. Experimental methods. Properties of plane area. Part III, Formulas and examples Tension, compression, shear and combined stress. Beams—flexure of straight and curved bars. Torsion. Flat plates. Columns and other compression members. Pressure vessels—pipes. Bodies under direct bearing and shear stress Elastic stability Dynamic and temperature stresses. Miscellaneous tables. Index.

Note. A standard compilation of formulas and technical data relating to strength of materials. It is used primarily as reference handbook by structural engineers, machine designers, and engineering students. It includes, in addition to the tables of formulas, discussions of methods of calculating stress, strain and strength in various structural elements. In this edition, the scope and arrangement of the book are the same as in the second edition (1943), but tables and formulas have been revised and expanded to include the results of recent investigations and to conform with current specifications. Worked examples are again included, and the chapter bibliographies have been brought up to date.

SEELY, FRED B, AND JAMES O SMITH

Advanced mechanics of materials. Second edition New York John Wiley & Sons Inc., 1952 680 p illus 24 cm. $8 50 5394

Contents Part one, Preliminary considerations. Analysis of subject. Elementary stress formulas for static loads. Stresses and strains at a point. Theories of failure by yielding. Part two, Special topics on the strength and stiffness of members subjected to static loads: Shear center for a cross section of beam. Unsymmetrical bending. Curved flexural members. Beam on continuous elastic support. Flat plates. Torsional resistance of bars having non-circular cross sections. Thick-walled cylinders. Contact stresses. Part three, Localized stress—stress concentration: Values and significance of localized stresses in various members. Part four, Energy methods. Deflection of members and simple structures by Castigliano's theorem. Deflection of members and simple structures by unit load or dummy load method. Forces and moments in statically indeterminate members and structures. Part five, Influence of small inelastic strains on the load-carrying capacity of members. Effect of small inelastic strains in axially loaded members and in straight beams. Effect of small inelastic strains for combined bending and axial loads. Introduction to ultimate load analysis of statically indeterminate members. Part six, Introduction to instability—buckling loads. Buckling of cylindrical tubes under uniform external pressure. Appendixes A brief introduction to the mathematical theory of elasticity The elastic-membrane (soap-film) analogy for torsion. Properties of an area. Index.

Note. Although organized as textbook with numerous problems for the reader to solve, the content of this book is sufficiently advanced and comprehensive enough to make it useful to graduate engineers. Somewhat more advanced methods are covered than are found in introductory books, and some more specialized problems are analyzed. The first edition was published in 1931 and was the work of Professor Seely alone. Though intended for the same audience as the first edition, the book has now been rewritten throughout and is essentially new Although the theory of elasticity is not used in the body of the work, it is outlined in the first appendix, and compared t the method of ordinary mechanics in the analysis of stresses and strains.

SEELY, FRED B, AND JAMES O SMITH

Resistance of materials. Fourth edition. New York John Wiley & Sons Inc., 1956. 459 p illus. 22 cm $6.50 5395

Contents Part I, Elementary topics Relation among loads, stresses, and deformations. Torsion of cylindrical bars. Bending loads—stresses in beams. Deflection f beams. Combined axial tensile and bending loads. Buckling load—instability—columns. Statically indeterminate members. Relations between stresses at point on different planes passing through the point—combined static loads Repeated loads—fatigue of metals Dynamic loads. Part II, Additional topics Composite beams—reinforced-concrete beams. Unsymmetrical bending. Double-integration method for deflection of beams. Conjugate-beam method for deflection of beams. Continuous beams—three-moment theorem. Elastic location of load-resisting members Appendixes Properties of an area. Properties of rolled-steel sections. Index.

Note. An introductory textbook which offers broader treatment of the subject than is usual in books written for first courses. The first edition was written in 1945 and the third edition in 1947 In this fourth edition, written with the aid of co-author the book has been very extensively revised about, however changing its organization and level. The scope has been broadened to cover both elastic and inelastic deformation of structural members. There are now 434 figures and 464 problems for the student to solve.

SINGER, FERDINAND L

Strength of materials. New York Harper & Brothers, 1951 469 p illus 24 cm $6 50 5396

Contents. Simple stress. Riveted and welded joints. Torsion. Shear and moment in beams. Stresses in beams Beam deflections. Restrained beams. Continuous beams. Combined stresses. Reinforced

components are not discussed in detail); and the analysis and design of control systems. The authors are associated with the General Electric Company, and the work appears in the publisher "General Electric series."

COCKRELL, WILLIAM D

Industrial electronic control a guide to the understanding of electronic control circuits for industrial uses. Second edition. New York. McGraw Hill Book Company Inc., 1950. 355 p. illus. 21 cm. $6.00. 5408

Contents (abridged) Section I, Electron tubes: The vacuum tube. The gas-filled tube. Special tube types. The mechanical construction of tubes. Section II, Circuit components: Instruments and meters. Transformers and miscellaneous components. Combinations of component elements. Section III, Basic electronic circuits: Rectifier circuits and filters. Timing and wave-shaping circuits. Amplifier circuits and filters. Oscillator circuits. Section IV, Regulating and switching circuits. Regulating or closed-cycle control systems: Closed-cycle control systems. Bode diagrams and their use in system stabilization. Section V, Industrial electronic circuits. Direct-current photoelectric circuits and motor control. Alternating-current relay and power circuits. Resistance-welder controls and welder current regulating. Appendix. Index.

Note: A useful manual for plant engineers, electricians, maintenance men, and others whose work involves the operation or repair of electronically controlled machinery and systems. Although helpful for men with technical backgrounds, the treatment is largely nonmathematical. Basic elements and circuits are considered from the standpoints of characteristics and uses. Typical wiring diagrams are included. Important additions have been made in this edition, including the section on closed-cycle control systems.

DIEBOLD JOHN

Automation. The advent of the automatic factory New York D Van Nostrand Company Inc., 1952. 181 p. 22 cm. $3 75 5409

Contents: Note on the word automation. The problem of automation. Control and the computer. The redesign of product and process. Making machines automatic. Automatic handling of information. What will automation mean to business? Some social and economic effects of automation. Index.

Note: A study of the possibilities, limitations, and social and economic consequences of the revolutionary new machines of the electronic age and what they will mean in terms of jobs, cost of goods and services, standards of living, and increased leisure time. The author examines the effects upon engineering, education, management, and labor of the new electronic machines, some of them already available and in operation in offices and factories.

DRAPER, CHARLES STARK, AND OTHERS

Instrument engineering. By Charles Stark Draper Walter McKay and Sidney Lees. Volume I, Methods for describing the situations of instrument engineering. New York McGraw Hill Book Company Inc., 1952 269 p. illus. 29 cm. (McGraw Hill publications in aeronautical science Jerome C. Hunsaker consulting editor) $7.00. 5410

Contents: The operating system. Diagrams for describing operating systems. Performance equations and performance functions for operating systems. Static and dynamic operating conditions—static accuracy. Static performance. Dynamic performance. Derivation of performance equations. Dimensional analysis. Concepts and notation for the comparison of physical quantities. Concepts and notation for the description of generalized operating system performance. Applications of statistical methods to instrument engineering. Representation of physical situations by mathematical forms. Description of performance in terms of sinusoidal response characteristics. Bibliography. Index.

—— Volume II, Methods for associating mathematical solutions with common forms. New York. McGraw Hill Book Company Inc., 1953 827 p. illus. 29 cm. (McGraw Hill publications in aeronautical science Jerome C. Hunsaker consulting editor) $16.00 5411

Contents: Introduction. Nondimensionalization of linear integro-differential equations. Classical method of solving linear integro-differential equations. Operational methods of solving linear integro-differential equations with constant coefficients. The relating function, the weighting function, and the transfer function. Solutions associated with first-order differential equation forms. Solutions associated with second-order differential equation forms. Transient stability of mathematical solutions. Numerical methods of determining transient stability. Methods of solving third- and fourth-order characteristic equations. Graphical methods of determining transient stability. Graphical calculation of steady-state sinusoidal relating functions. Relating function forms from pulse function responses. Representation of solutions for differential equations with nonlinear terms of the rate-determined step type. Numerical analysis by the number series transformation method. Bibliography. Index.

—— Volume III Applications of the instrument engineering method. Part I, Measurement systems. New York McGraw Hill Book Company 1955 879 p. illus. 29 cm. (McGraw Hill publications in aeronautical science Jerome C. Hunsaker consulting editor) $17.50. 5412

Contents: Introduction. Concepts, definitions, diagrams and notation for describing operating components and operating systems. Indicators and measurement. Elements and components associated with instrument systems, by H. R. Brassard. Temperature-measuring instruments. Electromechanical measuring instruments. Pressure-measuring systems, by Y. T. Li. Integrators and differentiators. Vibration measurement and vibration isolation, by Y. T. Li. Bibliography. Index.

Note: A substantial contribution to the literature on indicating, measuring and control instruments. It is based in large part on the activities and experience of the Aircraft Instrument Section and the Instrumentation Laboratory of the Aeronautical Engineering Department of Massachusetts Institute of Technology. It covers theory, analytical methods, and applications. It is used both as a textbook for college students and as a reference book by graduate engineers. The second part of Volume III covering control systems is still to be published.

ECKMAN DONALD P

Industrial instrumentation. New York John Wiley & Sons, Inc., 1950. 396 p. illus. 21 cm. $7.00. 5413

Contents: Qualities of measurement. Expansion thermometers. Thermoelectric temperature measurement. Resistance thermometers. Radiation temperature measurement. Methods for composition analysis. Mechanical measurements. Measurement of pressure and vacuum. Measurement of head and level. Flow-metering. Process instrumentation. Appendix. Index.

Note: Although this book is essentially a text for undergraduate engineering students, it can be used also by industrial and chemical engineers as an introductory guide to the principles and methods of measurement which are of use in the processing and manufacturing industries. Emphasis is placed on instruments used in measuring temperature, pressure, rate of flow, and composition. Each class of instrument is preceded by a review of the physical principles involved; and the construction, operation, and applications of selected instruments are described. Schematic diagrams and review problems are included.

ECKMAN DONALD P

Principles of industrial process control. New York John Wiley & Sons Inc., 1945 237 p. illus. 22 cm. $5.50. 5414

Contents: The art and science of control. Measuring means of industrial controllers. Characteristics of measuring means. Modes of automatic control. Final control elements. Process characteristics. Theory of automatic control. Quality of automatic control. Application control engineering. Automatic control systems. Maintenance of [illegible] control. Glossary of terms used in automatic control. Index.

Note: An introductory treatment, for engineering students and others with considerable technical education, of the basic principles

eral principles of control systems, then explains the common circuits and circuit elements and states their characteristics and uses. Many illustrations and diagrams are included. The chapter references together with the bibliography direct the reader to sources of more precise information on specialized topics such as the design details of control equipment.

BROMBACHER, W G, AND T W LASHOF

Bibliography and index on dynamic pressure measurement Washington, D C. Government Printing Office, 1955 124 p 26 cm. (United States National Bureau of Standards Circular 558) $0 75 5403

Contents: Introduction. Bibliography Author index. Subject index.

Note. One of a series of reports which are the results of surveys conducted as part of a program of instrumentation research and development co-operatively sponsored at the National Bureau of Standards, by the Atomic Energy Commission, the Office of N val Research and the Air Research and Development Command. The scope of this particular survey was limited to the preparation of this bibliography of 850 books and articles on the subject of dynamic pressure measurement and related subjects, including static pressure measurement and general information on the components of instruments. Fields of application covered in the bibliography are blast pressures, underwater explosions, automotive powerplants, ballistics, meteorology aeronautics, physiology and, to lesser extent, applications in acoustics, geophysics, industrial and miscellaneous explosions, hydraulics, structures, high pressure, and high vacuum. The entries are arranged chronologically by year from 1903 through 1954 and, within the year alphabetically

BROMBACHER, W G

Guide to instrumentation literature, by W G Brombacher, Julian F Smith and Lyman M Van der Pyl Washington, D C. Government Printing Office 1955 156 p. 26 cm. (United States. National Bureau of Standards Circular 567) $1 00 5404

Contents. Introduction. Instrumentation literature Abstract and review journals. Bibliographies. Books. Dissertations and theses, sources and guides. Directories of manufacturers, buyers' guides, exhibit guides. Guides to technical literature. Indexes to technical literature. Patents. Periodicals. Specification lists and handbooks. Author index. Subject index.

Note. This compilation of over 1,200 references forms useful guide to the literature of instrumentation, which is defined as comprising "the art and science of designing, making, applying, and operating instruments. Articles published in periodicals are not separately included, but indexes and abstracts of such articles on given subject are indicated in the subject index. Foreign-language references are not covered so thoroughly as English-language references. Books and reference works are listed for about 20 years back, although most are less than 10 years old periodicals and bibliographies are listed back to their beginning dates. The publication, which is a combination and revision and extension of 1945 pamphlet of the American Society of Mechanical Engineers and a 1952 report of the National Burea of Standards, is issued to serve esearch investigators, instrument users, and others wishing to utilize the extensive and scattered literature of instrumentation.

BROWN, GORDON STANLEY, AND DONALD P CAMPBELL

Principles of servomechanisms dynamics and synthesis of closed loop control systems New York John Wiley & Sons Inc., 1948 400 p illus 24 cm. $8 50 5405

Contents. Outline of subject. Dynamics of elementary control systems. Transient response using the Laplace transform. Sinusoidal response of closed-loop systems. System diagrams, equivalent circuits, and block diagrams. Introduction to synthesis, determining the gain constant *K* Methods of *G* function synthesis—linear coordinates. Methods of *G* function synthesis—logarithmic coordinates. Systems subjected t multiple disturbances. Experimental studies in servomechanisms. Method for approximating the transient response from frequency response. Table of SIN*x*/*x*. Problems. Bibliography Index.

Note. An important addition to the literature of servomechanisms. It is designed primarily for senior and graduate engineering students, but, since it is written from a fresh viewpoint and contains some material not published hitherto, it will be of interest to persons already engaged in research and engineering design. The treatment is chiefly mathematical, and there is virtually no discussion of mechanical components of control systems such as motors, relays, etc. Both authors are members of the faculty at Massachusetts Institute of Technology and the first mentioned is head of the Electrical Engineering Department.

BRUNS, ROBERT A., AND ROBERT M SAUNDERS

Analysis of feedback control systems, servomechanisms and automatic regulators. New York McGraw Hill Book Company, Inc., 1955 383 p illus 24 cm. (McGraw Hill electrical and electronic engineering series, Frederick E Terman, consulting editor) $8 50 5406

Contents. Introduction. Part I, Components: Mechanical systems. Electrical actuators. Hydraulic elements. Pneumatic elements. Electric circuit elements. Electronic amplifiers. Magnetic amplifiers. Dynamo-electric amplifiers. Transducers, data transmitters, and error detectors. Reference standards. Part II, Feedback-system theory Specifications and stability Block diagrams and network reduction. Experimental methods for obtaining transfer functions. Transient response from frequency-response data. Nonlinear systems. Discontinuous systems. Appendix. Stability criterion for multiple-loop systems. Index.

Note. This book is designed as an introduction for advanced undergraduate students of engineering and graduat engineers. In contrast with some other books on control system analysis, the essential viewpoint is practical, and the mathematics is held to relatively easy level. The Laplace transform, for instance, is not used. Essentially the book teaches the a-c steady-state method of analysis and makes only incidental reference to other methods. More than two-thirds of the space is devoted to system components, and these are discussed as to mechanical and electrical principles and uses in feedback control systems and are analyzed in terms of their transfer functions. Most of the book relates to linear systems the short chapter on nonlinear systems serves mainly to give the reader preview of methods of analysis of them.

CHESTNUT, HAROLD, AND ROBERT W MAYER

Servomechanisms and regulating system design. New York John Wiley & Sons, Inc., 1951–55 2 v illus 23 cm Vol. I $9.25, vol. II $8 50 5407

Contents. Volume I: The automatic control problem. Manipulation of complex numbers. Solution of linear differential equations. Laplace transforms for the solution of linear differential equations. Steady-state operation with sinusoidal driving functions. Methods of determining system stability Typical control elements and their transfer functions. Types of servomechanisms and control systems. Complex plane representation of feedback control system performance. Design use of complex plane plot to improve system performance. Attenuation concepts for use in feedback control system design. Application of attenuation-phase diagrams to feedback control design problems. Multiple-loop and multiple-input feedback control systems. Comparison of steady-state and transient performance of servomechanisms. Bibliography Index. Volume II Measurement techniques. Influence of input characteristics on control system design. Selection of controlled system power element with proper rating. Networks for obtaining desired attenuation-frequency characteristics. Amplifier design. All alternating-current servomechanism operation. Linearization of non-linear elements for small departures. Linearization of non-linear elements for large departures. Application of non-linear elements to control systems. Bibliography Index.

Note. The first volume of this two-volume work is directed to readers, particularly young engineers who are making their first acquaintance with the field. The necessary mathematical background is covered in five of its chapters. Then the basic approaches to the analysis of servomechanisms are discussed with emphasis on method of synthesis that is based on the attenuation-frequency theorems of Bode. The second volume is addressed to engineers who have mastered the first volume or who have acquired the equivalent in basic knowledge elsewhere. It is devoted to the more advanced aspects of servomechanism and regulator design. Problems of special concern t design engineers, such as reduction of errors due to noise introduced by it the selection of system elements (however

... -making devices. Gaseous electronic switching devices. Electronic switching circuits. Power amplifiers. Control circuit fundamentals. D.c. motor control circuits. Motor acceleration. Speed control—rheostatic and switching methods. Speed control with auxiliary power converters. Motor braking. Feedback control systems. Motor protection. Appendices. Index.

Note. A senior text for students of electrical engineering who have already had courses in circuit theory, electric machinery, electronics, and linear differential equations. Chapter titles indicate the scope of the material covered. Most topics are developed from basic theory, both analytically and graphically. Feedback systems are considered and servomechanisms are mentioned, but the major emphasis of the book is on control systems having no feedback. Each chapter has a set of problems and a selected bibliography citing references up through 1951. The author is Professor of Electrical Engineering at Rensselaer Polytechnical Institute.

LaJoy, Millard H.
Industrial automatic controls. New York Prentice-Hall, Inc., 1954 278 p. illus. 22 cm. $7.00. 5421

Contents: Introduction to the concept of automatic control. Two-position control. Proportional control. Floating mode of control. Rate mode of control. Controller combinations. Pneumatic control circuits. Hydraulic control circuits. Electric and electronic circuits. Applications. Theoretical consideration of the process. Controlled system analysis. Bibliography. Glossary of terms. Index.

Note. A comparatively simple introduction to automatic control principles and to the basic types of controllers. Considerable descriptive matter is included, but the book cannot be fairly described as a descriptive text. The emphasis is definitely on principles and analysis, but only the more elementary aspects are covered. Considerable facility in the handling of algebraic equations is essential for full comprehension of such chapters as the one on theoretical considerations, but on the whole the mathematics is much simpler than most of the available books on this subject. The book should serve well as an exposition for technicians employed in industry, undergraduate students, and even for graduate engineers whose work requires only a general knowledge of automatic control. The author is a member of the engineering faculty of the University of Minnesota.

Laning, J. Halcombe, jr. and Richard H. Battin
Random processes in automatic control. New York McGraw Hill Book Company Inc., 1956 434 p. illus. 24 cm. (McGraw Hill series in control systems engineering John R. Ragazzini and William E. Vannah, consulting editors) $10.00. 5422

Contents: Introduction. Basic concepts of probability theory. The statistical description of random processes. The shot effect and Gaussian random processes. Analysis of effects of time-invariant linear systems on stationary random processes. Mean-squared error analysis for nonstationary problems. Optimum linear least-squares smoothing and prediction for stationary random processes. Optimum operations with finite data. Appendices. Bibliography. Index.

Note: A graduate-level text developed at Massachusetts Institute of Technology. Its first four chapters constitute an exposition of basic probability theory and statistical theory useful in the understanding of the analysis of random processes or "noise." The chapters that follow illustrate application of this basic theory and the statistical methods to the analytical study of a variety of problems in automatic control and to the design of control systems to cope with random events. The 10 appendixes contain a variety of material, including a discussion of analogue computers, mathematical proof of the method of adjoint systems—a method developed by the authors of the text—and a solution of the equation $F(s) = 0$. Other original methods developed by the authors are introduced in other chapters. The book is of interest to both scientists and engineers working in automatic control design or in other fields where a basic knowledge of theory applicable to random processes is useful.

Lauer, Henri, and others
Servomechanism fundamentals, by Henri Lauer Robert Lesnick, and Leslie E. Matson. New York McGraw Hill Book Company Inc., 1947 277 p. illus. 23 cm. $5.50 5423

Contents. Elementary forms of control systems. Servo system follow-up links. Fundamentals of mechanics and electricity. Analysis of servomechanisms with viscous output damping. Analysis of servomechanisms with error-rate damping. Analysis of servomechanisms with combined viscous output damping and error-rate damping. Error-rate stabilization networks. Analysis of servomechanisms with integral control. Transfer function analysis of servomechanisms. Typical design calculations and general considerations. Index.

Note. With the increasing use of automatic control and remote control in industry there has arisen a need for books that explain the principles of servomechanisms. This book is designed as an introduction to the subject for both engineering students and graduate students. The merit of the book is in the thorough treatment of analyzing by the transient analysis method, the design and performance of various fundamental types of servomechanisms. One chapter has been included principally for comparison purposes. This is the chapter devoted to the transfer function method of analysis. The principles of *follow-up links*, such as differential gears, translating devices and synchro motors and generators are outlined, but there is no attempt to cover the design of servomechanism components, such as motors, gears, and other mechanical parts.

Markus, John and Vin Zeluff
Handbook of industrial electronic control circuits. New York McGraw Hill Book Company Inc. 1956 352 p. illus. 29 cm. $8.75 5424

Contents: Amplifier circuits. Capacitance control circuits. Cathode-ray control circuits. Counting circuits. Direct-current amplifier circuits. Measuring circuits. Metal detector circuits. Motor control circuits. Multivibrator circuits. Oscillator circuits. Photoelectric circuits. Power supply circuits. Radiation circuits. Remote control circuits. Sorting circuits. Temperature control circuits. Timing circuits. Transistor circuits. Ultrasonic control circuits. Welding control circuits. Author index. Subject index.

Note. About 300 descriptions of circuits of interest in industrial electronic control applications, which were published in the periodical *Electronics* during the period 1948–1955, have been collected in this volume and arranged under the headings given in the above Contents. Each circuit is concisely described in the terminology of the field, and one or more wiring diagrams are included. A reference is given in each case to the original publication. A very detailed subject index is provided. Although the book contains no previously unpublished circuits, by virtue of being well indexed and easier to handle, it makes the material more available. It is a sequel to the same editors' *Handbook of industrial electronic circuits*, New York, 1948.

Nixon, Floyd E.
Principles of automatic controls. New York Prentice Hall, Inc., 1953 409 p. illus. 22 cm. (Prentice Hall electrical engineering series W. L. Everitt editor) $7.50 5425

Contents: Automatic control systems. Application of mathematics to control systems. The Laplace transform. Block diagram notation. The Nyquist criterion. Application of the Nyquist criterion to typical open-loop transfer functions. Design considerations. Other methods of analyzing the open-loop function. Types of compensation. Effect of noise and output disturbances. Interpreting Nyquist loci. Numerical integration. Automatic computers. Methods for analyzing transient response data. Nonlinear systems. Appendixes. Bibliography. Index.

Note. A broad introduction to the basic principles of automatic controls and to the details of typical simple systems. The Nyquist stability criterion is emphasized. Except for the last chapter which is a brief one, only linear systems are discussed. No mathematics beyond introductory calculus is necessary to understand the main part of the book. More difficult mathematics is presented in the appendixes. The book is organized as a text but is suitable for reading without the aid of an instructor by practicing engineers and other readers familiar with simple engineering mathematics and technical terminology. The chapter on automatic computers is a quick review of the operating principles of both digital and analog computers. The author is on the engineering staff of the Glenn L. Martin Company.

Oldenburger, Rufus editor
Frequency response. New York The Macmillan Company 1956 372 p. illus. 29 cm. $7.50. 5426

of servomechanisms and automatic controls. The theory of the subject is treated in considerable detail, and is illustrated with diagrams of ideal control mechanisms and ith graphs. Some practical aspects of the subject, such as maintenance and servicing of control systems, are discussed briefly Chapter bibliographies are included. The author is Associate Professor of Mechanical Engineering at Case Institute of Technology

EVANS, WALTER R

Control-system dynamics. New York Mc Graw Hill Book Company, Inc. 1954 282 p illus. 24 cm. (McGraw Hill electrical and electronic engineering series, Frederick Emmons Terman, consulting editor) $7 00 5415

Contents Terminology The dynamics problem. Description of typical components. Fundamentals of transient response. Meaning and use of transfer functions. The frequency-response method. Transient response from frequency esponse. The rootlocus method. Multiple-loop systems. Circuit analysis. Use of determinants. Transfer functions and transient response. Graphical analysis f nonlinear systems. Appendixes. Problems. Bibliography Index.

Note An outstanding contribution to the literature of control system analysis, written so as to be useful both to advanced students and to graduate engineers. Some introductory and conventional material is contained in the early chapters. However the chapter on the root locus method describes method developed by the author himself From this chapter onwards, the topics discussed and the level of treatment are such that graduate engineers will be interested. One of the special features of value to nonstudent readers especially is the inclusion of short synopses at the beginning f every section, which make it easy to select the sections of interest. The "Spirule described in the third appendix is plastic device designed for the rapid addition of angles and multiplication of length of vectors. It is especially useful in the calculations invol ed in the author's root locus method.

FETT, GILBERT HOWARD

Feedback control systems New York Prentice Hall, Inc. 1954 361 p illus. 23 cm. (Prentice Hall electrical engineering series W L Everitt, editor) $8 50 5416

Contents. Table of symbols. Introduction to control devices. Components of feedback control system. Steady state and transient solutions of feedback control system differential equations. Nyquist criterion for stability Stability diagrams. Analysis and synthesis of complex control systems. Nonlinear feedback control system analysis. Appendix LaPlace transforms. Roots of algebraic equations. Index.

Note An introduction t the components, analysis and synthesis of automatic control systems based on the feedback principle. It is addressed mainly to advanced students of engineering in colleges, and the chapters include the traditional problems for students to solve. The several standard methods for writing and solving the differential equation of a feedback control system are presented. The Nyquist method is given special emphasis, and the chapter devoted to it is one of the longer ones in the book. This chapter the chapter on stability diagrams, and the final chapter in hich methods of analysis applicable to nonlinear feedback control systems are developed, are of interest to graduate engineers as well as to students. The author is Professor of Electrical Engineering in the University of Illinois.

FLUGGE-LOTZ, IRMGARD

Discontinuous automatic control Princeton Princeton University Press 1953 168 p illus 25 cm $5 00 5417

Contents Part I, Discontinuous control of moving body with a single degree of freedom The differential equation of motion. Description of the controlling mechanism. The solutions of the differential equation of motion and its continuity qualities. Complete theory of the motion with position control. Complete theory of the motion with velocity control. Part II, Influence of control mechanism imperfections on the motion of body with single degree of freedom Effects upon motion with position control. Effects upon motion with velocity control. Part III, Discontinuous control of moving body ith more than one degree of freedom The longitudinal motion of missile (discontinuous position control) Appendixes Tables. Construction of logarithmic spirals by an approximate method. Index.

Note. In this book is presented new and valuable method of analysis of systems of discontinuous automatic control. Because the method is largely graphical it avoids much of the involved and difficult computations hich has heretofore been necessary in the analysis of this kind of ystem. Most of the book is devoted to the analysis of systems controlling bodies ith one degree of freedom, but in the third part the author has presented an attack on the discontinuous control of guided missile having 6 degrees of freedom. This last part illustrates the wide range of potential applications of discontinuous systems.

GEYGER, WILLIAM A.

Magnetic amplifier circuits, basic principles, characteristics, and applications. New York McGraw Hill Book Company, Inc., 1954 277 p illus. 24 cm. $6 00 5418

Contents. Introduction. Historical development of magnetic-amplifier circuits. Magnetic-amplifier elements. Basic nonfeedback types of magnetic-amplifier circuits. Operating conditions of nonfeedback magnetic-amplifier circuits. Nonpolarized, polarized, and doubledirectional types of nonfeedback magnetic-amplifier circuits. Basic external-feedback types of magnetic-amplifier circuits. Development f external-feedback types of magnetic-amplifier circuits. Doubledirectional external-feedback circuits with two saturable-reactor elements. Doubledirectional external-feedback circuits ith four saturable-reactor elements. Basic single-core internal-feedback magnetic-amplifier circuits. Basic two-core internal-feedback types of magnetic-amplifier circuits. Full-wave types of doubledirectional internal-feedback circuits ith two saturable-reactor elements. Half-wave types of doubledirectional internal-feedback circuits with two saturable-reactor elements. Doubledirectional internal-feedback circuits with four saturable-reactor elements. Magnetic-amplifier circuits of the self-balancing potentiometer type. Second-harmonic-type magnetic-amplifier circuits. Technical properties of magnetic amplifiers. Typical applications of magnetic amplifiers. Author index. Subject index.

Note: A useful presentation of information on the basic principles and amplifier applications of saturable-core reactors. It is based on the patent and periodical literature, including the author's own extensive publications, issued through approximately December, 1953 The information has been well organized and is conveyed in a clear style with special attention to standard nomenclature and symbols. Although there are diagrams of many typical circuits, the book is not cyclopedic in this respect. In fact, the author has described his purpose as to indicate method of advanced thinking that can give clear and comparatively simple picture of magnetic-amplifier circuits rather than just to describe multitude of specific arrangements. Each chapter contains an extensive list of literature references.

HOLZBOCK, WERNER G

Instruments for measurement and control. New York Reinhold Publishing Corporation, 1955 371 p illus 23 cm. $10.00 5419

Contents Temperature. Humidity and moisture. Pressure. Flow Liquid level. Density Viscosity Speed. Analysis. Automatic controller action. Electric controllers. Self-operated, pneumatic and hydraulic controllers. Time function controllers. Final control elements. Trends. Glossary Index.

Note The author of this book describes its scope in these words: "This book is concerned with those industrial instruments commonly used for remote reading or remote automatic action hile the industrial plant, and includes such elements as are essential for this purpose." The discussions of instruments and control devices are addressed to persons ith technical education and experience who are not instrument specialists. Operating principles, typical mechanisms and wiring circuits, inherent inaccuracies and how they are compensated for or minimized, are all discussed. The book is about commercially vailable instruments, but it is not descriptive manual or catalog of such. Rather the types and varieties of instruments are discussed with reference to selected commercial instruments. There are no literature references. It is of interest to engineers who are responsible for the selection of instruments and related controlling mechanisms, and to others in need of an over-all iew of the field.

JONES, RICHARD W

Electric control systems. Third edition. New York John Wiley & Sons 1953 511 p. illus. 24 cm. $7 75 5420

Contents Introduction. Dynamics of the motor and load. D-C motor characteristics. A-C motor characteristics. Electromagnetic

John Wiley & Sons, Inc., 1955 545 p. illus. 24 cm. $13.50. 5430

Contents: Magnetics: Introduction to the theory of magnetism, by W. Morrill. Magnetic materials, by W. Morrill. Magnetic testing, by H. F. Storm. Theory of magnetic amplifiers, by H. F. Storm, by E. J. Kurz. Theory of magnetic amplifiers. The saturable reactor. Introduction to the theory of magnetic amplifiers. The saturable reactor with resistive load, steady-state operation with free even-harmonic currents; the series-connected saturable reactor—the parallel-connected saturable reactor. Static characteristics of the saturable reactor with resistive load and free even-harmonic currents—with reactor with resistive load and suppressed even-harmonic currents. The shunt-resistive load and suppressed even-harmonic currents. Transient response of the saturable reactor with resistive load. Steady-state operation of the saturable reactor with inductive D-C load. Transient operation of the saturable reactor with inductive D-C load. Transient operation of the saturable reactor with inductive D-C load. Saturable reactors with external feedback. Saturable reactors with feedback; transient operation. Relations between saturable reactors with external feedback and with blocked intrinsic feedback (A-C amplifiers). The amplistat with zero total feedback ($\lambda = 0$). The amplistat with finite total feedback ($\lambda \neq 0$). Characteristics of amplistats with resistive load. Amplistats with suppressed alternating components of control currents. Magnetic amplifiers with inductive, D-C load. Components: Core and coil materials, by P. A. Vance. Metallic rectifiers, by E. A. Karg. Applications: Magnetic amplifiers for radiotelephony, by E. F. Uschmann. Applications of saturable reactors, by W. D. Cockrell. Basic applications of single-ended amplistats, by H. M. Ogle. Applications of double-ended (push-pull) amplistats, by H. M. Ogle. Special and equipment, by H. M. Ogle. Alternator voltage regulation, by E. H. Bratton. Saturating reactors: Nonlinear A-C reactors in circuit elements, by H. W. Lord. Bibliography. Name index for bibliography. Subject index.

Note: An authoritative, well-organized treatment of saturating-type power amplifiers. The chief author is a specialist in magnetic amplifiers on the staff of the General Engineering Laboratory of the General Electric Company and the contributors of special chapters are associated with the same company. The level of treatment is similar to that of graduate engineers who are beginning to work in the analysis and design of magnetic amplifiers or in fields where these applications of this device have been developed. Theory and analysis are emphasized, but many other aspects are covered also, including even some manufacturing techniques. The bibliography together with an author index runs to 4 pages.

Thaler, George J

Elements of servomechanism theory New York, McGraw Hill Book Company Inc., 1955. 282 p. illus. 24 cm. (McGraw Hill electrical and electronic engineering series Frederick E. Terman, consulting editor) $5.00. 5431

Contents: Introduction. General aspects of analysis and design. Transient analysis of servomechanisms. Transfer functions. Transfer-function plots. Analysis of single-loop systems. Methods of meeting performance specifications. Gain adjustment of servomechanisms. Series compensation of servomechanisms. Feedback compensation of servomechanisms. Introduction to advanced topics—linear theory—nonlinear systems. Appendixes. Tables of numerical data. Servo components. An introduction to the Laplace transformation. Index.

Note: Both operational calculus and the theory of complex variables have been avoided in this introduction to servomechanism theory; hence, the book is suitable for undergraduate students, technicians and engineers who cannot understand the standard treatises because of their higher mathematical level. The logarithmic and polar approaches to servomechanism analysis and design are introduced in the same chapter and are, to use the author's words, "integrated and compared." The two final chapters on advanced topics are relatively brief and are intended to accomplish little more than give the reader a brief preview of what servomechanism theory at a professional level is about. The author is a faculty member of the United States Naval Postgraduate School.

Thaler, George J and Robert G Brown

Servomechanism analysis. New York McGraw Hill Book Company Inc., 1953 414 p. illus. 24 cm. $8.00 5432

Contents: General background. The Laplace transformation. Equations of physical systems. Transient analysis of servomechanisms. Transfer functions. Graphical representation of transfer functions. Analysis of servomechanism performance from equations and transfer-function plots. Introduction to design. Gain adjustment. Series compensation. Parallel compensation. Logarithmic coordinates in analysis and design. Relay servomechanisms. The root-locus method. Appendixes. Tables. Error detectors. Controllers. Servomotors. Component-ing devices. Bibliography. Index.

Note: Analysis of servomechanisms by mathematical methods is the main topic of this book. Various methods of analysis are discussed, and the applications and limitations of each are indicated. Special emphasis is given to transfer-function analysis and to the root-locus methods of design. The special problems of analyzing relay servomechanisms are adequately covered. The book is introductory to the subject and is intended for advanced undergraduate and postgraduate engineering students. A bibliography of more than 200 citations is included.

Truxal John G

Automatic feedback control system synthesis. New York McGraw Hill Book Company Inc., 1955 675 p. illus. 24 cm. (McGraw Hill Electrical and electronic engineering series Frederick Emmons Terman consulting editor) $12.50. 5433

Contents: Introduction. Signal-flow diagrams and feedback theory. Synthesis of RC networks. Root-locus methods. Synthesis through pole-zero configurations. Design in the plane. Principles of statistical design. Application of statistical design principles. Sampled-data control systems. Nonlinear systems and describing-function analysis. Phase-plane analysis. Index.

Note: An important addition to the literature of feedback control systems. Its principal object is to provide engineers with the knowledge that is necessary to take full advantage of the Laplace transform in designing feedback control systems; hence, the chapters on synthesis of RC networks, root loci, statistical methods, etc. The author is frankly critical of some of the traditional approaches to design in this field and goes into considerable detail on how their disadvantages and limitations can be avoided. Most of the space is devoted to synthesis of linear systems fed on continuous signals, but linear systems based on sampling of input data and nonlinear systems are considered at some length in the two final chapters. The book is suitable for use as a graduate-level text and as a guide to independent study by graduate engineers already at work in the field.

Tsien H. S

Engineering cybernetics. New York McGraw Hill Book Company Inc., 1954 289 p. illus. 24 cm. $7.00 5434

Contents: Introduction. Method of Laplace transform. Input, output, and transfer function. Feedback servomechanism. Noninteracting controls. Alternating-current servomechanisms and oscillating control servomechanisms. Sampling servomechanisms. Linear systems with time lag. Linear systems with stationary random inputs. Relay servomechanisms. Nonlinear systems. Linear system with variable coefficients. Control design by perturbation theory. Control design with specified criteria. Optimalizing control. Filtering of noise. Ultrastability and multistability. Control of error. Index.

Note: The author of this book has approached automatic control in the spirit of Norbert Wiener's Cybernetics, or control and communication in the animal and the machine, New York, 1948. He has emphasized fundamental qualitative aspects of the characteristics of control systems and has dealt at length with such basic matters as the mathematical analysis of feedback. He has purposely ignored specific practical problems and even in the chapter on relay servomechanisms, he has not described a practical relay. Engineers who are concerned on a research level with the study and design of controlling mechanisms (and of course engineering graduates preparing for such work) are the intended audience.

Van Valkenburgh Nooger & Neville, Inc

Basic synchros and servomechanisms. New York John F Rider Inc., 1955 2 v in 1 23 cm. $6.95 5435

Note: This work is an introductory text intended for study by men with an elementary knowledge of electricity and electronics. The exposition is simple and direct without recourse to mathe-

Contents Part I, Fundamentals. The Regeneration theory by H. Nyquist. Early history of the frequency-response field, by A. C. Hall. The frequency-response method—a brief survey by R. H. Macmillan. Frequency-response data presentation, standards and design criteria, by R. Oldenburger A bibliography of the frequency-response method as applied to automatic feedback-control systems, by A. M. Fuchs. Analysis f regulating systems with particular reference to speed control, by R. H. Macmillan. Part II, F equency-response aids Frequency-response computational aids, by K. Izawa. Sine-wave generators, by D W St. Clair and others. Part III, Servo airplane and power system applications The frequency-response approach to the design f mechanical servo, by H. A. Helm. Application of frequency-analysis techniques to hydraulic control systems, by A. C. Hall. Frequency-response method applied to the study of turbine regulation in the Swedish power system, by V Oja. Experimental flight methods for evaluating frequency-response characteristics of aircraft, by G. A. Smith and W C. Triplett. Part IV Process control Control-system behavior expressed as a deviation ratio, by J M. L. Janssen. Frequency-response analysis and controllability of a chemical plant, by A. R. Aikman. Frequency-response analysis f continuous flow systems, by H. Kramers and G. Alberda. Response and phase-lag of thermometers, by E. G. J Eykman and C. J D M. Verhagen. Part V Transient response: Determination of transient response from frequency response, by A. Leonhard. The use f zeros and poles for frequency esponse or transient response, by W R. Evans. A method of estimating dynamic characteristics of physical systems, by S. Lees. Part VI, Optimum controls A uniform approach to the optimum adjustment f control loops, by R. C. Oldenbourgh and H. Sartorius. Synthesis of optimum feedback systems satisfying a power limitation, by J H. Westcott. Part VII, Nonlinear techniques. On some nonlinear phenomena in regulatory systems, by L. C. Goldfarb. Recent advances in nonlinear servo theory by J M. Loeb. Approximate frequency-response methods for representing saturation and dead band, by H. Chestnut. Stability characteristics of closed-loop systems with dead band, by C. H. Thomas. Part VIII, Sampling controls Frequency method of analyzing intermittent regulating systems, by YA. Z. Tsypkin. The pulse transfer function and its application to sampling servosystems, by R. H. Barker Part IX, Statistical methods A statistical approach to servomechanisms and egulators, by M. J Pelegrin. Index of authors. Index of subjects.

Note A notable collection f research papers contributed by engineers and scientists of the United States of America and other countries. All but 10 of the papers were presented at a Frequency Response Symposium sponsored by the American Society of Mechanical Engineers in 1953. The papers presented at this meeting are accompanied by transcripts of the discussions and of the authors' responses to the discussions. Bibliographies are included.

RADIO–ELECTRONICS–TELEVISION MANUFACTURERS ASSOCIATION ENGINEERING DEPARTMENT

Proceedings of the RETMA symposium on automation, "Automation for electronics and electronics for automation" University of Pennsylvania, Philadelphia, Pennsylvania, September 26 and 27 1955 New York Engineering Publishers, 1956 114 p illus 28 cm $5 00 5427

Contents Session I, Mechanization for high volume assembly A system for automatic production of electronic assemblies, by C. Brunetti and G. Kwasniewski. Design and manufacture of automation components, by L. Kahn. Obtaining reliability and versatility in high production mechanized assembly equipment, by J Harrington, Jr Sylvania automatic assembly equipment and its application to 5-tube AC/DC radio chassis, by C. F Carlson. Session II, Data sensing, processing and utilization Milestones of automation, by D A. Griffin. Factory automation by digital control, by J A. Potter An automated ticket reservation system, by C. Andrews. Automatic warehousing, by G. Kittredge. Automation of non-circular gear cutting by UNIVAC-120, by A. H. Stillman and F W Cunningham. Session III, The future of automation Panel discussion, by J D O'Connell and others. Session IV Automation for low volume production "Mini-A-Matic," machine for short run production, by D F Pennie. A functional approach to automatic systems and standardization, by F C. Collins and K. Henkoffer. The production of electronic circuits by mechanized wiring, by S. J Begun and F Rosenthal. Automation and the subminiature system, by R. J. Roman. Session V Redesign for automation of components and products: Redesign for automatic production of electronic equipment, by M. R. Johnson. Signal Corps component program for automation, by S. F Danko and R. A. Gerhold. Automation from the component manufacturers' viewpoint, by J D Heibel and J. H. Fetter. Philosophy of component design and packaging for mechanized assembly of printed wiring boards, by R. B. Lynn.

Note: This collection of papers offers specific descriptions of automation techniques and the machines for carrying them out, which have been developed in the electronics manufacturing industries. The authors are associated with such firms as General Mills, Sylvania Electric Products, International Business Machines, Sperry-Rand, and Radio Corporation of America, and in majority of instances they have described products or automation activities of their companies. The volume contains, in addition to the papers themselves, excerpts of the discussions at the meeting. These include discussions of the individual papers and also lengthy panel discussion of the future of automation.

SHANNON, C E, AND J MCCARTHY, editors

Automata studies. Princeton Princeton University Press, 1956 285 p illus. 26 cm. (Annals of mathematics studies edited by Emil Artin and Marston Morse) $4.00. 5428

Contents, Part I, Finite automata: Representation of events in nerve nets and finite automata, by S. C. Kleene. Probabilistic logics and the synthesis of reliable organisms from unreliable components, by J von Neumann. Some uneconomical robots, by J T Culbertson. Some universal elements for finite automata, by M. L. Minsky Gedanken-experiments on sequential machines, by E. F Moore. Part II, Turing machines A universal turing machine with two internal states, by C. E. Shannon. A note on universal turing machines, by M. D Davis. The inversion of functions defined by turing machines, by J McCarthy Computability by probabilistic machines, by K. de Leeuw and others. Part III, Synthesis of automata: Design for an intelligence-amplifier, by W R. Ashby The epistemological problem for automata, by D M. MacKay Conditional probability machines and conditioned reflexes, by A. M. Uttley Temporal and spatial patterns in a conditional probability machine, by A. M. Uttley

Note. The original studies in this volume pertain to the area of technical development occupied by such devices as electronic computers, automatic control systems and machines that "think," and to the related area of theory containing such systems of ideas as game theory and information theory The majority of the papers lean heavily on mathematical analysis. However some of them are primarily philosophic in tone, hile the third group on synthesis of automata is devoted primarily to design criteria and methods of solving design problems. The volume contains something of interest to graduate scientists in many fields of scientific research and applications.

SHENKER, HENRY, AND OTHERS

Reference tables for thermocouples. By Henry Shenker, John I Lauritzen, Jr., Robert J Corruccini, and S T Lonberger Washington, D C. Government Printing Office 1955 84 p 26 cm. (United States. National Bureau of Standards. Circular 561) $0 50 5429

Contents Introduction. Part I, Celsius (centigrade) tables. Fahrenheit tables.

Note. The temperature—electromotive-force relationship for a thermocouple in general cannot be expressed by simple equation. It is convenient, therefore, to have empirical tables giving the temperature—electromotive-force relationship for the various types of commercially available thermocouples. For any thermocouple type, table is based on calibrations of representative thermocouples at sufficient points to yield temperature—electromotive-force plot characteristic of the material. In this circular expanded reference tables for platinum ersus platinum—10-percent rhodium, platinum versus platinum—13-percent rhodium, chromel-alumel, iron-constantan (modified 1913) copper-constantan, and chromel-constantan thermocouples are given with temperature in degrees Celsius (centigrade) and Fahrenheit and electromotive force in millivolts as the arguments. The tables are based upon the absolute electrical units and the International Temperature Scale of 1948. They are the latest ersions of all such tables prepared at the National Bureau of Standards.

STORM, H F

Magnetic amplifiers Contributors E. F W Alexanderson and others New York

CIVIL ENGINEERING

GENERAL

ABBETT ROBERT W., editor

American civil engineering practice. In three volumes. Prepared by a staff of specialists under the editorship of Robert W Abbett. Volumes I–II. New York John Wiley & Sons, Inc., 1956. 2 v 22 cm. $15.00 per vol. 5438

Contents: Volume II: Metropolitan and community planning, by T. T. McCrosky and Y. de Panchete. Surveying, by G. D. Whitmore and others. Traffic engineering, by T. J. Fratar and T. M. Matson. Highway engineering, by W. J. Cox and A. W. Bushell. Airport engineering, by P. Mason. Railroad engineering, by W. W. Hay. [illegible] and site construction, by W. M. Aagaard and C. S. Proctor. Foundations, by W. M. Aagaard and C. S. Proctor. Earthwork and dredging, by W. M. Aagaard and C. S. Proctor. Tunnels, by O. Singstad and D. Kalin. Mathematical tables. Index. Volume III: Hydraulics and pumping, by J. G. Woodburn. Hydrology, by W. W. Horner. Dams, by W. P. Creager and B. O. McCoy. River engineering, by G. R. Marsden and J. H. Stratton. Hydroelectric power, by W. P. Creager and E. R. Strouse. Irrigation and land drainage, by D. P. Barnes. Public water supply, by R. Hazen. Sewerage and sewage disposal, by Metcalf and Eddy. Refuse collection and disposal, by R. Eliassen. Harbor engineering, by R. W. Abbett and others.

Note: Planned as a successor to the long-standard American civil engineers' handbook, edited by M. Merriman, this new work is a full-scale reference book on contemporary civil engineering as it is practiced in the U.S.A. A modern feature is that it covers planning as well as design and construction. It is composed, as the above contents show, of sections written by recognized authorities. In some of the sections, the style is concise and depends on many tabular and graphical representations of data. On the other hand, some sections, particularly those on such topics as community planning, are written more fully and are suited to straightforward reading. Selected literature references are included in some sections. Each volume has its own detailed subject index. The third volume containing articles on such topics as concrete structures, retaining walls, bridges, and miscellaneous structures such as towers, masts, bunkers, chimneys and tanks was published in 1957 $15.00.

HENNES, ROBERT G., AND MARTIN I. EKSE

Fundamentals of transportation engineering. New York McGraw Hill Book Company Inc., 1955 520 p. illus. 24 cm. (McGraw-Hill series in civil engineering: Harmer E. Davis, consulting editor) $8.50 5439

Contents (abridged): Part 1. Roads and pavements: Foundation soils. Grading the roadbed. Stabilized roads. Bituminous materials—properties and basic uses. High-type bituminous pavements. Portland cement concrete pavements. Drainage. General maintenance of roads and streets. Part 2, Airport engineering: Design standards. Runways and space. Layout. Grading. Drainage. Pavements. Marking and lighting. Part 3, Railroad engineering: Historical development and present trends. The permanent way. Steam locomotives. Diesel-electric and electric locomotives. Train resistance. Speed-time-distance calculations, horsepower output, and fuel consumption. Elements of subgrades. Part 4, River and coastal engineering: River hydraulics. Channel regulation. Locks and dams. Ports and harbors. Wind, waves, tides, currents. Coastal structures. Part 5, Pipeline transportation. Part 6, Belt conveyors. Index.

Note: The fields of transportation engineering treated in this [illegible] are indicated in the part-titles which are listed above. Engineering is emphasized. When economic and other related aspects are included at all, the discussions are brief. Special attention has been paid to the terminology of the various fields and terms, such as "[illegible]," "[illegible]," "[illegible]," and "[illegible]," and are [illegible] when first introduced. There are many graphs and tables of reference data. Primarily a text for advanced undergraduate students of civil engineering, the book has some appeal for graduate engineers because of its inclusive scope.

KIRBY RICHARD SHELTON AND PHILIP GUSTAVE LAURSON

The early years of modern civil engineering New Haven Yale University Press, 1932 324 p. illus. 24 cm. $6 00 5440

Contents: Preface. Illustrations. Introduction. Surveying. Canals. Roads and pavements. Railroads. Bridges. Tunnels and subways. Waterworks and water power. Sewers. River and harbor improvement. Materials. Biographical outlines. Bibliography. Index.

Note: A history of the profession in terms of its accomplishments and leading engineers. The period covered is from the seventeenth to the late nineteenth century, and the emphasis is placed on modern beginnings rather than on a complete story of development. The book is addressed to those who have some background of civil engineering interest or knowledge.

NICHOLS HERBERT L. JR.

Moving the earth the workbook of excavation. Illustrations by Helen Schwagerman. Greenwich, Conn. North Castle Books distributed by D Van Nostrand Company Inc., Princeton, N J., 1955 1,280 p. illus. 25 cm. $15 00 5441

Contents: Part 1, The work. Land clearing. Levels and location. Soil and sand. Cellars. Ditching and dewatering. Ponds. Landscaping, and agricultural grading. Roads. Rock blasting and [illegible]. [illegible] operation. Making and losing money. Part 2, The machines. Basic information. Revolving shovels. Conveyor machinery. Tractors and bulldozers. Tractor loaders. Scrapers. Dump trucks and wagons. Grading and compacting machinery. Compressors and drills. Miscellaneous machinery. Appendix. Glossary. Index.

Note: Techniques of excavation, land-moving and dewatering of construction sites, and the machines with which the operations are carried out, are both covered in this cyclopedic work. The techniques are described explicitly from the viewpoint of men engaged in the construction industry. So thorough is this section of the book that it even includes a discussion of first-aid measures to apply when workers are stung by insects. In the part on machines, as much attention is given to the principles and mechanical details of specific machines as to machine types and uses. Both parts are very fully illustrated with reproductions of drawings and photographs illustrating typical machines and showing how they are used most effectively. The glossary is 21 pages long.

RICHARDSON HAROLD WARD AND ROBERT S MAYO

Practical tunnel driving. New York McGraw Hill Book Company Inc. 1941 436 p. illus. 23 cm. $7 75 5442

Contents: History of tunneling. Engineering and design. Tunnel surveying. Safety in tunneling. Shaft sinking. Mucking. Tunnel hauling. Hoists and headframes. Ventilation and dust control. Pumping and water handling. Plant and utilities. Soft-ground tunneling with timber. Soft-ground tunneling with liner plates. Shield-driven tunnels. The shield. The plenum process. Air locks. Tunneling in rock. Drills and drilling. Explosives. General support in rock tunnels. Concrete lining. Tunnels in exceptional ground. Pipe jacking.

Note: A practical text and reference treatment for engineers and contractors, covering all phases of tunneling and all kinds and classes of tunnels, large or small, constructed in soft ground

matics. Practically every concept is illustrated in a diagram or cartoon-type drawing in addition to being described. Although designed for use in organized classes under the guidance of trained instructors, the work is also suitable for home study by readers who desire a practical rather than a theoretical knowledge of automatic control. It was developed originally for use in specialty schools of the United States Navy

WADE, WARREN F, AND EMORY N KEMLER

Automatic control bibliography Spring Park, Minn Summary Reports, 1955 331 p 23 cm $15 00 5436

Contents: Part I, Bibliography of American and British articles. Part II, Index of magazine articles Automation. Chemical industry—miscellaneous. Control panels. Control valves. Courses. Economics. Electric-electronic controls. Engineering. Food processing equipment. Furnaces and kilns. Heating and ventilating. History and trends. Hydraulic controls. Instrument department—its origin and function. Internal combustion engines. Machine tools and manufacturing processes. Maintenance. Mechanical controls. Oil and gas production applications. Paper industry Pipeline applications. Pneumatic controls. Power plant. Refinery and petrochemicals. Standardization. Theory of control. Water treatment and industrial waste disposal. Part III Book bibliography List of periodicals on automatic controls. List of abbreviations of magazines.

Note. Periodical articles and books written in English and bearing on automatic control are listed in this useful bibliography The first and main part is arranged by author and the usual bibliographical information is given, that is, author's name, title of article, title of journal, volume, pagination, month and year of publication. In addition, there is in many instances a short descriptive note. Following the author list, there is a listing of anonymous articles arranged by title of periodical in which they appeared. There are 1 423 entries in the two lists. A classified subject index (the headings are listed above) follows. Finally there are lists of British and American books and English-language periodicals. The span of time covered is approximately 1900-1954 with, of course, most of the references being publications of the last two decades.

WOODBURY, DAVID O

Let ERMA do it, the full story of automation. New York Harcourt, Brace and Company, 1956 305 p illus. 21 cm. $5 00 5437

Note. ERMA in the title of this book designates a specific Electronic Recording Machine—Accounting, which was developed for and is now in use in a branch of the Bank of America in San Jose, California. ERMA with a little human assistance does the record keeping and accounting for many thousands of individual bank accounts. However the book is more than a history of this one machine. It is a popular account of automation in general. The elementary principles of automatic control and machines, not only accounting machines but also automatic production lines in factories, electronic computers, etc., are explained in the common language and there is, in addition considerable discussion of the social implications of automation and the need for it in our contemporary civilization. It is written in a style that is both lively and vivid.

URQUHART, LEONARD CHURCH editor

Civil engineering handbook. Third edition. New York McGraw Hill Book Company Inc., 1950. 1,002 p. illus. 24 cm. $11.00. 5449

Contents: Surveying, by R. E. Davis. Railway, highway and air port engineering, by J. R. Babcock, 3rd, and A. J. [illegible]. Mechanics of materials, by J. R. [illegible]. Hydraulics, by H. W. King and E. F. Brater. Stresses in framed structures, by L. C. Urquhart. Steel design, by C. T. [illegible]. Cement and concrete, by H. J. Gilkey. Soil mechanics and foundations, by A. E. Cummings. Sewerage and sewage disposal, by R. G. Tyler. Water supply and purification, by R. E. [illegible]. Index.

Note: As in previous editions, this book is primarily a basic reference tool for engineering students and practicing engineers. In spite of its handbook nature, many of the sections are fairly complete expositions of the topics to which they are devoted. Although the greater part of the text has been carried over from the previous edition, there has been extensive revision. The additional 128 pages are largely accounted for by new sections on photogrammetric surveying, airport engineering, and hydraulic models; but the chapter on cement and concrete has been expanded, and mechanics and soil [illegible] are treated at greater length, and numerous small changes occur throughout the book. The bibliographies have been revised.

SURVEYING

BOUCHARD HARRY

Surveying. Third edition. Scranton International Textbook Company 1947 647 p. illus. 20 cm. $6.75 5450

Contents: Introduction. Measurement of horizontal distances. Measurement of vertical distances. The measurement of angles. Field operations with the transit. The direction of lines. Traverse surveys. Curvilinear surveys. Triangulation. Topographic surveys. Hydrographic surveys. Earthwork. Special surveys. United States public land surveys. Municipal surveys. Latitude, longitude, azimuth, and time. The adjustment of instruments. Errors. Constructing and finishing maps. State coordinate systems. Tables. Index.

Note: Detailed treatment of many topics in this standard textbook for student engineers makes it suitable as a reference work for practicing engineers and surveyors as well. Since the publication of the previous edition (1940) about 30 states have legalized the state system of plane coordinates established by the U. S. Coast and Geodetic Survey. In this edition, a new chapter has been included to explain these state systems and the advantages of tying land surveys to their control points. Also, new material on the use of aerial photographs in mapping has been added to the chapter on topographic surveys.

BREED CHARLES B

Surveying. New York John Wiley & Sons Inc., 1942 495 p. illus. 18 cm. 5451

Contents: Surveys and their purposes; sources of surveying information. Measurement of distances. Measurement of direction: the magnetic compass. Measurement of angles; use of the transit. The engineer's level and its use. Traverse and land surveys. Calculation of closed traverses and land areas. The United States system of surveying the public lands. Contours. Stadia surveying with transit and plane table. Aerial surveying. Lines and grades. Cross-sections; volumes. Miscellaneous surveying problems. Plotting and finishing maps. Tables. Index.

Note: A succinct treatment of the fundamentals of modern surveying practice. A full discussion is given of the principles and of the use of surveying instruments. Numerous field exercises and problems in this part of the book provide a basic knowledge of surveying technique. Emphasis is placed on surveying for construction. One survey is carried on from the beginning to the end of the book and is used throughout to illustrate the principles under discussion. The latter part of the book comprises a set of tables, sufficiently extended to meet the needs of almost all surveying problems. A new edition was published in 1957 497 p., $5.50.

BREED CHARLES B AND GEORGE L. HOSMER

The principles and practice of surveying. Volume I, Elementary surveying. Eighth edition. New York John Wiley & Sons, Inc., 1945 717 p. illus. 19 cm. $6.00 5452

Contents. Part I, Use, adjustment, and care of instruments: General definitions—measurement of lines—adjustment of errors. Measurement of direction. Measurement of angles. Measurement of differences of elevation. Part II, Surveying methods. Land surveying. Traverse lines—location of buildings, miscellaneous surveying problems. The stadia method—the plane-table method. Observations for meridian and latitude. Leveling. City surveying—lines and grades for construction—survey of city lots, buildings and party walls. [illegible] topographical surveying methods. Mine surveying. Part III, Computations: General principles—miscellaneous problems—earthwork computations. Calculations relating to traverses. Part IV Plotting: Drafting instruments and material—process prints. Methods of plotting. Finishing and filing drawings. Tables. Appendices.

—— Volume II Higher surveying. Seventh edition. New York John Wiley & Sons Inc., 1953 675 p. illus. 19 cm. $7.00 5453

Contents: Part I, Control of the survey: Control—triangulation—traverse. Astronomical observations. Precise, trigonometric, and barometric leveling. Part II, Filling in topographic details: The transit and stadia method. The plane-table method. The relation of geology to topography. Part III, Photogrammetric surveying: Ground photogrammetry. Aerial photogrammetry. Stereophotogrammetry. Part IV Hydrographic surveying and stream gaging: Hydrographic surveying. Measurement of the flow of water in open channels. Part [illegible] Constructing and finishing maps: Map projections. Plotting and finishing topographic and hydrographic maps. Tables. Appendices.

Note: A standard work which has been used in its various editions as a text for students and a reference work for practicing surveyors for about 50 years. A current set consists of the editions listed above. Revisions in the eighth edition of Volume I included rewriting of the note on public land surveys to bring it into accord with current practice in the United States of America. Revisions in the seventh edition of Volume II include rather extensive changes in the chapter on astronomical observations, rewriting of the section on barometric leveling in chapter three, and a complete revision of the third part on photogrammetric surveying.

BRINKER RUSSELL C., AND WARREN C TAYLOR

Elementary surveying Third edition Scranton, Pa. International Textbook Company 1955 550 p. illus. 22 cm. $5 50 5454

Contents. Part [illegible] Introduction. Theory of measurements and errors. Surveying field notes. Linear measurements. Leveling. Angles, bearings, and azimuths. The compass. The transit. Traversing. Traverse computations. Area. Stadia. Topographic surveys. Mapping. The plane table. Adjustments of instruments. Part II: Determination of meridian. Photogrammetry. Boundary surveys. Surveys of the public lands. Construction surveys. Circular curves. Parabolic curves. Volumes. Industrial applications. Appendices. References. Index.

Note: An introductory though comprehensive textbook. It is used in the instruction of college students preparing for such fields as engineering, geology, and forestry. In addition to covering standard techniques and applications of surveying, it contains discussions of aerial photogrammetry, public land surveying, and the use of surveying equipment in the setting up of jigs for certain manufacturing processes. A first edition was published in 1930 with Professor Taylor as the only author. The book has been much reorganized, revised and extended in this third edition.

DAVIS RAYMOND E.

Elementary plane surveying. Third edition. New York McGraw Hill Book Company Inc., 1955 507 p. illus. 21 cm. $6.00. 5455

Contents: Field and office work. Errors. Measurement of distance. Measurement of difference in elevation. Differential leveling. Profile leveling; cross sections; grades. Plotting profiles and cross sections; volumes of earthwork. Measurements of angles and directions. The engineer's transit. Transit-tape surveys. Stadia surveying. Triangulation of ordinary precision. The plane table. Map drafting. Map plotting. Calculation of areas of land. Field astronomy—latitude and azimuth. Land surveying. Topographic maps.

or hard. Carries through all steps from basic fundamentals to completion of the project, including discussion not only of location, investigation and planning of the project, design, construction and economics, but also of such practical details as track layout, size of cars, timbering, explosives, etc.

SCHEFFAUER, FREDERICK C, editor

The hopper dredge, its history, development, and operation Prepared by the office of the Chief of Engineers, U S Army, under the direction of the Hopper Dredge Board Frederick C Scheffauer, editor in-chief Washington, D C Government Printing Office, 1954 399 p illus 28 cm $4 00 5443

Contents Introductory description and fundamentals. Operation. Hull and superstructure. Machinery and controls. Dredge pumps. Dredge pump suction assemblages. Dredge pump discharge assemblages. Hopper and overflow systems. Drags. Gas removal systems. Economic loading. Unusual dredging accomplishments. Appendix. Typical specifications for rubber-covered ball-joints. Bibliography Historical summary of design functions and biographies. Dredging report forms. Index to figures and tables. Subject index.

Note The Corps of Engineers of the United States Army has for about century been building and operating seagoing hopper dredges for the improvement of navigable waterways under its jurisdiction. During this period, the hopper dredge has increased in length from about 150 feet to 525 feet and has changed from a crude device to an efficient machine designed for a special purpose and equipped with the latest aids to navigation and safety The purpose of this volume is to trace the development of those features peculiar to this type of vessel to describe in some detail, with appropriate technical illustrations, improvements in its design, construction, and operation and also to point out some of the mistakes which have been made. Much of the subject matter was drawn from personal observations of the various authors, and the remainder from records of the Corps of Engineers.

SEELYE ELWYN E

Data book for civil engineers Design. Second edition New York John Wiley & Sons, Inc, 1951 725 p illus 30 cm. $16 75 5444

Contents Structural—general—concrete—rigid frames—steel—aluminum—welding—wood—plywood—foundations—beam formulas. Earthwork. Roads. Railroads. Airports. Bridges. Dams. Corrosion of metals. Docks and piers. Transmission towers. Drainage. Drainage and sewerage. Sewage treatment. Industrial wastes. Waste disposal. Water supply Water purification. Water distribution. Grandstands. Athletic fields. Outdoor swimming pools. General. Index.

—— Specifications and costs. Second edition New York John Wiley & Sons Inc. 1951 505 p. illus 30 cm $16 75 5445

Contents Contract documents. Site investigation. Structural specifications. Industrial buildings. Airports, roads, and railroads. Bridges. Docks. Dams. Drainage, sewers, sewage treatment, and water supply Swimming pool. Athletic fields. Costs. Glossary Specifications index. Costs index. Glossary index.

—— Field practice Second edition. New York John Wiley & Sons Inc 1954 394 p illus 21 cm $7 50 5446

Contents Part I, Inspection Construction equipment Erection methods. Material handling. Safety provisions. Concrete. Masonry Structural steel Welding. Metals. Bridges. Painting. Foundations. Piles. Rope and cable—strengths. Varieties of knots. Wood and timber construction. Soils. Grading. Bituminous paving. Sewers, drains, water gas, etc.—pollution control works. Precast concrete pipe manufacture. Sanitary and drainage construction. Miscellaneous. Part II, Surveying Topographic survey Construction stakeouts. Circular curves. Transition curves. Vertical curves. Railroad turnouts and crossovers. Earthwork computations. Leveling. Transit problems. Allowable errors. Determination of true north Instruments and their adjustments. Taping. Mapping. General tables and information. Index.

Note: A comprehensive, practical reference work. The author has practiced engineering in the United States of America for more than three decades, and the books are based on his experience and that of his firm. He has included in them the kind of information that he knows is often needed in designing and supervising construction The material consists mainly of tabulated data, structural design details, model specifications, check lists, and concise descriptions of procedures. The first two volumes are for office use, but the third volume is designed for carrying in the field when necessary The first editions of the three volumes were published in 1945–47 Revisions and additions have been made to each of the volumes as new editions were published. A third edition of the volume on specifications and costs was published in 1957 $20.00.

TRAUTWINE, JOHN CRESSON, AND JOHN C TRAUTWINE, JR.

The civil engineer's reference-book (formerly "pocket book") Edited by John C. Trautwine 3d Twenty first edition. Ithaca Cornell University Press, 1937 1,514 p. illus. 17 cm. $7 00 5447

Contents (abridged) Mathematics: Arithmetic. Geometry mensuration, and trigonometry—Lines. Angles. Surfaces. Solids. Specific gravity Weights and measures. Surveying. Natural phenomena. Sound. Heat. Air. Atmosphere. Wind. Rain and snow Water. Evaporation. Leakage. Mechanics. Strength of materials: General principles. Transverse strength. Strength of columns. Shearing and torsional strength. Hydrostatics. Hydraulics. Constructions, etc.: Hoisting, conveying and excavating machinery Dredging. Foundations. Stonework. Retaining walls. Stone bridges. Timber dams. Water supply Test and well boring. Rock drills. Traction, animal power. Trusses. Stresses in truss members. Bridge details and construction. Digests of specifications for bridges and buildings, steel railroad and highway bridges, combination railroad bridges. Suspension bridges. Rivets and riveting. Railroads. Track. Turnouts and crossings. Curves. Signaling. Yards and stations. Earthwork. Tunnels. Trestles. Rolling stock. Train resistance. Train dynamics. Operation cost. Construction cost. Materials Timber. Iron and steel. Cement mortar Concrete. Reinforced concrete. Price list. Bibliography Index.

Note A reference handbook for civil engineers, presenting in concise form review of theory in mathematics, physics, mechanics, strength of materials, railroad construction, and related subjects, together with numerous tables of data, graphs, and other statistics. The section on railroads is rather extensive and covers their engineering and construction as well as some aspects of operation.

UNITED STATES DEPARTMENTS OF THE ARMY AND THE AIR FORCE

Special surveys Washington, D C. Government Printing Office, 1953 301 p. illus. 23 cm (United States. Department of the Army Technical manual TM 5–235) $1 00 5448

Contents I, Introduction General. Responsibilities. II, Underground surveying: Operations. Underground surveying equipment. Angular measurements. Underground leveling. Underground topography Shaft-plumbing and transfer of azimuth. Underground traverses. Typical problems and notes. Expedient measures. Computations. Maps and models of underground passages. III, Survey support of geology and pedology Survey support for geologic mapping. Survey support for pedological mapping. IV Hydrographic surveys. Operations. Tidal observations. Streamflow and stream-gaging stations. Stream-gaging equipment. Measurement of streamflow Special hydrographic projects. Subsequent surveys. Equipment for sounding operations. Methods of taking and locating soundings. Finishing the subsequent survey Land surveying. Operations. Surveys of private lands. Surveys of public lands. Field operations in surveys of public lands. Appendix. References. Glossary Index.

Note. For purposes of this manual the term "special surveys" designates geological, underground, hydrological and land surveys undertaken to provide specialized data for military engineering projects and other engineering work for which the Army is responsible. Operational procedures, instruments and equipment peculiar to or generally used in such surveys are covered. Knowledge of basic surveying principles, techniques and instruments on the part of readers has been assumed. Since special surveys are frequently related to plane, route, construction, and geodetic-control surveys, the appendix gives list of related manuals, regulations, and survey texts.

URQUHART LEONARD CHURCH editor

Civil engineering handbook. Third edition. New York. McGraw Hill Book Company Inc., 1950. 1,002 p. illus. 24 cm. $11.00. 5449

Contents: Surveying, by R. E. Davis. Railway, highway and airport engineering, by J. B. Babcock, 3rd, and A. J. Bone. Mechanics of materials, by J. S. Kemmerer. Hydraulics, by H. W. King and E. F. Brater. Stresses in framed structures, by L. C. Urquhart. Steel design, by C. T. Bishop. Cement and concrete, by H. J. Gilkey. Soil mechanics and foundations, by A. E. Cummings. Sewerage and sewage disposal, by R. G. Tyler. Water supply and purification, by R. E. Babbitt. Index.

Note: As in previous editions, this book is primarily a basic reference tool for upperclass students and practicing engineers. In spite of its handbook nature, many of the sections are fairly complete expositions of the topics to which they are devoted. Although the greater part of the text has been carried over from the previous edition, there has been extensive revision. The additional 118 pages are largely accounted for by new sections on photogrammetric surveying, airport engineering, and hydraulic models, but the chapter on cement and concrete has been expanded, soil mechanics and soil tests are treated at greater length, and numerous small changes occur throughout the book. The bibliographies have been revised.

SURVEYING

BOUCHARD HARRY

Surveying. Third edition. Scranton International Textbook Company 1947 647 p. illus. 20 cm. $6.75 5450

Contents: Introduction. Measurement of horizontal distances. Measurement of vertical distances. The measurement of angles. Field operations with the transit. The direction of a line. Traverse surveys. Coordinate surveys. Triangulation. Topographic surveys. Hydrographic surveys. Earthwork. Special surveys. United States public land surveys. Municipal surveys. Latitude, longitude, azimuth, and time. The adjustment of instruments. Errors. Constructing and finishing maps. State coordinate systems. Tables. Index.

Note: Detailed treatment of many topics in this standard textbook for student engineers makes it suitable as a reference work for practicing engineers and surveyors as well. Since the publication of the previous edition (1940) about 20 states have legalized the state system of plane coordinates established by the U. S. Coast and Geodetic Survey. In this edition, a new chapter has been included to explain these state systems and the advantages of tying land surveys to their control points. Also, new material on the use of aerial photographs in mapping has been added to the chapter on topographic surveys.

BREED, CHARLES B

Surveying. New York John Wiley & Sons, Inc., 1942 495 p. illus. 18 cm. 5451

Contents: Surveys and their purposes, nature of surveying information. Measurement of distances. Measurement of direction, the magnetic compass. Measurement of angles: use of the transit. The engineer's level and its use. Traverse and land surveys. Calculation of closed traverses and land areas. The United States system of surveying the public lands. Contours. Stadia surveying with transit and plane table. Aerial surveying. Lines and grades. Cross-sectional volumes. Miscellaneous surveying problems. Plotting and finishing maps. Tables. Index.

Note: A succinct treatment of the fundamentals of modern surveying practice. A full discussion is given of the principles and of the use of surveying instruments. Numerous field exercises and problems in this part of the book provide a basic knowledge of surveying techniques. Emphasis is placed on surveying for construction. One survey is carried on from the beginning to the end of the book and is used throughout to illustrate the principles under discussion. The latter part of the book comprises a set of tables, sufficiently extended to meet the needs of almost all surveying problems. A new edition was published in 1957 495 p. $5.50.

BREED CHARLES B AND GEORGE L. HOSMER

The principles and practice of surveying. Volume I, Elementary surveying. Eighth edition. New York John Wiley & Sons, Inc. 1945 717 p. illus. 19 cm. $6.00 5452

Contents: Part I, Use, adjustment, and care of instruments: General definitions—measurement of lines—adjustment of errors. Measurement of direction. Measurement of angles. Measurement of differences of elevation. Part II, Surveying methods: Land surveying. Traverse lines—location of buildings, miscellaneous surveying problems. The stadia method—the plane-table method. Observations for meridian and latitude. Leveling. City surveying—lines and grades for construction—survey of city lots, buildings and party walls. Part IV, Plotting: Drafting instruments and materials—process prints. Methods of plotting. Finishing and filing drawings. Tables. Appendices.

—— Volume II Higher surveying Seventh edition. New York John Wiley & Sons, Inc., 1953 675 p. illus. 19 cm. $7.00. 5453

Contents: Part I, Control of the survey: Control—triangulation—traverse. Astronomical observations. Precise, trigonometric, and barometric leveling. Part II, Filling in topographic details: The transit and stadia method. The plane-table method. The relation of geology to topography. Part III, Photogrammetric surveying: Ground photogrammetry. Aerial photogrammetry. Stereophotogrammetry. Part IV, Hydrographic surveying and stream gaging: Hydrographic surveying. Measurement of the flow of water in open channels. Part V, Constructing and finishing maps: Map projections. Plotting and finishing topographic and hydrographic maps. Tables. Appendices.

Note: A standard work which has been used in its various editions as a text for students and a reference work for practicing surveyors for about 50 years. A current set consists of the editions listed above. Revisions in the eighth edition of Volume I included rewriting of the notes on public land surveys to bring it into accord with current practice in the United States of America. Revisions in the seventh edition of Volume II include rather extensive changes in the chapter on astronomical observations, rewriting of the section on barometric leveling in chapter three, and complete revision of the third part on photogrammetric surveying.

BRINKER RUSSELL C AND WARREN C TAYLOR

Elementary surveying Third edition Scranton Pa. International Textbook Company 1955 550 p. illus. 22 cm. $5.50 5454

Contents: Part I, Introduction. Theory of measurements and errors. Surveying field notes. Linear measurements. Leveling. Angles, bearings, and azimuths. The compass. The transit. Traversing. Traverse computations. Area. Stadia. Topographic surveys. Mapping. The plane table. Adjustments of instruments. Part II, Determination of meridian. Photogrammetry. Boundary surveys. Surveys of the public lands. Construction surveys. Circular curves. Parabolic curves. Volumes. Industrial applications. Appendixes. References. Index.

Note: An introductory though comprehensive textbook. It is used in the instruction of college students preparing for such fields as engineering, geology and forestry. In addition to covering standard techniques and applications of surveying, it contains discussions of aerial photogrammetry, public land surveying, and the use of surveying equipment in the setting up of jigs for certain manufacturing processes. A first edition was published in 1930 with Professor Taylor as the only author. The book has been much reorganized, revised and extended in this third edition.

DAVIS RAYMOND E.

Elementary plane surveying. Third edition. New York McGraw Hill Book Company Inc., 1955 507 p. illus. 21 cm. $6.00. 5455

Contents: Field and office work. Errors. Measurement of distance. Measurement of difference in elevation. Differential leveling. Profile leveling; cross sections; grades. Plotting profiles and cross sections; volumes of earthwork. Measurements of angles and directions. The engineer's transit. Transit-tape surveys. Stadia surveying. Triangulation of ordinary precision. The plane table. Map drafting. Map plotting. Calculation of areas of land. Field astronomy—latitude and azimuth. Land surveying. Topographic maps.

Topographic surveying. Route surveying. Construction surveying. Photogrammetric surveying. References. General tables. Index.

Note. A combined text and field manual of the theory and practice of surveying which is designed primarily for the instruction of college students majoring in fields of engineering other than civil engineering. As the chapter titles show it covers a wide range of topics. However many of the topics are covered in a descriptive manner with attention only to elementary aspects. The first edition was published in 1934 and the second edition in 1941. In preparing this third edition a number of sections were revised and was added. Some illustrations are new and others have been redrawn.

DAVIS, RAYMOND E, AND JOE WALLACE KELLY

Short course in surveying New York Mc Graw Hill Book Co, Inc., 1942 330 p illus. 19 cm. $5 00 5456

Contents Preface. Tables. Field and office problems. Field and office work errors. Measurement of distance. Measurement of difference in elevation. Differential and profile leveling. Measurement of angles and directions. The engineer's transit. Transit-tape surveys. Stadia surveying. Map drafting. Map plotting. Calculation of areas of land. Topographic maps. The plane table. Topographic surveying. Route surveying. Land surveying. Determination of azimuth. References. Trigonometric and miscellaneous surveying tables. Index.

Note. This book presents the fundamental principles and practice of elementary plane surveying for the rapid training of rodmen, chainmen, instrumentmen, and draftsmen. It is a condensation of more advanced textbooks widely used in engineering colleges, only those subjects being presented which are intended to lead to a reasonable proficiency in the shortest possible time.

DAVIS, RAYMOND E, AND FRANCIS S FOOTE

Surveying, theory and practice Fourth edition. New York McGraw Hill Book Company, Inc., 1953 1 021 p illus. 21 cm $8 50 5457

Contents Fundamental concepts. Essential features of principal surveying instruments. Field work. Computations. Errors. Map drafting. Measurement of distance. Measurement of difference in elevation. Differential leveling. Profile leveling, cross-sections, grades. Plotting profiles and cross-sections, volumes of earthwork. Measurement of angles and directions. The engineer's transit. Transit-tape surveys. Stadia surveying. Triangulation. The plane table. Map plotting. Calculation of areas of land. Principles of field astronomy. Azimuth, latitude, longitude, and time. Land surveying, rural and urban. United States public-land surveys. Topographic maps. Topographic surveying. Route surveying. Root curves. Construction surveys. Mine surveying. Hydrographic surveying and flow measurement. Photogrammetric surveying. Map projections. General tables. Index.

Note. A more comprehensive and advanced text than the senior author's *Elementary plane surveying* described above. It includes specialties such as mine surveying which are not covered in the shorter book, and in addition, treats more thoroughly topics that are common to both books. It is used as textbook in courses offered to students with special interests in surveying and as reference book. The first edition was published in 1928 and the third edition in 1940. Much of this fourth edition is identical with the third edition nevertheless, some important changes have been made in both text and illustrations.

GOSSETT, F R

Manual of geodetic triangulation Washington D C Government Printing Office 1950 344 p illus 25 cm. (United States. Coast and Geodetic Survey Special publication no 247) $2 00 5458

Contents. Introduction. Reconnaissance. Triangulation. Base measurement. Azimuths. Special surveys. Appendix Specifications for horizontal and vertical control. Strength of figure. Constants and formulas. Lists of instruments and equipment. Lists of books and forms. Standard list of common names of objects used as landmarks. Special applications of vertical-angle measurements. Miscellaneous tables. Index.

Note. The material in this manual is the product of accumulated experience in the field and in the office of numerous members of the U S. Coast and Geodetic Survey for many years. The manual is compilation of currently approved methods for triangulation surveys of the Coast and Geodetic Survey furnishing specifications and instructions for first second- and third-order triangulation by field parties of the Survey

HICKERSON, THOMAS F

Route location and surveying. Formerly published under the title of *Highway surveying and planning* Third edition New York McGraw Hill Book Company, Inc., 1953 543 p illus. 19 cm. $6 50 5459

Contents Transportation systems. Route surveys. Circular curves. Parabolic curves. Transition spirals. Curve superelevation. Widening highway curves. Sight distance on highways. Earthwork. Drainage surveys and facilities. Construction procedure. String-lining railroad curves. Railroad turnouts and crossings. Miscellaneous. Appendix. List of tables. Tables. Explanation of tables. Index.

Note. The second edition of this manual for students and practicing engineers was published in 1936. In the third edition the title has been changed to indicate the broadening of the book's scope to include material on railways, canals, pipe lines, and airports. Basic principles and mathematical methods are stressed, but the inclusion of large collection of tables also enables the volume to be used as field manual.

HOSKINSON, ALBERT J, AND J A. DUERKSEN

Manual of geodetic astronomy determination of longitude, latitude, and azimuth. Washington, D C Government Printing Office, 1947 205 p illus 26 cm (United States. Coast and Geodetic Survey Special publication no 237) $1.25 5460

Contents. Introduction. Part I, Determination of longitude: Longitude determination with the Bamberg transit. Instruments. Astronomical test. Equatorial value of longitude micrometer. Level sion. Mean width of contact strips. Lag in the radio filter. Computation, station site and instrumental setup. Adjustments of the instruments. Longitude determination. Part II, Determination of latitude by the Horrebow-Talcott method. Introduction. General instructions for latitude work. The Bamberg broken-telescope transit. Observing list for latitude. Directions for observing. Latitude computation. Part III, Determination of the astronomic azimuth of direction Definitions. Specifications for Laplace azimuth. Instruments Instrument support and protection. Determination of azimuth. Direction method. Micrometer method, azimuth determinations in high latitudes with the Bamberg broken-telescope transit. Appendix Latest procedure in longitude determination. Reduction of mean to apparent place. Correction to azimuth for the elevation of the mark. Correction for the displacement of the pole. Rejection of doubtful observations. Probable errors of adjusted values. Astronomical refraction. Tables. Explanation of tables. Index.

Note The material in this manual is the product of the accumulated experience in office and field of the members of the U. S. Coast and Geodetic Survey from its earliest days to the present. Its purpose is to set forth the methods currently used by the Survey in its astronomical work in the field and to describe in some detail the office methods used in computing and processing the field records. It supplants previous manual, Special publication no. 14 *Determination of time, longitude, latitude and azimuth.*

HOSMER, GEORGE LEONARD

Practical astronomy a textbook for engineering schools and a manual of field methods Fourth edition revised and rewritten by James M Robbins New York John Wiley & Sons Inc., 1948 355 p. illus 22 cm. $6.25 5461

Contents. Part I, Fundamental principles of practical astronomy: The celestial sphere—real and apparent motions. Definitions—points and circles of reference. Systems of coordinates on the sphere. Relation between coordinates. Measurement of time. Ephemerides—star

catalogues—interpolation. The earth's figure—corrections to observed altitudes. Description of instruments. The constellations—star identification. Part II, Engineering astronomy: Observations for latitude. Observations for time and longitude. Observations for azimuth. Tables. Greek alphabet. Abbreviations used in this book. Symbols used in this book. Appendix: Spherical trigonometry.

Note: An introductory text that is designed for students who will take only a short course in the subject. It outlines the theory and procedures of astronomical observations and calculations, and their practical applications in such fields as surveying, civil engineering, time measurement, and gives descriptions of the major instruments used in such observations. The work has been rather extensively revised in this edition.

IVES, HOWARD CHAPIN

Highway curves. Fourth edition highway surveying, *location, geometric design, and* earthwork, by Philip Kissam. New York John Wiley & Sons, Inc., 1952 197 389 p. illus. 18 cm. $7.50 5462

Contents: Part I, Text: The location procedure. The preliminary survey. The location survey. Simple curves. Compound curves. Reversed curves. Vertical curves. Spirals, superelevation, and widening. Cross sections. Volume computation. Haul and the mass diagram. Ramps for interchanges. Part II, Tables. Curves of even radius. Curves of even degree, arc definition. Searles spiral. Logarithms. Natural trigonometric functions. Functions of numbers. Conversions. Trigonometric formulas. Explanation of tables. Index.

Note: A standard work used both as an engineering college text and field book. It presents the practices followed by the Highway Departments of the state governments and by the national government in laying out highway routes. The third edition appeared in 1941. This is the first edition by Professor Kissam, and it is a thorough revision in which important changes have been made in both the expository text and in the tables.

KIELY, EDMOND R.

Surveying instruments, their history and classroom use. Washington National Council of Teachers of Mathematics, 1947 411 p. illus. 23 cm. (*National Council of Teachers of Mathematics. Nineteenth Yearbook*) $3.00 5463

Contents: Beginnings in Egypt, China, and Babylonia. Developments in Greece and Rome. Contributions of medieval Europe, Islam, and India. Advancements in Europe during the Renaissance. Development of practical geometry in the schools. Applications of geometry trigonometry in simple surveying. Appendix. Bibliography. Index.

Note. Addressed to teachers of high-school mathematics with the purpose of interesting them in simple surveying as part of the program for geometry and trigonometry classes, and of providing them with sufficient exercises to carry out such a program. About two-thirds of the book is devoted to the history of the development of surveying instruments from early times through the seventeenth century. The construction and use in various periods and countries of such devices as leveling and right-angle instruments, the astrolabe, dial constructions, and compasses are descriptively presented and are illustrated by old prints and diagrams. Sample outdoor surveying exercises conclude the book. These are selected to illustrate basic geometrical principles and their solutions requiring the use of instruments are outlined. Since, however, the author believes that proficiency with instruments can be acquired only by practice, few directions are included for their use.

KISSAM, PHILIP

Surveying for civil engineers. New York McGraw Hill Book Company Inc. 1956 716 p. illus. 24 cm. $8.50. 5464

Contents: Part I, Instruments and methods for large surveys. Introduction, errors, and planning a survey. Precise levels and differential leveling. Horizontal measurement. Angular measurement. The compass and the earth's magnetic field. Simple control surveys. Topographic surveys. Planning and estimating from topographic maps. Part II, Operations. Celestial observations. Boundary surveys. The United States public land surveys. Fundamental survey control and the state coordinate systems. City surveys. Mine surveys. Hydrographic surveys and stream gaging. Bridge and tunnel surveys. Part III, Procedures for precise control. Precise level nets. Precise triangulation. Precise traverse nets. Part IV. Aerial mapping. Part Appendix. Probability. Least squares. The theory of state coordinate systems. Tables and charts. Index.

Note. Both a textbook for advanced courses and a practical treatise for professional civil engineers, this work describes the techniques and instruments used in mine surveying, hydrographic surveying, surveying for large construction projects, etc. It is complementary to the author's *Surveying: instruments and methods for surveys of limited extent* (see below) but may be used independently by any engineer or engineering student who has a knowledge of elementary surveying. A good deal of ground is covered, nevertheless, there is much detailed discussion of special points, for instance, of making tape corrections in mine surveys. The importance of precision is a constant theme.

KISSAM PHILIP

Surveying *instruments and methods for* surveys of limited extent Second edition. New York McGraw Hill Book Company Inc. 1956 482 p. illus. 23 cm $5 75 5465

Contents: Part I: Surveying and its applications. The surveying method. Horizontal measurement. The transit. Use of the transit. Adjustment of transit. Traverse. The level and bench-mark leveling. Adjustment of level. Leveling procedures. Establishing line and grade for construction. Miscellaneous operations. Topographic surveying. Drawing maps and keeping records. Part Tables. Visual aids. Index.

Note. Less advanced and less specialized than the complementary Surveying for civil engineers, described above, this book is designed to prepare engineers and others to do ordinary surveying. It covers standard instruments, techniques and computations. The first edition was published in 1947. A chapter on optical tooling was added in the second edition, and revisions and additions were made in other chapters.

LEGAULT, ADRIAN R., AND OTHERS

Surveying an introduction to engineering measurements. Englewood Cliffs, N J Prentice-Hall Inc., 1956 430 p illus. 24 cm. (*Prentice-Hall civil engineering and engineering mechanics series* N M. Newmark editor) $6 75 5466

Contents. I, The engineer and surveying: Surveying—its use to the engineer. Surveying as applied to engineering. Computations—some fundamental principles. II, Measurements: Determining distance. Determining direction. The engineer's transit. Measuring elevations. Adjustment of instruments. III, Applications: Control surveys. Subdivisions of public lands. Traverses. Office computations—traverses and simple triangulation. Topographic surveying. Aerial surveying. Construction surveys. Optical tooling. Selected references. Appendix tables. Index.

Note. A broad but simplified view of modern surveying is provided by this textbook. Some information is included on most aspects of the field likely to be of interest to the engineer who is not a specialist in surveying; but some of the chapters, such as the one on optical tooling, are only descriptive outlines of the topics named in their titles. The book is much shorter than typical introductory texts in surveying. However some of the brevity has been achieved by omitting field exercises, although a 100-page section of tables is included. The volume is well illustrated and has an attractive format.

MEYER CARL F

Route surveying Second edition. Scranton Pa. International Textbook Company 1956 312 320 p. illus. 19 cm. $7.50 5467

Contents: Part I, Basic principles: Route location. Simple curves. Compound and reverse curves. Parabolic curves. Spirals. Earthwork. Part II, Practical applications: Special curve problems. Curve problems in highway design. Railroad surveys. Highway surveys. Surveys for other routes. Aerial photography in route surveying. Appendix: Partial theory of the spiral. Part III, Tables. Index.

Note: The main principles and techniques of route surveying are presented in this text and pocket-book. The author is Professor of Civil Engineering in Worcester Polytechnic Institute, and his book is designed primarily for engineering college students. However, it contains a good deal of concise information including tabulated data

which is useful to the engineer in the field. It is well organized and clearly written. The first edition was published in 1949 The chapter on aerial photography in route surveying is new in this second edition, and various revisions, major and minor are apparent in other chapters. The 320-page section of tables now contains 32 tables.

MITCHELL, HUGH CHESTER
Definitions of terms used in geodetic and other surveys. Washington, D C Government Printing Office, 1948 87 p 25 cm. (United States. Coast and Geodetic Survey Special publication no 242) $0 45 5468

Note: A glossary of geodetic and other surveying terms. Work on the publication was begun by the Federal Board of Surveys and Maps in 1933 and concluded, after the abolition of that Board in 1942 in the Division of Geodesy of the U S. Coast and Geodetic Survey For each term, there is a basic definition or description containing the elements essential to a complete and accurate definition or description. For many terms there are also given in separate paragraphs, supplementary statements designed to facilitate the interpretation of the basic definition and to call attention to other uses that may have been made of the terms defined.

MITCHELL, HUGH CHESTER, AND LANSING G SIMMONS
The state coordinate systems (a manual for surveyors) Washington, D C. Government Printing Office, 1945 62 p illus. 25 cm (United States Coast and Geodetic Survey Special publication no 235) $0.50 5469

Contents (abridged) Introduction Establishment of the state coordinate systems. State systems approved by Federal bureaus. Chapter I, The stat coordinate systems Terms and definitions. Geodetic and plane-coordinate positions. Map projections and state grids. Chapter II, Surveys and plane-rectangular coordinates Position of origin and signs of coordinates. Azimuths preferred to bearings. Difference between geodetic and grid azimuths. Convergence of meridians. Plane coordinates and city surveys. State grid zones. Local systems f coordinates. Ground lengths reduced to sea level. Sea-level lengths reduced to grid lengths. Combination factors. reduction to sea level and grid. Characteristics and length reductions. Accuracy of sea-level reduction. Chapter III, The land survey Planning the survey The field work. The office work. Land area. Lost and obliterated corners. Description by coordinates. Bibliography Appendices. Table f the state coordinate systems. Formulas and tables. Index.

Note This manual is designed to aid the surveyor who intends to use a state coordinate system for referencing a land or engineering survey in order that its results may be placed on lasting basis by coordination with surveys in other areas. The state coordinate systems are described, and procedures which their use involves are explained and exemplified by carrying through the computation of farm survey The publication does not attempt to go beyond plane surveying.

NASSAU JASON JOHN
Practical astronomy Second edition New York McGraw Hill Book Company, Inc. 1948 311 p illus. 23 cm (McGraw Hill astronomical series Edward Arthur Fath consulting editor) $6 00 5470

Content (abridged) Part I Fundamental principles and ordinary determinations f time, latitude, longitude, and azimuth. Astronomical systems of coordinates. The astronomical triangle. Time and longitude. The *Nautical almanac*. Con ersion of time. Instruments. Latitude. Azimuth. Part II Precise determination of azimuth, time, longitude, and latitude. Secular and periodic changes, the *American ephemeris and nautical almanac*, star catalogues. Determination of time by the transit instrument. The zenith telescope. Determination of latitude and longitude by equal altitudes. Appendix A. Formulas relating to spherical trigonometry Appendix B. Interpolation. Tables. Forms. Star maps. Index.

Note: An established textbook for college students f civil engineering, which will be of interest also to graduate civil engineers and surveyors who need survey of new instruments and techniques. Compared to the first edition (1932) the present edition has been rearranged and extensively rewritten. One chapter is now devoted to the equilateral-prismatic and the Wills pendulum astrolabes.

PARKER, HARRY, AND JOHN W MACGUIRE
Simplified site engineering for architects and builders. New York John Wiley & Sons, Inc., 1954 250 p illus. 21 cm. $5.50. 5471

Contents. Logarithms. Trigonometry Measuring distances. Measuring angles. Land surveys. Survey computations. Computation of areas. Miscellaneous surveying problems. Circular curves. Leveling. Contours. Uses of contours. Computations for cut and fill. Vertical curves. Drainage and grading. Staking out buildings and roads. Site selection considerations. Check list for site plans. Index.

Note A practical book on the preparation of site plans for buildings, calculating the excavation and grading, planning the drainage systems, etc. Necessarily much of it is devoted to surveying techniques and to calculations in connection with them. The main value of the book lies in the fact that it as ritten for architects and builders without training in surveying. The patient, detailed exposition and the many worked examples make it eminently suitable for self-instruction.

PICKELS, GEORGE WELLINGTON, AND CARROLL CARSON WILEY
Route surveying. Third edition. New York John Wiley & Sons, Inc., 1949 434 p. illus. 18 cm. $5 75 5472

Contents Route surveys. Maps, plans, and profiles. Distance, curvature, and grades. Circular curves. Spirals. String-lining railroad curves. Parabolic curves. Railroad turnouts, connections, and crossings. Earthwork. Appendix. Theory of spiral. Tables. Index.

Note An advanced text and reference book for surveyors and civil engineers. Railroad surveys are treated first, then applications or modifications of the methods to other routes such as highways, pipe lines, and power transmission lines are dealt with. Knowledge of elementary surveying and trigonometry is presupposed. In this edition the chapter on string-lining has been completely rewritten, and other lesser changes have been made throughout to incorporate new material.

RAPPLFYE, HOWARD SNYDER
Manual of leveling computation and adjustment. Washington, D C. Government Printing Office 1948 178 p illus. 25 cm. (United States. Coast and Geodetic Survey Special publication no. 240) $0 75 5473

Contents. Introduction. Notation. Material received from the field. Preliminary processing by the Section of *Field Records*. Preliminary computations. Junction details. Combination computations. Adjustment of leveling. Distribution of corrections. Computation of adjusted elevations. Final check on summary sheets. Tables. Appendix. Resolution of the International Geodetic Association. Resolutions of the International Association of Geodesy Orthometric and dynamic corrections. Development of circuit-reduction method. Application f circuit-reduction method to networks including level circuits having no fixed points. Index.

Note. Geodetic leveling parties f the Coast and Geodetic Survey operating under special instructions issued for each project, carry on the field work of running line of first or second-order levels. The field work is done in accordance with the provisions of the General Instructions for Geodetic Leveling set forth in Special publication no. 239 *Manual of geodetic leveling* As that manual amplifies and explains the General Instructions and is the guide for the geodetic leveling parties in the field, this manual is the guide for the office personnel engaged in processing the data received from the field. It supplants Part II, Office computations, of Special publication no. 140, *Manual of first-order leveling*, by Henry G. A et, first published in 1929 and reprinted with supplement in 1935, 1939 and 1943

RAYNER, WILLIAM HORACE
Advanced surveying Second edition Princeton D Van Nostrand Company, Inc., 1950. 369 p illus. 20 cm $5 00 5474

Contents Errors. Precise leveling. Traverse. Triangulation. *Field astronomy* Topographic surveying. Hydrographic surveying. The

measurement of stream flow. Mine surveying. Photogrammetry. Plane coordinates. History of surveying. Index.

Note: A standard textbook designed for use in undergraduate college courses which have been preceded by a course in elementary surveying. It explains the more refined methods of measurements used in accurate work and also in specialized work. The major change in this edition is expanded treatment of photogrammetry. Also, a true meridian table has been included, and there are other minor revisions. The author is emeritus Professor of Civil Engineering in the University of Illinois.

RAYNER, WILLIAM HORACE, AND MILTON O SCHMIDT

Elementary surveying Third edition Princeton, N J D Van Nostrand Company Inc., 1955 426 p. illus. $5.50. 5475

Contents: Section I, Use and adjustments of instruments: General principles. Measurement of distances. The level. Angles and directions. The transit. Section II, Construction surveys. Leveling. Transit surveys. Computations. Circular and vertical curves. Stadia surveying. Contours and contour construction. The plane table. Topographic surveying. Map drafting. Determination of true meridian. Section III, Land surveying. Tables. Field problems. Index.

Note: This book is one of the standard American textbooks for first college courses in surveying. It describes the various instruments, introduces the reader to the basic techniques of surveying and to the special techniques of land surveying. It is available from the same publisher as a separate book and also in combination with the same author's Advanced surveying, second edition, described above under the title, "Surveying, elementary and advanced," 1957 715 p., $8.50.

RUBEY HARRY AND OTHERS

Engineering surveys elementary and applied, by Harry Rubey George Edward Lommel, and Marion Wesley Todd. Second edition. New York The Macmillan Company 1950. 888 p. illus. 21 cm. $6.75 5476

Contents (abridged): Measurement of distances. Compass surveying. Leveling. The transit. Adjustment and care of instruments. Observations for meridian. Stadia surveying. Topography. Triangulation. Land surveys. Route surveys. Area surveys. City surveys. Office work. Organization of surveys. Introduction to applied engineering surveys. Horizontal control. Engineering astronomy. Vertical control. Topographic details. Photogrammetry. Hydrographic surveying and flow measurements. City planning surveys. Underground surveys. Construction surveys. Tables. Index.

Note: An engineering college textbook which covers the whole field of modern surveying practice including the newer developments such as photogrammetry and allied techniques such as the measurement of stream flow. These uncommon techniques are not covered exhaustively but the discussion is always supplemented by lists of references to related books and articles where more information can be found. The book's inclusiveness and its typographical excellence make it a good one for library use. The second edition was published early in 1914, 916 p., $4.75.

RUBEY HARRY

Route surveys and construction a pocket and reference book with tables for the survey design, and construction of highways, railways, airways, tramways, beltways, canals, flumes, levees, pipe lines, transmission lines, and other route constructions for students, professional engineers, construction engineers, and contractors. Third edition of *Route surveys.* New York The Macmillan Company 1956. 282 p. illus. 18 cm. $6.25 5477

Contents: Introduction. The reconnaissance. The preliminary location. Simple circular curves. Compound and reverse curves. Solution by transits. Vertical and other parabolic curves. Spirals. Railway turnouts and track layouts. String lining of curves. Earthwork and embankment. Haul and the mass diagram. Rights of way. Construction. The construction engineer and professional management. The engineer-contractor. Comparison of various definitions of degree of curve. Highway practice. Aerial photography in route surveying. Problems. Tables. Index.

Note: A standard and widely used instruction book and field reference book for civil engineers and others in the construction industries who are concerned with the surveying of routes or the construction of highways, pipe lines, transmission lines, etc. The first edition was published in 1933 and the second edition in 1951, both under a slightly different title. The greater part of this third edition is identical with that of the second. However, two chapters, one entitled "The construction engineer and professional management" and the other entitled "The engineer-contractor," have been substituted for chapters on observations for meridian and adjustment of instruments that appeared in the second edition. Also a short Addendum and a bibliography of other books have been added to the chapter on aerial photography. Again, there is an extensive and separately paged section of tables. The tables appear to be unchanged from those in the preceding edition.

SEARLES WILLIAM HENRY AND HOWARD CHAPIN IVES

Field engineering a handbook of the theory and practice of railway surveying location, and construction. Twenty-second edition, by Philip Kissam. New York John Wiley & Sons, Inc., 1949 2 v in 1 illus. 18 cm. $8.00. 5478

Contents: Volume I, Text: The location of transportation lines. Reconnaissance. The preliminary survey and projecting location. The location survey. Simple curves. Compound curves. Reversed curves. Turnouts and crossings. The spiral curves. Cross sections. Calculation of earthwork. Earthwork tables. Earthwork diagrams. Haul and the mass diagram. Construction. Track laying. String lining curves. Theory of maximum economy in grades and curves. Leveling under unusual conditions. Adjustment of instruments. Highway curves. Volume II, Tables.

Note: The first edition of this handbook was published in 1880; hence, in its various editions it has served the needs of both students and practicing engineers for over seventy years. Early editions dealt mainly with the location and building of railroads, and the emphasis is still on this subject, but the special problems of highway location and surveying are also covered. This is the first edition revised by Professor Kissam. The first chapter has been added, and important additions having to do with such topics as the preliminary survey aerial mapping, the two-base method for precise altimetry the contraline method of staking out turnouts and yards, and vertical curves are found in other chapters.

SKELTON RUSSELL R.

Route surveys. New York McGraw Hill Book Company Inc., 1949 531 p. illus. 18 cm. $6.50. 5479

Contents: Introduction. The reconnaissance. The preliminary survey. The location survey. Simple circular curves. Compound and reverse curves. Parabolic curves and their applications. Spiral curves. String lining of curves. Earthwork. Earthwork distribution. Right of way. Construction surveys. Elements of turnouts, frogs, and switches. Problems. Tables. Index.

Note: An engineering college textbook and field manual on the surveying of transportation routes. It is general in scope, in the sense that it covers the surveying and location of railway routes, highway routes, transmission line routes, etc. However, the major emphasis is on highway surveying. Practical methods currently in use in the United States of America are covered. Problems for students to solve are included, but these are set off in a separate section where they do not interfere with the use of the book in the field. Approximately half of the space is occupied by a series of useful tables.

TRACY JOHN CLAYTON

Surveying theory and practice. New York John Wiley & Sons, Inc., 1947 1,279 p. illus. 20 cm. $10.75 5480

Contents (abridged): Part I, Field work: Fundamental definitions and concepts. Linear measurements. Basic problems in chaining. Use of the level and the leveling rod. Leveling to establish grade points. Precise differential leveling. Bearings and azimuths. Compass surveying. Use of the transit. Transit surveying—methods of running traverses. Triangulation. Stadia surveying. Plane-table surveying. Topographic surveying. Vertical curves. Horizontal curves. Determination

of a meridian. Part II, Office work Office computations—general directions and suggestions. Calculation of bearings and azimuths. Calculation of omitted measurements. Calculation of areas. Subdivision of land. Earthwork computations. Draftingroom methods. Methods of plotting angles. Methods of plotting traverses. Plotting the map. Profiles and cross sections. Part III, Surveying instruments Introduction. Chains, tapes, and rods. Transits, levels, plane tables, surveyor's compass, sextant. The care of instruments. Part IV Standard surveys Horizontal control surveys. Surveys for construction. Surveys of land boundaries. United States public-land survey Aerial photographic surveys. Tables. Index.

Note. Tracy's *Plane surveying* has been standard instruction and reference book since its original publication in 1907 This new title represents an extensive revision and expansion of the older ork. The purpose—that of providing a comprehensive text for students and reference handbook for practical use in the field and office—is still the same, but the work has been brought up t date and a good deal of new material added.

UNITED STATES ARMY CORPS OF ENGINEERS

Topographic surveying Washington, D C Government Printing Office, 1954 280 p illus 23 cm. (United States. Army Department of the Army technical manual TM5–234) $0 75 5481

Contents: Introduction. Preliminary planning. Field survey Third-order traverse. Fourth-order traverse. Triangulation. Spirit levels. Trigonometric levelling. Polaris. Geodetic astronomy Towers, lights, and targets. Control on aerial photography Control stations. Classification survey Shore-ship triangulation. Appendix References. Specifications for triangulation. Subtense measurements. Altimeter surveying. Standardization of tapes by National Bureau of Standards. Check lists of surveying equipment and sets. Glossary Index.

Note. This is an Army manual for the instruction of topographic surveyors. It covers the practices and techniques approved for use in the prosecution of horizontal and ertical surveys for (1) military topographic map compilation and revision (2) extension of control for military purposes (3) determination of picture-point control for photogrammetric use of aerial photographs, and (4) astronomic fixes. A thorough familiarity with the basic surveying operations described in *Element f surveying* (Department of the Army technical manual TM5-232) is prerequisite for the proper understanding and use of the manual. The bibliography lists surveying publications issued by the U S. Department f Commerce, the U S. Department of the Interior the U S. Department of the Navy and other surveying publications of the U S. Department of the Army vailable through the U S. Government Printing Office.

UNITED STATES BUREAU OF LAND MANAGEMENT

Manual of instructions for the survey of the public lands of the United States 1947 Prepared and published by the Bureau of Land Management. Washington D C Government Printing Office, 1947 613 p illus. 24 cm. $2 75 5482

Content The general plan. Instruments and methods. System of rectangular surveys. Corner monuments. Restoration of lost corners. Resurveys. Special surveys and instructions. Field notes. Plats. Mineral surveys. Appendix. Index. Inserts (folded in pocket) Specimen township plat. Specimen plat, mineral-patent survey and mill site.

Note. This manual supersedes other manuals of similar title issued by the General Land Office between 1855 and 1930. It is "issued for the guidance of all employees ho exercise technical responsibility in the execution of cadastral surveys or resurveys, including the preparation of the field notes and plats thereof in any manner relating to the public domain. It contains the detailed instructions and regulations needed by employees of the Bureau of Land Management in their work presenting the detail of the plan and methods from the point where the subjects are ordinarily concluded in the text books on surveying. A supplement entitled, *Restoration of lost or obliterated corners and subdivision of sections,* was published in 1952.

UNITED STATES BUREAU OF LAND MANAGEMENT

Standard field tables and trigonometric formulas A supplement to the *Manual of instructions for the survey of the public lands of the United States,* Eighth edition, 1956. Prepared in the Division of Cadastral Engineering Washington, D C. Government Printing Office, 1956 245 p. illus. 18 cm. $1 50 5483

Contents: Units of linear measure, units of area, expansion of steel tapes and conversion tables chains to feet and feet to chains. Reduction in latitude to south boundary of township, and corrections for con ergency within a township. Traverse table, for the correction of random lines. Traverse tables. Correction of error in stadia wire interval. Stadia coefficients, vertical rod. Natural sines and cosines. Natural tangents and cotangents. Logarithmic sines, cosines, tangents, and cotangents. Logarithms of numbers. Convergency of meridians, and differences of latitude and longitude. Azimuths of the tangent to the parallel. Offsets of the tangent to the parallel. Azimuths of the secant. Offsets from the secant to the parallel. Lengths of arcs of the earth's surface. Apparent time f sunrise and sunset. Conversion tables, degrees to time, and time to degrees. Sidereal conversions, and reductions to the local mean time of upper culmination of Polaris. Mean refractions in zenith distance. Coefficients to apply to mean refractions for variations in barometer and temperature. Coefficients for computing errors in azimuth, due to small errors in declination or latitude Mean refractions in polar distance. Trigonometric formulas for the solution of plane triangles. Trigonometric formulas for the solution f stadia measurements, observations for time, latitude, and azimuth and problems in convergency Increments of curvature. Conversion tables The arpent and vara units. Metric conversions. Chains and links to feet. Feet to chains and links. Natural factors for conversion of latitudes and departures to differences of latitude and longitude. Logarithmic factors for conversion of latitudes and departures to differences of latitude and longitude.

Note. A pocket-sized manual of tables and formulas for the use of United States of America surveyors and engineers on public land surveys. It is the latest edition of a work originally issued in 1910.

UNITED STATES COAST AND GEODETIC SURVEY

Horizontal control data. Washington, D C. Government Printing Office, 1941 23 p. illus. 23 cm (United States. Coast and Geodetic Survey Special publication no. 227) $0.15 5484

Contents. Field methods and equipment. Office computations and adjustments. Explanation of horizontal control data. Uses for horizontal control data. Use of metric and English units. Cooperation in preservation of marks. Publications.

Note. A companion publication to the Bureau's *Control leveling,* Special publication no. 226, the present work outlines the standards and methods as practiced by the United States Coast and Geodetic Survey in making triangulation observations. Standards of accuracy for first, second, and third order triangulation are included.

UNITED STATES COAST AND GEODETIC SURVEY

Manual of plane-coordinate computation, by Oscar S Adams and Charles N Claire. Washington D C Government Printing Office 1935 271 p illus 23 cm. (United States. Coast and Geodetic Survey Special publication no. 193) $1 00 5485

Contents (abridged) Nature of surveying. Choice of plane systems. Formulas for the Lambert projection. Formulas for the transverse Mercator projection. List of states with their respective grids. Explanation of plane or grid azimuth. Computing plane coordinates on the Lambert and on the transverse Mercator projections. Applications of the grids to computation. Computation of first-order traverse in North Carolina. Scale factors. Adjustment of

quadrilateral. Two short traverse adjustments. Adjustment of small arc of triangulation in an overlap section of two systems. Index.

Note: This manual of computations shows how to use the various systems of plane coordinates or grids (as determined for each of the states of the United States by the Coast and Geodetic Survey) in actual calculations. Although two different systems were used in adapting the grids to the different States, the method of using the results after the coordinates have been computed are essentially the same in both of the systems. Particular attention is given to the type of computation which involves traverse lines starting from a fixed point and ending on another fixed point. The manual also indicates how to pass from one grid system to another including adjustment to different systems of projection. Intended to encourage engineers and surveyors to base their work on geodetic control to co-ordinate it with the national control system.

UNITED STATES. COAST AND GEODETIC SURVEY

Manual of second and third order triangulation and traverse. Revised edition. Washington, D C. Government Printing Office, 1935. 226 p. illus. 23 cm. (United States. Coast and Geodetic Survey Special publication no. 145) $1 00 5486

Contents (abridged) General statement. Reconnaissance. Second and third order triangulation. Second and third order base measurement. Second and third order traverse. Astronomic azimuths. Computations, formulas, and tables. Index.

Note: A reference manual intended to supplement the standard textbooks teaching the basic principles of control surveys. The only discussions of theoretical principles which have been included are those necessary to a proper understanding of field methods. The manual contains condensed specifications for third-order control surveys together with more detailed instructions and specifications for second-order triangulation and horizontal control surveys in conformity with modern requirements and the approved practice of the U.S. Coast and Geodetic Survey. Surveying tables are included.

UNITED STATES. COAST AND GEODETIC SURVEY

Manual of traverse computation on the transverse Mercator grid, by Oscar S Adams and Charles N Claire Washington, D C Government Printing Office, 1935 197 p. illus. 23 cm. (United States. Coast and Geodetic Survey Special publication no. 195) $0.75 5487

Contents (abridged) Introduction. Description of the transverse Mercator projection. Method of computation of the projection. Computation of traverses in the vicinity of Rochester N Y Traverses in New Jersey Grid lines on Geological Survey quadrangle maps. Methods of constructing the meridians and parallels on the grid projection. Transformation of local systems of plane coordinates to grid coordinates. Index.

Note: A supplement to the Bureau's Special publication no. 193, entitled *Manual of plane-coordinate computation*, Washington, 1935, and a companion volume to Special publication no. 194 entitled *Manual of traverse computation on the Lambert grid*, Washington, 1935, now out of print. The transverse Mercator projection, while not as easily illustrated as the Lambert projection, is just as simple in conception and use, and is here illustrated by actual computation examples, from U S Coast and Geodetic traverse surveys made in Rochester, N. Y. and in the vicinity of Newark, N J These were computed especially for this publication and are offered to engineers and surveyors as typical examples of standard practice

PHOTOGRAMMETRY AND CARTOGRAPHY

ADAMS OSCAR SHERMAN

General theory of equivalent projections. Washington, D C. Government Printing Office, 1945 74 p. illus. 25 cm. (United States. Coast and Geodetic Survey Special publication no. 236) $0 40 5488

Contents. Reduction of the spheroid to the sphere. Distortion in length and angle. Examples of one coordinate as an arbitrary function. *Projections with circular parallels.* Lambert's azimuthal equivalent projection. Bonne's projection. Albers equal-area projection. Proposed new projection. *Determination of the axes of the Tissot Indicatrix.* Determination of the directions of the axes. Example of the Indicatrix. Hammer-Aitoff projection. Curves of true scale on equivalent projections. The Lambert azimuthal, equal-area, polar projection. *Tables:* Transformation from geographic to azimuthal coordinates on the authalic sphere—center on the Equator Values of the azimuth reckoned from the north. Values of the great circle distance from the center Functions of authalic latitude for map of world on proposed equal-area projection. Table for an equivalent projection with Lambert, azimuthal, meridional, projection spacing on the central meridian and straight line parallels.

Note: A mathematical treatise on the general principles underlying all projections in which the area is preserved in constant ratio throughout the map in all its parts. Such projections are also called equal-area and sometimes authalic. The publication will be of interest to those concerned with the technical aspects of map projection. Some knowledge of mathematical analysis is necessary to an understanding of its contents.

AMERICAN SOCIETY OF PHOTOGRAMMETRY

Manual of photogrammetry Second edition. Washington, D C. American Society of Photogrammetry 1952 876 p. illus. 26 cm. $12.50. 5489

Contents: The development of photogrammetry by O. D. Whitmore Elements of photogrammetric optics, by R. E. Ash. Cameras: Part 1, Aerial cameras and accessories, by J J Deng. Part 2 Field calibration of aerial mapping cameras, by E. D. Sewell. Part 3, Aerial camera stations, by M. A. Clark. Aerial photography by W R. Harman. Photographic materials and laboratory techniques, by J. L. Tupper, and others. Basic methods of photogrammetry by G. C Tewinkel. *Field surveys for photogrammetry* by the staff of the Maps and Surveys Branch of the Tennessee Valley Authority Radial triangulation, by H. J Keith. Rectification, by R. E. Altenhofen. Preparation of aerial mosaics, by the Technical Staff, Aero Service Corporation. Elements of stereoscopy by A. L. Nowicki. *Photographic interpretation for civil purposes, by R. N Colwell.* Map compilation with the stereometer-type instrument. Photogrammetric plotting instruments, by J. T Pennington. The operation of the multiplex, by E J Lord, Jr. Mapping from oblique photographs by B. B. Lane, Jr. Planning for photogrammetric mapping, by K. B. Walker *Education and training*, by H. O Sharp. *Definition of terms used in photogrammetry* Ready reference list, by D. Landen. Index.

Note: A comprehensive manual, which was prepared under the auspices of the chief professional society in this field in the United States of America. It is addressed to persons with professional interests in the techniques and uses of photogrammetry

BRANCH MELVILLE CAMPBELL, JR.

Aerial photography in urban planning and research. Illustrated by the author Cambridge, Mass. Harvard University Press, 1948. 150 p. illus. 28 cm. (Harvard city planning studies. XIV) $3.00 5490

Contents (abridged) Part 1: The use of aerial photographs for urban planning and research. Vertical stereophotographs. Oblique photographs. Photographic mapping. Cost of aerial surveys. Part 2: Special knowledge prerequisite to the effective use of air photos for urban planning and research. Platforms and plotting. Photo mosaics. Flight planning. Photographic quality Cameras and film. Night photographs. Photographic interpretation. Notes. Index.

Note: A comprehensive study of actual and potential uses of aerial photographs; not only in city planning but also in the regular work of local government units. An example of the latter is the use of such photographs in making tax and assessment maps. In the first part of the volume the various types of aerial photographs, their characteristics and uses, are discussed. In the second part, the technical processes of making aerial photographs, assembling them into maps or mosaics, and interpreting the finished product are covered in adequate detail.

BROWN, LLOYD ARNOLD

The story of maps Boston Little, Brown and Company 1950 397 p illus 26 cm. $10 00 5491

Contents Introduction. The earth takes shape. The habitable world. The world of Claudius Ptolemy The Middle Ages. Charts and the haven-finding art. The map and chart trade. The latitude. The longitude. Survey of a country Survey of a world. Notes. Bibliography Index.

Note. A survey history of the science of mapmaking, written so far as possible from original sources consulted in the chief libraries of the United States of America, and Europe. From the classical world of Egypt, Greece, and Rome, down through the days of Columbus and Magellan, to the Army Map Service of World War II, the story is told with emphasis upon the mapmakers and the methods and apparatus they used rather than upon the charts and maps which they produced. A selective bibliography representative of the literature on cartography arranged under 15 broad subject groupings covers 32 pages at the conclusion of the book. The illustrations number 83 aside from the end papers, which reproduce two Dutch maps of 1541

CHURCH, EARL FRANK, AND ALFRED O QUINN

Elements of photogrammetry Syracuse Syracuse University Press, 1948 120 p illus 24 cm. $3 00 5492

Contents Part I, Fundamental principles Introduction. Fundamental principles of aerial photogrammetry Control of photogrammetric work. Photographic interpretation. Application of the fundamental principles to practical problems in photogrammetry Part II, Practical mapping methods: Stereocomparagraph and contourfinder technique. Planimetric map compilation based upon radial line plotting. Mosaics. Topographic mapping with the multiplex-projector Oblique photographs. Tri-metrogon method for reconnaissance mapping.

Note. A brief review of the fundamental principles and methods of photogrammetry written for an introductory college course. Particular attention is given to the operation and use of various instruments used in the construction of aerial maps. The book is revision of Earl Church's *Elements of aerial photogrammetry* Syracuse, 1944 and now includes brief chapters on the history of photogrammetry control in photogrammic work, and photographic interpretation.

GREENHOOD, DAVID

Down to earth mapping for everybody With illustrations by Ralph Graeter New York Holiday House, 1951 262 p illus 28 cm $5 00 5493

Contents Part I, Getting the most out of maps: The nature of maps. How to find places. Airplanes and square planes. This little means that much. The rose of the winds—direction. Making molehills out of mountains. Flat maps with round meanings. Part II, Making your own Basing maps on other maps. Basing maps upon the ground. Part III, Forming collection Treasures, tools, and materials. Appendix. Index.

Note A well-written popular book. It is addressed to the amateur and is designed to give him an understanding and appreciation of maps whether his interest is that of user collector or maker The style is conversational, and large number of pictorial illustrations clarify the technical details. It was first published in 1944 A number of revisions including the addition of new literature to the annual bibliography were made for the third printing in 1951

LOW JULIAN W

Plane table mapping New York Harper & Brothers, 1952 364 p illus 20 cm. (Harper's geoscience series, Carey Croneis editor) $6 00 5494

Contents Concepts and definitions. Elementary plane table surveying. Plane table triangulation. Small and intermediate scale mapping. Large-scale mapping. Reconnaissance mapping. Adjustments of instruments. Care and repair of instruments. Characteristics of vertical aerial photographs. Plane table applications of vertical photographs. Drawing instruments and their uses. Methods and practice in map construction. Appendix. Index.

Note. A thorough textbook and handbook on the use of the plane table in the construction of engineering and geological maps. The treatment is well organized, and the publisher has given the book an excellent format for its intended use.

NATIONAL GEOGRAPHIC SOCIETY

The round earth on flat paper map projections used by cartographers. By Wellman Chamberlin With drawings by Charles E. Riddiford Map services of the National Geographic Society, by Gilbert Grosvenor 109 illustrations from photographs and drawings, 16 pages of maps from the National Geographic Magazine. Washington, D C. National Geographic Society, 1950 126 p illus. 25 cm $1 00 5495

Contents Map services of the National Geographic Society by G. Grosvenor Projections used for National Geographic Society maps. The round earth on flat paper—map projections used by cartographers, by W Chamberlin. Eight typical maps from the *National Geographic Magazine.* National Geographic Society ten-color maps.

Note The article, "The round earth on flat paper which occupies pages 39–103 of this publication, is its principal feature. This article is semitechnical description of cartographic methods. It includes a lucid discussion of the problem of accurately representing areas of a global earth on plane maps and describes in some detail the principal projections that have been evolved to partially surmount the difficulties. It throws much light on the study and reading of maps.

RAISZ, ERWIN

General cartography Second edition. New York McGraw Hill Book Company, Inc. 1948 354 p illus. 26 cm. (McGraw Hill series in geography, V C. Finch, consulting editor) $7 50 5496

Contents. Book one, General cartography: Part I, The history of maps. Part II, Scales and projections. Part III Representation of the earth's pattern on maps. Part IV Lettering, composition, and drafting of maps. Book two, Special cartography: Part V Surveying on the ground and from the air Part VI, Official and professional maps. Part VII, Cartographic specialties. Part VIII, Science maps. Appendix. Index.

Note This well-written and comprehensive text on the science of map-making is intended primarily for use in college courses, but its readable style will also appeal to the interested layman. It is concerned, not so much with the actual techniques of map-making, as with the fundamental principles and problems of the art of mapping. The broad scope of the earlier edition has been further augmented by the addition of new chapters on ground and aerial surveying. Map projections and military maps are discussed at greater length, and the bibliography has been revised and brought up to date.

ROBINSON, ARTHUR HOWARD

The look of maps, an examination of cartographic design Madison The University of Wisconsin Press 1952 105 p illus. 24 cm. $2 75 5497

Content Toward better cartography The cartographic technique. Cartography as visual technique. The importance of lettering. The style of lettering. The employment of lettering. Map structure. Map design. Color in cartography The employment of color. A selected bibliography

Note As the subtitle indicates, this book is a study of the visual or graphic design aspects of maps. It is written for cartographers and others who may be concerned with the design of maps, and from that viewpoint it presents the current scientific knowledge of the legibility of type faces, the perimeral factors in color perception, etc. Selected bibliographies are included.

Photogrammetry

SHARP, H. OAKLEY
Practical photogrammetry New York The Macmillan Company 1951 229 p illus. 21 cm. $4.50. 5498

Contents. Part [illegible] Photogrammetry Camera. Perspective. Terrestrial photographic surveying. Aerial photogrammetry Stereoscopy Compilation of maps. Control surveys. Planimetric and topographic details. Part [illegible] Practical applications. Tilt and rectification. Planning an aerial survey. Specifications for aerial photography and mapping. Appendix. Index.

Note A compact, introductory survey of fundamentals, current techniques, and uses of photogrammetry [illegible] itten for engineering students and graduate engineers rather than for aerial photographers and specialists in photogrammetry Among the 90 figures are numerous reproductions of photographs of plotting equipment and related devices. There is no bibliography

SLOANE, ROSCOE C., AND JOHN M MONTZ
Elements of topographic drawing. Second edition. New York McGraw Hill Book Company Inc., 1943 251 p. illus. (part col d) 23 cm. $6.00. 5499

Contents Topographic drawing. Conventional signs. Topographic mapping. Topographic drawing in colors. Contours and contour sketching. Copying—duplication—reproduction Map projections. Suggestions for office practice. Suggested problems.

Note A fully illustrated book, used both in the instruction of draftsmen and as [illegible] reference book by topographic draftsmen and general draftsmen [illegible] they are called upon to draw maps. It provides explicit information on symbols, techniques, instruments and methods of reproduction.

SMITH HAROLD THEODORE UHR
Aerial photographs and their applications. New York D Appleton-Century Company Inc., 1943 372 p. illus. 24 cm. (The Century earth science series K. F Mather editor) $5.00. 5500

Contents. Introduction Characteristics of aerial photos. Stereoscopic study of aerial photos. General principles of photo interpretation. Geographic and topographic interpretation. Planimetric maps from vertical photos. Planimetric maps from oblique photos. Photomosaics. Contour maps from aerial photos. Geologic interpretation. Physiographic interpretation Aerial photos in economic geology engineering, and other fields Military applications.

Note A practical, profusely illustrated textbook that provides knowledge of the simpler methods of making maps from aerial photographs and gives thorough instruction in the interpretation of photographs with special reference to the geologic point of view but with attention also to the problems of the engineer geographer and military scientist

SWANSON L. W AND OTHERS
Topographic manual. Part II, Photogrammetry Washington D C. Government Printing Office, 1949 570 p. illus. 26 cm. (United States. Coast and Geodetic Survey Special publication no. 249) $3 25 5501

Contents (abridged) Preliminary office procedures Requirements for map accuracy Outline of operations Equipment and instruments for photogrammetric offices. Aerial photography by R M. Berry: Coast and Geodetic Survey use of aerial photographs. Season and weather. Cameras and materials. Airplanes, instruments, and accessories. General instructions for aerial photography Flight planning. Laboratory processing and records. Photogrammetric theory by G. C Tewinkel Optical principles The vertical aerial photograph. Stereoscopy The near-vertical photograph. Tilt determination. Rectification. Radial-plot procedures Determination of the average scale of photographs. Projection and grid construction Control station data. Radial-plot assembly of nine-lens photographs with hand templets. Radial-plot assembly of single-lens photographs with hand templets—with mechanical templets. Direct radial plotting. Map manuscript delineation Photograph interpretation. Orientation and adjustment for delineation. Three-point contour lines. Scaling of positions. Stereoscopic plotting instruments, by G C Tewinkel The two-lens method. The multiplex projector The stereoplanigraph. Records and reports, by R. G. Jones: Records and reports for photogrammetric mapping. Smooth drafting and publication. Map revision. Coordination of photogrammetric and hydrographic surveys. Trimetrogon mapping. The Schneider stereoscope. Reference books. Index.

Note: The work describes, with appropriate illustrations, the methods of Coast and Geodetic Survey in the making of maps from aerial photographs. The publication is the second part of [illegible] complete Topographic Manual being prepared by the Coast and Geodetic Survey Part [illegible] (out of print) contains the requirements and detailed instructions for field topographic surveys, including plane table surveys without using aerial photographs and photogrammetric field survey [illegible] made for the compilation of maps from aerial photographs.

THOMAS, PAUL D
Conformal projections in geodesy and cartography Washington D C. United States Government Printing Office, 1952 142 p. illus. 26 cm (United States. Coast and Geodetic Survey Special publication no. 251) $0.60 5502

Contents (abridged) Mapping formulas: Mercator projection—transverse Mercator projection—oblique Mercator projection. Lambert conformal conic projection—one standard parallel—two standard parallels. Stereographic projection—polar—meridian—horizon—polar coordinates for the stereographic projections of the sphere. Derivation of mapping formulas. Bibliography Index.

Note The mathematical formulas for the various projections named in the above table of contents are collected in the first 15 pages of this work for the convenience of those who are practically concerned with geodetic computations and cartography. The remainder of the space is devoted to [illegible] short account of complex variable theory and to derivations of the formulas. Short accounts of the history of each projection are included. The publication supersedes O. S. Adams, *General theory of the Lambert conformal conic projection*, Washington, D. C., 1918, and includes material selected from several other publications of the Coast and Geodetic Survey

UNITED STATES. COAST AND GEODETIC SURVEY
Elements of map projection with applications to map and chart construction, by Charles H. Deetz and Oscar L. Adams. Fifth edition, revised 1944 Washington D C. Government Printing Office 1944 226 p. illus. 25 cm. (United States. Coast and Geodetic Survey Special publication no. 68) $2.25 5503

Contents (abridged) General statement. Analysis of the basic elements of map projection. Representation of the sphere upon plane. Elementary description of various forms of projection. The polyconic projection. The Bonne projection. The Lambert azimuthal (or zenithal) equal-area projection. The Lambert conformal conic projection with two standard parallels. The grid system of military mapping. The Albers conical equal-area projection with two standard parallels. The Mercator projection. Fixing position by wireless directional bearings. World maps: The Mercator projection. The stereographic projection. The Aitoff equal-area projection of the sphere The Mollweide homalographic projection. Goode's homalographic projection (interrupted) for the continents and oceans. Lambert's projection of the northern and southern hemispheres Conformal projection of the sphere within [illegible] two-cusped epicycloid. Guyou's doubly periodic projection of the sphere. Recent contributions to world mapping. Index.

Note A concise presentation of the theory and practice of map projection for the student of cartography as well as for the layman who makes use of maps in his work. Mathematical theory for the more important projections is presented and there are tables for the construction of Mercator and Lambert projections. Ten plates of specimen maps are included.

UNITED STATES DEPARTMENT OF THE ARMY
A guide to the compilation and revision of maps. Washington, D C Government Print

BROWN, LLOYD ARNOLD

The story of maps. Boston Little, Brown and Company, 1950 397 p illus. 26 cm $10.00 5491

Contents Introduction. The earth takes shape. The habitable world. The world of Claudius Ptolemy The Middle Ages. Charts and the haven-finding art. The map and chart trade. The latitude. The longitude. Survey of a country Survey of a world. Notes. Bibliography Index.

Note A survey history of the science of mapmaking, written so far as possible from original sources consulted in the chief libraries of the United States of America, and Europe. From the classical world of Egypt, Greece, and Rome, down through the days of Columbus and Magellan, to the Army Map Service of World War II, the story is told with emphasis upon the mapmakers and the methods and apparatus they used rather than upon the charts and maps which they produced. A selective bibliography representative of the literature on cartography arranged under 15 broad subject groupings covers 32 pages at the conclusion of the book. The illustrations number 83 aside from the end papers, which reproduce two Dutch maps of 1583

CHURCH, EARL FRANK, AND ALFRED O QUINN

Elements of photogrammetry Syracuse Syracuse University Press, 1948 120 p illus. 24 cm. $3 00 5492

Contents Part I, Fundamental principles Introduction. Fundamental principles of aerial photogrammetry Control of photogrammetric work. Photographic interpretation. Application of the fundamental principles to practical problems in photogrammetry Part II, Practical mapping methods: Stereocomparagraph and contourfinder technique. Planimetric map compilation based upon radial line plotting. Mosaics. Topographic mapping with the multiplex-projector Oblique photographs. Tri-metrogon method for reconnaissance mapping.

Note A brief review of the fundamental principles and methods of photogrammetry written for an introductory college course. Particular attention is given to the operation and use of various instruments used in the construction of aerial maps. The book is a revision of Earl Church's *Elements of aerial photogrammetry* Syracuse, 1944 and now includes brief chapters on the history of photogrammetry control of photogrammetric work, and photographic interpretation.

GREENHOOD, DAVID

Down to earth, mapping for everybody With illustrations by Ralph Graeter New York Holiday House, 1951 262 p illus 28 cm $5 00 5493

Contents Part I, Getting the most out of maps: The nature of maps. How to find places. Airplanes and square planes. This little means that much. The rose of the winds—direction. Making molehills out of mountains. Flat maps with round meanings. Part II, Making your own: Basing maps on other maps. Basing maps upon the ground. Part III, Forming a collection Treasures, tools, and materials. Appendix. Index.

Note A well-written popular book. It is addressed to the amateur and is designed to give him an understanding and appreciation of maps whether his interest is that of a user collector or maker The style is conversational, and a large number of pictorial illustrations clarify the technical details. It was first published in 1944 A number of revisions including the addition of new literature to the useful bibliography were made for the third printing in 1951

LOW JULIAN W

Plane table mapping New York Harper & Brothers 1952 364 p illus. 20 cm (Harper's geoscience series Carey Croneis editor) $6 00 5494

Contents. Concepts and definitions. Elementary plane table surveying. Plane table triangulation. Small and intermediate scale mapping. Large-scale mapping. Reconnaissance mapping *Adjustments of instruments.* Care and repair of instruments. Characteristics of vertical aerial photographs. Plane table applications of vertical photographs. Drawing instruments and their uses. Methods and practice in map construction. Appendix. Index.

Note. A thorough textbook and handbook on the use of the plane table in the construction of engineering and geological maps. The treatment is well organized, and the publisher has given the book an excellent format for its intended use.

NATIONAL GEOGRAPHIC SOCIETY

The round earth on flat paper, map projections used by cartographers. By Wellman Chamberlin With drawings by Charles E. Riddiford. Map services of the National Geographic Society, by Gilbert Grosvenor 109 illustrations from photographs and drawings, 16 pages of maps from the National Geographic Magazine Washington, D C. National Geographic Society, 1950 126 p. illus. 25 cm $1 00 5495

Contents: Map services of the National Geographic Society by G. Grosvenor Projections used for National Geographic Society maps. The round earth on flat paper—map projections used by cartographers, by W Chamberlin. Eight typical maps from the *National Geographic Magazine.* National Geographic Society ten-color maps.

Note. The article "The round earth on flat paper which occupies pages 39–103 of this publication, is its principal feature. This article is a semitechnical description of cartographic methods. It includes a lucid discussion of the problem of accurately representing areas of a global earth on plane maps and describes in some detail the principal projections that have been evolved to partially surmount the difficulties. It throws much light on the study and reading of maps.

RAISZ, ERWIN

General cartography Second edition. New York McGraw Hill Book Company, Inc., 1948 354 p. illus. 26 cm (McGraw Hill series in geography V C. Finch, consulting editor) $7 50 5496

Contents. Book one, General cartography: Part I, The history of maps. Part II, Scales and projections. Part III, Representation of the earth's pattern on maps. Part IV Lettering, composition, and drafting of maps. Book two, Special cartography: Part V, Surveying on the ground and from the air Part VI, Official and professional maps. Part VII, Cartographic specialties. Part VIII, Science maps. Appendix. Index.

Note. This well-written and comprehensive text on the science of map-making is intended primarily for use in college courses, but its readable style will also appeal to the interested layman. It is concerned, not so much with the actual techniques of map-making, as with the fundamental principles and problems of the art of mapping. The broad scope of the earlier edition has been further augmented by the addition of new chapters on ground and aerial surveying. Map projections and military maps are discussed at greater length, and the bibliography has been revised and brought up to date.

ROBINSON ARTHUR HOWARD

The look of maps an examination of cartographic design Madison The University of Wisconsin Press 1952 105 p. illus 24 cm. $2 75 5497

Contents Toward better cartography The cartographic technique. Cartography as a visual technique The importance of lettering. The style of lettering. The employment of lettering. Map structure. Map design. Color in cartography The employment of color. A selected bibliography

Note As the subtitle indicates, this book is a study of the visual or graphic design aspects of maps. It is written for cartographers and others who may be concerned with the design of maps, and from this viewpoint it presents the current scientific knowledge of the legibility of type faces, the pertinent factors in color perception, etc. Selected bibliographies are included.

SHARP H. OAKLEY

Practical photogrammetry New York The Macmillan Company 1951 229 p. illus. 21 cm. $4.50. 5498

Contents. Part I: Photogrammetry. Camera. Perspective. Terrestrial photographic surveying. Aerial photogrammetry. Stereoscopy. Construction of maps. Control surveys. Planimetric and topographic details. Part II: Practical applications. Tilt and rectification. Planning an aerial survey. Specifications for aerial photography and mapping. Appendix. Index.

Note: A compact, introductory survey of fundamentals, current techniques, and uses of photogrammetry written for engineering students and graduate engineers rather than for aerial photographers and specialists in photogrammetry. Among the 90 figures are numerous reproductions of photographs of plotting equipment and related devices. There is no bibliography.

SLOANE, ROSCOE C. AND JOHN M. MONTZ

Elements of topographic drawing. Second edition. New York McGraw Hill Book Company Inc., 1943 251 p. illus. (part col'd) 23 cm. $6.00 5499

Contents: Topographic drawing. Conventional signs. Topographic maps. Topographic drawing in colors. Contours and contour sketches. Copying—duplication—reproduction. Map projections. Lettering for office practice. Suggested problems.

Note: A fully illustrated book, used both in the instruction of draftsmen and as a reference book by topographic draftsmen and [illegible] draftsmen when they are called upon to draw maps. It provides explicit information on symbols, techniques, instruments and methods of reproduction.

SMITH, HAROLD THEODORE UHR

Aerial photographs and their applications. New York. D. Appleton-Century Company Inc., 1943 372 p. illus. 24 cm. (The Century earth science series K. F. Mather editor) $5.00. 5500

Contents: Introduction. Characteristics of aerial photos. Stereoscopic study of aerial photos. General principles of photo interpretation. Geographic and topographic interpretation. Planimetric maps from vertical photos. Planimetric maps from oblique photos. Photomosaics. Contour maps from aerial photos. Geologic interpretation. Physiographic interpretation. Aerial photos in economic geology, engineering, and other fields. Military applications.

Note: A practical, profusely illustrated textbook that provides knowledge of the simpler methods of making maps from aerial photographs and gives thorough instruction in the interpretation of photographs with special reference to the geologic point of view but with attention also to the problems of the engineer, geographer and military science.

SWANSON L. W. AND OTHERS

Topographic manual. Part II Photogrammetry Washington D. C. Government Printing Office, 1949 570 p. illus. 26 cm. (United States. Coast and Geodetic Survey Special publication no. 249) $3.25 5501

Contents (abridged): Preliminary office procedure. Requirements for map accuracy. Outline of operations. Equipment and instruments for photogrammetric office. Aerial photography by R. M. Berry: Coast and Geodetic Survey use of aerial photographs. Season and weather. Cameras and materials. Airplanes, instruments, and accessories. General instructions for aerial photography. Flight planning. Laboratory processing and records. Photogrammetric theory by O. C. Trimble: Optical principles. The vertical aerial photograph. Stereoscopy. The near-vertical photograph. Tilt determination. Radial-line [illegible]. Radial-plot procedures. Determination of the average scale of photographs. Projection and grid construction. Control station data. Radial-plot assembly of nine-lens photographs with hand templets. Radial-plot assembly of single-lens photographs with hand templets—with mechanical templets. Direct radial plotting. Map manuscript delineation. Photograph interpretation. Orientation and adjustment for delineation. Three-point contact from finding of position. Stereoscopic plotting instruments, by O. C. Trimble. The ten-lens method. The multiplex projector. The stereoplanigraph. Records and reports, by E. G. Jones: Records and reports for photogrammetric mapping. Smooth drafting and publication. Map revision. Coordination of photogrammetric and hydrographic surveys. Trimetrogon mapping. The Schneider stereoscope. Reference books. Index.

Note: The work describes, with appropriate illustrations, the methods of Coast and Geodetic Survey in the making of maps from aerial photographs. The publication is the second part of a complete Topographic Manual being prepared by the Coast and Geodetic Survey. Part I (out of print) contains the requirements and detailed instructions for field topographic surveys, including plane table surveys without using aerial photographs and photogrammetric field surveys made for the compilation of maps from aerial photographs.

THOMAS PAUL D

Conformal projections in geodesy and cartography Washington D. C. United States Government Printing Office 1952 142 p. illus. 26 cm (United States Coast and Geodetic Survey Special publication no. 251) $0.60 5502

Contents (abridged): Mapping formulas: Mercator projection—transverse Mercator projection—oblique Mercator projection. Lambert conformal conic projection—one standard parallel—two standard parallels. Stereographic projection—polar—meridian—horizon—polar coordinates for the stereographic projections of the sphere. Derivation of mapping formulas. Bibliography. Index.

Note: The mathematical formulas for the various projections named in the above table of contents are collected in the first 15 pages of this work for the convenience of those who are practically concerned with geodetic computations and cartography. The remainder of the space is devoted to a short account of complex variable theory and to derivations of the formulas. Short accounts of the history of each projection are included. The publication supersedes O. S. Adams, *General theory of the Lambert conformal conic projection*, Washington, D. C., 1918, and includes material selected from several other publications of the Coast and Geodetic Survey.

UNITED STATES. COAST AND GEODETIC SURVEY

Elements of map projection, with applications to map and chart construction, by Charles H. Deetz and Oscar L. Adams. Fifth edition revised 1944 Washington D. C. Government Printing Office 1944 226 p. illus. 25 cm. (United States. Coast and Geodetic Survey Special publication no. 68) $2.25 5503

Contents (abridged): General statement. Analysis of the basic elements of map projection. Representation of the sphere upon a plane. Elementary discussion of various forms of projection. The polyconic projection. The Bonne projection. The Lambert zenithal (or azimuthal) equal-area projection. The Lambert conformal conic projection with two standard parallels. The grid system of military mapping. The Albers conical equal-area projection with two standard parallels. The Mercator projection. Fixing position by wireless directional bearings. World maps. The Mercator projection. The stereographic projection. The Aitoff equal-area projection of the sphere. The Mollweide homalographic projection. Goode's homolographic projection (interrupted) for the continents and oceans. Lambert projection of the northern and southern hemispheres. Conformal projection of the sphere within a two-cusped epicycloid. [illegible] doubly periodic projection of the sphere. Recent contributions to world mapping. Index.

Note: A concise presentation of the theory and practice of map projection for the student of cartography as well as for the layman who makes use of maps in his work. Mathematical theory for the more important projections is presented and there are tables for the construction of Mercator and Lambert projections. Ten plates of specimen maps are included.

UNITED STATES. DEPARTMENT OF THE ARMY

A guide to the compilation and revision of maps. Washington, D. C. Government Print

ing Office, 1955 167 p illus 26 cm. (United States. Department of the Army Technical manual no 5 240) $1 00 5504

Contents. Introduction. Cartographic drafting techniques. Collection of source material. Preparation of the compilation base Projections. Grids. Control. Plotting techniques. Compiling General. Photo interpretation for mapping. Shop methods and techniques. Final drafting. Map revision. Map editing. Introduction to photomaps. Extension and adjustment f controls Plotted bases. Extension of control from picture points. Control of mosaics. Techniques of laying mosaics. Trimetrogon charting. Appendices References. Plastic scribing. Field mapping expedients. Mapping from single high oblique photographs. Parallax tables. Edit checklist. Glossary Index.

Note This manual provides single text on the techniques of map compilation and drafting for the guidance of personnel whose duties include map compiling, cartographic drafting, and map editing. The manual covers the construction of map projection and grids the compilation and revision of maps from aerial photographs or map manuscripts by specialized phases of topographic drafting, and the preparation of mosaics, annotated photographs, hasty maps, and other map substitutes. It supersedes the 1944 edition of the same manual.

UNITED STATES DEPARTMENT OF THE ARMY

Map reading Washington, D C Government Printing Office, 1956 253 p. illus. (part col'd) 23 cm (United States. Department of the Army Field manual FM 21 26) $1 00 5505

Contents Part I, Introduction to use of maps. General. Basic map reading. Part II, Point location Map measurements. Grids and grid reference systems. Location by intersection and resection. Use f field sketching in description of location. Part III, Land navigation by dead reckoning General. Instruments of land navigation. Direction finding. Ground distance measurement. Recording and maintaining course. Part IV Map substitutes and supplements Importance of map substitutes. Aerial photographs. Mosaics and photomaps. Overlays and overprints. Third dimension map substitutes. Appendices References. General map information. Classification of maps. Map standards. Conversion factors of measurement. Projections. Glossary Index.

Note This work has dual purpose to guide the instructor of classes studying the basic concepts of map reading and to provide an advanced reference text of map using and reading. The first part of the manual expresses the basic map-reading principles which the soldier must follow to use military map for the purposes for which it was made. The subsequent parts of the manual present more detailed information on map reading, including related subjects such as sketching and land navigation. The volume contains over 120 illustrations, including a folded large-scale military map in color

UNITED STATES LIBRARY OF CONGRESS MAP DIVISION

Three-dimensional maps an annotated list of references relating to the construction and use of terrain models Compiled by Walter W Ristow Washington The Library of Congress 1951 43 p 26 cm $0.35 5506

Note. The 234 references cited in this bibliography provide comprehensive listing of articles and books published from 1666 to June, 1951 Most of the references cover publications of the past ten or twenty years and describe the construction and use of terrain models made of plaster of Paris, plastics, and rubber The entries are annotated and arranged alphabetically by author A brief subject index is included.

STRUCTURAL ANALYSIS AND DESIGN

ALBERT, ODD

Elastic behavior of structural members 'the frame constant method' Belmar N J Opla Company, 1956 280 p illus. 23 cm. $6 50 5507

Contents Cantilever beam with constant moment of inertia. Elastic behavior of structural members. The moment equations using the support angles. The unit beam. Unit beam subject to concentrated loads. Deflecting supports. General behavior of the continuous girder Continuous girder of two spans. Continuous girder of three spans. Continuous girder of four spans. Continuous girder of five spans. Continuous girder of six spans. Moment applied at a support.

Note Presented in this book is a method of analysis which the author has described as follows: "The deflections of the free end of fixed cantilever beam under various types of loading furnish the basis for simple method of determining the elastic behavior of beams and frames. The method is based upon the various deflections of the free end of member considered as fully restrained cantilever beam with all the direct loads applied and the influences of all other members in the system considered as loads. Thus, direct load will tend to bend the free end up, and an imaginary reaction at the free end will tend to bend this end up or down depending upon its direction. A moment at the free end will bend it up or down, according to its direction. The method was developed gradually over a long experience of study engineering practice and teaching in Sweden and the United States of America.

AMERICAN SOCIETY OF CIVIL ENGINEERS

Design of cylindrical concrete shell roofs. Prepared by the Committee on Masonry and Reinforced Concrete of the Structural Division through its Subcommittee on Thin Shell Design New York American Society of Civil Engineers 1952 177 p illus. 23 cm. (American Society of Civil Engineers. Manuals of engineering practice no 31) $5 00 5508

Contents Introduction. History of shell design theories. Design procedure. Design examples, long shells, simply supported. Design example, long shells, continuous over support. Design example, short shell simply supported. Design of transverse stiffeners. Effect of continuity of shell and transverse stiffener Elastic stability of shells. Appendices. References on the design of barrel shells. Theory Notation.

Note An authoritative and useful work. Design procedures are the primary topic, and approximately 100 pages are devoted to them. However the theory is derived mathematically in a 71-page appendix. Many tables and charts which simplify the computational work in connection with the design of concrete shell roofs are included The international literature published 1915–1950 is cited in the bibliography

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on structural sandwich construction Presented at the fifty fourth annual meeting American Society for Testing Materials Atlantic City N J., June 21 1951 Philadelphia American Society for Testing Materials, 1952 114 p. illus. 23 cm (Special technical publication no 118) $2 00. 5509

Contents Introduction, by A. G H. Dietz. Developments and trends in lightweight composite construction, by L. J. Markwardt. Sandwich construction in the elastic range, by H. W March. Strength of sandwich construction, by C. B Norris. Compressive and Strength of sandwich construction, by C. B Norris. Compressive and torsional instability of sandwich cylinders, by G. Gerard. Paper honeycomb as core for structural sandwich construction, by E. W Kuenzi. Aluminum honeycomb sandwich construction, by T. P Pajak. Some developments in structural sandwich building panels having inorganic cores, by G. M Rapp. Fabrication techniques for structural sandwich constructions, by R. G. Hecht.

Note. Sandwich constructions consisting of thin strong facings bonded to lightweight cores are designed to provide strong light structures. These papers describe the composition, engineering properties, and methods of testing various types of "sandwiches. They have been prepared by experts in this field and report on experimental work conducted by the authors. Bibliographies and brief discussions are included. Of interest to structural engineers and architects.

ANDERSEN, PAUL

Statically indeterminate structures their analysis and design. New York. The Ronald Press Company 1953 318 p. illus. 24 cm. $7.50. 5510

Contents: Basic principles of structural analysis. Deflection of beams. Deflection of trusses. Consistent deflections and least work. The slope-deflection method. Moment-distribution method. Frames with different joint translations. Settlement and temperature stresses. Design of continuous frames. Tapered and haunched members. Wind-stress analysis. Space frames. Appendix—charts—tables. Index.

Note: As indicated in the sub-title, this introduction to statically indeterminate structures deals not only with analysis but also with design. However, the primary subject is analysis and applications to design are included chiefly to illustrate the interest of the engineering course students for whom the book is intended. A number of problems that occur in practical design but which are often omitted from introductory texts are considered such as design to allow for foundation settlement, and design of horizontally curved beams. Such topics cannot be neglected. The book is well organized and adequately illustrated. The author is Professor of Structural Engineering in the University of Minnesota.

BLEICH, FRIEDRICH

Buckling strength of metal structures. With the collaboration of Commander Lyle B Ramsey Edited by Hans H Bleich. New York. McGraw Hill Book Company Inc. 1952. 508 p. 24 cm. (Engineering Societies monographs Ralph H. Phelps, consulting editor) $12.00. 5511

Contents: Buckling of centrally or eccentrically loaded columns. The mathematical treatment of stability problems and the stability criteria. Buckling of centrally loaded columns by torsion and flexure. Lateral buckling of beams. Built-up columns and columns of variable cross-section. The stability of frameworks. The effective length of compression members in trusses and the stability of rigid-frame structures. Stability of axially compressed bars elastically supported at specific points. Local buckling of plate elements of columns. Rectangular plates with longitudinal stiffeners. Stability of web plates of girders. Special problems in the design of ship plating. Author index. Subject index.

Note: The result of a planned effort sponsored by the Bureau of Ships of the United States Navy to assemble reliable data on the analysis of fabricated steel structures under compressive loading. The literature of the subject has been surveyed, critically evaluated, and useful data and methods have been synthesized to form a manual for practical use by graduate engineers. Not only are the larger aspects of the subject, such as are mentioned in the chapter titles, covered, but there are also discussions of many small points, such as the safety factor in short columns as compared to long columns. The methods and formulas presented are particularly applicable to the design of ship hulls and other heavy structures. The book is not intended for use in the design of light structures, such as airplane frames.

CISSEL, JAMES HARLAN

Stress analysis and design of elementary structures. Second edition. New York John Wiley & Sons, Inc., 1948 419 p. illus. 23 cm. $7.00. 5512

Contents: Part I. Stress analysis: Introduction—Definitions. External forces—Loads. Graphic statics. [illegible] Restrained and continuous beams. Trusses. Stability of masonry structures and foundations. Part II. Design of simple structures. Structural fastenings and connections. Timber beams and columns. Steel tension members, columns, beams, and girders. Light-gage steel construction. Reinforced concrete beams, slabs, and columns. Appendix. Index.

Note: The author designed this volume as an introductory exposition for the instruction of general engineering classes. It presupposes an elementary knowledge of statics and strength of materials. Part I is virtually unchanged from the first edition (1940) while Part II shows considerable revision, and many new pages of problems have been added throughout the text. The chapter on light-gage steel construction is new and newly added tables of standards, properties, sizes, and other material specifications appear in the appendix.

GRINTER, LINTON ELIAS

Automatic design of continuous frames in steel and reinforced concrete. New York The Macmillan Company 1939 141 p. illus. 23 cm. $5.00. 5513

Contents: Philosophy of automatic design for continuous structures. Modern methods of analysis of continuous frames. Automatic design of continuous frames. Automatic design of continuous frames. Automatic design with haunched members. Analysis of continuous frames by balancing angle changes. Determining influence lines by balancing angle changes. Index.

Note: Revising the old system of repeated analysis and design into a single procedure of successive corrections, this book presents a method which the author terms "automatic design" as applied to problems of structural engineering. The book is intended to supplement other texts, including the author's, on the theory and design of structures.

GRINTER, LINTON ELIAS

Design of modern steel structures. New York The Macmillan Company 1941 452 p. illus. 23 cm. $7.00. 5514

Contents (abridged): Riveted connections. Internal action of riveted joints. Rivet resistance. Eccentricity in riveted connections. Design of seat and connection angles. Welded connections. Arrangement of structural welds. Stress analysis for welds. Throat and root stresses in fillet welds. Design of structural welds. Pins and bolts for connections: Pin design. Pin plates. Timber construction: Holding power of nails and screws. Bolted joints in timber. Timber connectors. Tension members: Bars and rods. Structural shapes. Built-up tension members. Compression members. Column action. Column design. Truss members. Beams and girders. Fundamental theory. Buckling resistance of beams. Floor design. Strengthening old structures. Combined direct stress and flexure: Theory of combined action. Stress and stability: Maximum stresses. Bearing stresses. Plate design. Buckling of plates. Stress concentration. Torsion of beam sections. Design of plate girders. Roofs for industrial buildings: Riveted truss design. Welded truss design. Design of a low truss highway bridge. Office buildings. Examples of functional arrangement. Design and construction details. Design of a tall building: Floor arrangement. Column selection. Wind resistance by stories. Design of continuous beams. Special design problems. Specifications. Index.

Note: A companion volume to Grinter, *Theory of modern steel structures*, Volume I, described below. These two books are intended to cover all of the problems of analysis and design that can be treated to advantage in the usual undergraduate college courses in statically determinate structures. There is considerable emphasis in this volume upon the design of structural members and structural joints both in timber and in steel.

GRINTER, LINTON ELIAS

Elementary structural analysis and design, steel timber and reinforced concrete. New York The Macmillan Company 1942 383 p. illus. 24 cm. $6.00 5515

Contents: Design and construction. The tools of stress analysis. Industrial buildings. Riveted connections. Welded connections. Pins and bolted connections. Tension and compression members. Rolled beams and girders. Plate-girder design. Roofs for industrial buildings. Timber construction. Timber roof truss design. Reinforced concrete construction. Reinforced concrete beams and slabs. Reinforced concrete columns. Wall and column footings. Formulas and charts for reinforced concrete design. Specifications. Index.

Note: This volume is especially designed for architects, mechanical engineers, sanitary engineers, and others not specializing in bridge design. It covers both the analysis and design of simple structures of steel, timber and reinforced concrete. For timber structures, the use of modern timber connectors and the design of roof trusses with timber connectors are treated. Reinforced concrete beams, slabs, columns, and footings are discussed in the light of the 1940 report of the Joint Committee on Concrete and Reinforced Concrete. The major design problems on the steel roof truss and the steel girder are solved for both riveted and welded structures. Fifty design sheets illustrate the solution of typical design problems as they would be solved in a design office.

GRINTER, LINTON ELIAS

Theory of modern steel structures Revised edition. New York The Macmillan Company, 1949 2 vol. illus 24 cm $6 00 per vol. 5516

Contents Vol. I, Statically determinate structures. Introduction. The theory of stress analysis. Industrial buildings. Industrial building bents. Truss bridges—dead loading—highway loadings—railway loadings. Lateral and portal bracing of bridges. The plate girder. Office and commercial buildings. Wind stresses in tier buildings. Index. Vol. II, Statically indeterminate structures and space frames. Analysis and design of indeterminate structures. Framed structures in space. Deflections of structures. Classical methods of analysis of indeterminate structures. Analysis of continuous frames by moment distribution. Analysis of continuous frames by balancing end angle changes. Influence lines and maximum moment curves for continuous, movable and long-span bridges. Analysis of arches and closed rings. Index.

Note. A successful introductory textbook for engineering colleges. It is used also for self-instruction and review by practicing engineers. Addressed to those who are preparing for careers in structural engineering, it not only provides reliable expositions of modern methods of stress analysis and structural design but also mentions outstanding names and structures in the development of structural engineering and pictures ancient and modern structures. Both graphical and algebraic methods of analysis are explained. Important revisions and additions were made in preparing this edition.

HARRIS, CHARLES OVERTON

Elementary structural design. Chicago American Technical Society, 1951 163 p illus 29 cm. $5.25 5517

Contents Fundamentals. Equilibrium. Centroid of an area. Moment of inertia. Simple stress and strain. Beams. Beams of standard section. Deflection of beam. Statically indeterminate beams. Reinforced-concrete floor slabs. Bending combined with tension or compression. Compression members. Structural connections. Answers to problems. Index.

Note. A home-study text that is exceptionally well written and well organized. The discussions are full and clear and the author has included generous number of worked examples. There are many illustrations—most of them diagrams—and also practice problems and review problems.

HARRIS, ERNEST C

Elements of structural engineering New York The Ronald Press Company, 1954 505 p illus 24 cm $7 00 5518

Contents Introduction. Equilibrium and reactions. Shear thrust, and bending moment. Analysis f trusses and bracing. Analysis with moving loads. Deflections in beams. Design in steel—members—connections. Design in concrete. Design in timber Appendixes. Index.

Note. Although written by a specialist in civil engineering, this book is addressed to college students in non-civil branches of engineering, such as mechanical engineering and electrical engineering, in which an elementary knowledge of the design of structures is useful. It presents the subject in simpler way than would be appropriate to students preparing for careers in structural design. The applications described are in such fields as petroleum refinery construction, platforms for S field derricks, and electrical substations. Analysis and design procedures are both covered. The expository text includes numerous worked examples of problems in both analysis and design.

HETÉNYI, MIKLÓS IMRE

Beams on elastic foundation theory with applications in the fields of civil and mechanical engineering Ann Arbor The University of Michigan Press 1946 255 p illus. 26 cm $6 00 5519

Contents. General solution of the elastic line. Beams of unlimited length. Beams of finite length. Particular cases of loading on finite beams. Beams of variable flexural rigidity and variable modulus of foundation. Straight bars under simultaneous axial and transverse loading. Elastic stability of straight bars. Torsion of bars. Circular arches. Continuity in the foundation. Tables.

Note. This book is probably the most comprehensive treatment of the analysis of beams supported on elastic foundations. Although some theory and technique have been taken over from the older literature on the subject, the greater part of the material, including number of useful formulas, is original. Occasional practical applications are introduced into the text, but the emphasis is on theory

HETÉNYI, MIKLÓS IMRE, editor

Handbook of experimental stress analysis. New York John Wiley & Sons, Inc., 1950. 1,077 p illus 23 cm. $17 00 5520

Contents. Mechanical properties of materials, by C. W MacGregor Testing machines, by J Marin. Mechanical gages and extensometers, by L. H. Donnell and W T Savage. Optical methods of strain measurement, by J L. Mandbeck. Electrical-resistance gages and circuit theory by C. O. Dohrenwend and W R. Mehaffey. Electric-inductance gages, by B. F Langer. Electric-capacitance gages, by B. C. Carter and others. Motion measurements, by J. Ormondroyd and others. Strain rosettes, by J H. Meier. Working stresses, by C. R. Soderberg. Residual stresses, by O. J. Horger. Methods of crack detection, by C. Lipson. Interpretation of service fractures, by R. E. Peterson. Brittle models and brittle coatings, by M. Hetényi. Structural model analysis, by J. B. Wilbur and C. H. Norris. Analogies, by R. D Mindlin and M. G. Salvadori. Photoelasticity: Fundamentals and two-dimensional applications, by T. J. Dolan and W M. Murray Three-dimensional photoelasticity by D. C. Drucker X-ray analysis, by C. S. Barrett. Appendixes: Fundamentals of the theory of elasticity by S. P Timoshenko. Dimensional analysis, by J N Goodier. The precision of measurements, by M. Hetényi. Index.

Note. This ork is comprehensive handbook of information on all of the important techniques of experimental (in contrast to mathematical) stress analysis which are currently of interest to engineers. In the typical chapter, "essay" information on basic principles, uses, and limitations of the particular technique under discussion is combined with tabulated data, pertinent illustrations, and an extensive bibliography of related literature. Most of the authors are engineers associated ith manufacturing corporations or are professors of engineering in outstanding schools of technology The book is addressed primarily to graduate engineers.

HOFF, NICHOLAS JOHN

The analysis of structures, based on the minimal principles and the principle of virtual displacements. New York John Wiley & Sons, Inc., 1956 493 p. 24 cm. $9 50 5521

Contents (abridged) The principle of irtual displacements. The minimum of the total potential. The calculation of buckling loads. Complementary energy and least-work methods. Appendixes. Author index. Subject index.

Note. A graduate-level exposition of structural analysis. The author's main theses are that the theory of structures is logical and unified system and that all of the methods of analysis and design used by engineers are related. The book is organized in the four parts whose titles are given above. The chief part is the first one, in which the principle of virtual displacements is presented as powerful tool of structural analysis, and its applications to a variety of frameworks is illustrated. In this part, such well-known methods as the Hardy Cross moment distribution method are discussed and related to the main theory The author is Head of the Department of Aeronautical Engineering and Applied Mechanics of Polytechnic Institute of Brooklyn and many of the applications used for illustration relate to aircraft structures. An extensive, annotated bibliography is included. In addition to its use in organized courses, the book should be of interest to graduate engineers ith some experience in structural design ho wish to read comprehensive, modern presentation.

HOOL, GEORGE ALBERT, AND W S KINNE, editors

Steel and timber structures. Revised by R. R. Zipprodt and D M Griffith. Second edition revised and enlarged. New York McGraw Hill Book Company Inc., 1942 733 p. illus. 23 cm. $11 00 5522

Contents Buildings. Roof trusses. Short span steel bridges. Timber bridges and trestles. Steel tanks. Chimneys. Structural steel detailing. Fabrication of structural steel. Steel erection. Estimating steelwork. Materials. Appendixes. Index.

Civil Engineering

Structural Analysis

Note: A collection of data to aid engineers, construction men, draftsmen, and designers in the design and erection of all types of steel and timber structures.

HOOL, GEORGE ALBERT, AND W S KINNE, editors

Stresses in framed structures compiled by a staff of specialists. Revised by R. R. Zipprodt and George C. Ernst. Second edition. New York. McGraw Hill Book Company Inc., 1942 642 p. illus. 23 cm. $8.50. 5523

Contents: General theory. Roof trusses. Bridge trusses. Lateral trusses and portal bracing. Deflection of trusses, redundant members and secondary stresses. Statically indeterminate frames. Wind stresses in high buildings. Rectangular tower structures. Appendices. Index.

Note: A treatment for home-study classroom instruction, and general reference, of the theory of stresses in all types of framed structures and its application to the various parts of the structures.

HOOL, GEORGE ALBERT AND W S KINNE, editors

Structural members and connections, compiled by a staff of specialists editors-in-chief George A. Hool and W. S. Kinne. Revised by R. R. Zipprodt and F N Menefee. Second edition. New York McGraw Hill Book Company Inc., 1943 639 p. illus. 23 cm. $3.50. 5524

Contents: Section 1, General theory: Definitions, stress and deformation, simple and cantilever beams, deflection of beams, restrained and continuous beams, columns, bending and direct stress, unsymmetrical bending. Section 2, Design of steel and cast-iron members. Steel shapes and properties of sections, steel beams, multiple beam girders, [illegible], box girders, plate girders, bearing plates and [illegible] for beams and girders, steel tension members, cast-iron [illegible], steel columns, [illegible]. Section 3, [illegible] and [illegible] for steel members. Section 4, Design of wooden members. Wooden beams, wooden girders, wooden columns. Section 5, [illegible] and connections for wooden members. Section 6, Design of reinforced concrete members. Rectangular beams and one-way solid slabs, T beams and ribbed one-way slabs, beams and slabs reinforced for compression, slabs supported upon four edges, flat slab floor panels, members subject to direct axial compression, members subject to direct axial tension, members subject to bending and direct compression, [illegible]. Appendixes. General notation. Geometric properties of sections. Deflections of beams: elastic curve method, [illegible] method. Index.

Note: A text and reference book for students and practicing engineers, presenting treatment of the general theory pertaining to structural members, also their detailed design and the design of their connections with other members. It covers the design of steel and cast-iron members, spacers and connections, and design of reinforced concrete members, a practical treatment including a number of worked-out [illegible] problems.

LEE, GEORGE HAMOR

An introduction to experimental stress analysis. New York John Wiley & Sons, Inc., 1950. 319 p. illus. 23 cm. $6.00. 5525

Contents: An introduction to the theory of elasticity. Stress determinations from strain measurements. Structural [illegible]. Strain gages. The variable resistance wire strain gage. Photoelasticity—[illegible]. Photoelasticity—experimental procedure. Analogies. The brittle lacquer method. Miscellaneous methods in experimental stress analysis. Experimental considerations. Name index. Subject index.

Note: A survey of currently practiced methods without undue emphasis on any one method. The contents were developed from notes prepared by the author used in the course at the United States Naval Postgraduate School, and the book is intended for readers with previous education in engineering. Specific techniques and testing instruments are both described. In many instances, pictures of the instruments are included. Each of the chapters concludes with well-selected bibliography of the international literature.

MCKAIG THOMAS H.

Applied structural design of buildings. Second edition. New York F W Dodge Corporation, 1956. 442 p. illus. 27 cm. $17.50. 5526

Contents: General principles. Simple stresses and elastic theory. Moments. Steel in bending. Reinforced concrete in bending. Timber and other materials in bending. Columns. Foundations and walls. Connections. Complex structures. Office practice. Index.

Note: A reference book of design methods and data useful to architects [illegible] in the designing of structures. The author, [illegible] consulting engineer, has based it on the experience of his own firm. The main topics covered are listed above. Generally speaking, the chapters consist of presentations of short practical methods. In most instances, the method is described and its application to the solution of at least one problem is illustrated. Data useful in connection with it is supplied in adjacent tables. The first edition was issued privately in 1949 by the author. Various revisions were made in preparing this second edition, but the most noteworthy change is [illegible] much improved format.

MAUGH LAWRENCE CARNAHAN

Statically indeterminate structures. New York John Wiley & Sons Inc., 1946 338 p. illus. 23 cm. $6.00. 5527

Contents: Classification and description of statically indeterminate structures. Fundamental principles of structural mechanics. Continuous beams and frames with straight prismatic members. Building frames subjected to vertical loads. Continuous frames with joints having different lateral displacements. Continuous girders and frames with variable moment of inertia. Continuous trusses and bents. Elastic arches, rings, and frames with curved members. Flexible members. Special problems in statically indeterminate structures. Appendix. Index.

Note: Teaching material developed for use in senior and graduate engineering courses at the University of Michigan forms the basis of the work. Statically indeterminate structures are discussed and classified, and the fundamental principles of structural mechanics are explained. Emphasis is placed on solving problems by methods of successive approximation. Selected references to related literature and a group of problems for the student to solve are appended to each chapter. The author is Professor of Engineering at Michigan.

MORRIS CLYDE TUCKER, AND SAMUEL T CARPENTER

Structural frameworks. New York John Wiley & Sons, Inc., 1943 272 p. illus. 22 cm. $5.50 5528

Contents: Loads. Fireproof floors. Beams and girders. Deflections. Columns. Rigid frames under vertical loading. Wind bracing. Asymmetry. Radio and transmission towers. Industrial buildings. Welded design. Column bases and foundations. Index.

Note: A clear explanation of some of the more intricate problems that arise in the design of buildings and structural frameworks. Some of the problems are encountered when preliminary analysis does not allow for sufficient interaction of the many members of the structural frame which occur when the effects of deformations are not included in the analysis. Wherever possible the discussion is supplemented by detailed examples to show how the theory may be applied specifically. The authors indicate permissible simplifications in methods of calculation which are in accord with the elastic action of the structures and which give results of adequate accuracy.

MURNAGHAN FRANCIS DOMINIC

Finite deformation of an elastic solid. New York John Wiley & Sons, Inc., 1951 140 p. 24 cm. (Applied mathematics series, edited by I. S. Sokolnikoff) $6.25 5529

Contents: Vectors and matrices. The specification of strain. The connection between stress and strain. Isotropic elastic media. Nonisotropic elastic media. Simple shear and tension. Particular problems. Index.

Note: An important contribution to the literature of the theory of elasticity. In it, methods of analysis based largely on matrix algebra are provided for the computation of the small deformations that occur in solids under stress. These minute deformations are usually

ignored in conventional design, but they are important in connection with the design of highly stressed structural members, such as the rotor blades of gas turbines. In the final chapter matrix algebra is applied t the solution of problems involving the compression of the spherical shell, a circular tube and the torsion of a circular cylinder

NATIONAL LUMBER MANUFACTURERS ASSOCIATION

Wood structural design data. Third edition Volume 1 Washington, D C National Lumber Manufacturers Association, 1956 362 p illus 28 cm $4 00 5530

Contents. Introduction. Notations and symbols. Physical properties. Mechanical properties. Stress-grades and allowable stresses. Structural glued laminated lumber. Joint fastenings. Load duration—allowable stress relationships. Lumber terms. Abbreviations of lumber terms. Board measure table. Lumber quantity—cost table. Standard lumber sizes. Properties of sections, sawn lumber—glued laminated lumber Wood beams, design—general formulas—resisting moments—safe load tables, explanation—load tables, limited by deflection—load tables, determined by bending. Maximum spans for joists and rafters. Plank and laminated floors and roof decks. Wood columns, design—load tables. Stud walls. Wood trusses. References. Appendices Properties of sections, condensed table. Decimal equivalents. Sources of additional information.

Note A large volume containing extensive factual and tabular information relating to the design of typical wood structural members. The various tables are accompanied by text to assist the user in the interpretation and application of the data, which conform to the *National design specification for stress-grade lumber and its fastenings*, 1957 The new (third) edition takes account of improvements in efficient structural design in wood since the issuance of the previous edition, including the following: the timber connector system of wood construction the development of structural glued-laminated lumber and a simplified procedure for column design. A five-page supplement to Volume 1 has been issued entitled, *Working stresses for stress-grade lumber*

PARCEL, JOHN I, AND ROBERT B B MOORMAN

Analysis of statically indeterminate structures. New York John Wiley & Sons, Inc. 1955 571 p illus. 24 cm. $9 50 5531

Contents. Introduction. Deflections by the method of work. Deflections by special methods. General theory of statically indeterminate stresses. Special methods—selection of base system—elastic center—column analogy Special methods—slope deflection. Special methods—moment distribution. Continuous girders and trusses. The rigid frame. Secondary stresses. The elastic arch. Suspension bridges. Index.

Note There are many textbooks on statically indeterminate structures nevertheless, this new one merits inspection by anyone who is interested in structural design. It is painstakingly written with careful attention paid to basic definitions and theory detailed exposition of variety of useful methods of analysis, and numerous examples f problems such as will be encountered in practical design. Both authors have extensive experience in the teaching of structural analysis, and Professor Moorman is at present chairman of the Department of Civil Engineering of Syracuse University

PARKER, HARRY

Simplified design of roof trusses for architects and builders. Second edition. New York John Wiley & Sons Inc. 1953 278 p illus 20 cm. $4 75 5532

Contents. Part I, Principles of graphic statics Concurrent forces. Non-concurrent forces. Centroids—center of gravity Beams, shear and moment diagrams. Part II, Stresses in roof trusses. Types of roof trusses. Loads on roof trusses. Reactions Stresses in roof trusses. Miscellaneous roof trusses. Maximum stresses. Part III, Design of roof trusses. Timber trusses. Steel trusses. Part IV Timber connectors in roof trusses Timber connectors. Truss members in tension. Timber columns formulas. Design of truss joints. Trusses framed with timber connectors. Index

Note. A useful exposition of principles and practical design methods, with emphasis on the latter It is directed primarily to men in architecture and building who lack formal engineering education. However it is useful also to trained engineers as a review or practical manual. It is written in straightforward style and contains many helpful diagrams. Typical problems in design are described and solved as an integral part of the exposition. All of the data necessary for carrying out the calculation of the problems are provided in tables in the book itself The first edition was published in 1941 The book as considerably revised and expanded for this second edition in order to incorporate changes in allowable unit stresses and other advances in practice. The entire fourth section on the design of roof trusses in which timber connectors are used was added in this edition.

PARKER, HARRY

Simplified design of structural steel. Second edition. New York John Wiley & Sons, Inc, 1955 244 p illus. 20 cm. $5 75 5533

Contents Structural sections. Unit stresses. Reactions, moments and shear Bending stresses properties of sections. Design of beams. Floor framing. Riveted connections. Welded connections. Plate girders. Columns. Miscellaneous structural elements. Index.

Note A well-known text book designed for such readers as architects and builders who are interested in practical design rather than theory The common structural steel shapes are described, and their properties are tabulated in series of tables. Simple methods requiring only arithmetic and elementary algebra are then illustrated for the computation of shear bending moments, deflections, etc. The design of particular structural elements, such as floor frames, is explained in an expository text and in numerous worked examples. The first edition of the book was published in 1945. The organization and scope are unchanged in this second edition, but data have been added on new steel shapes. Shapes no longer produced have been eliminated. A number of new topics have been added, including the design of open web steel joists and the design of beams for long spans and light loads.

PARKER, HARRY

Simplified engineering for architects and builders. Second edition. New York John Wiley & Sons, Inc. 1947 245 p. illus. 20 cm. $4 75 5534

Contents Section I, Principles of mechanics: Direct stresses. Stresses with new names. Lengthening and shortening of bars. Moments. Reactions of beams. Shear and bending moments. Theory of bending and properties of sections. Section II, Timber construction. Section III, Steel construction. Section IV Reinforced concrete. Section V Roof trusses.

Note This useful work is intended to show architects, draftsmen, and builders how to design simple structural units, such as beams, columns, floors, and roof trusses. Although it contains few tables, it is a self-instruction text rather than handbook. Compared to the first edition (1938) the purpose and arrangement of the work are unchanged but there are rather extensive and important changes in unit stresses, and in the tables and problems.

PARKER, HARRY

Simplified mechanics and strength of materials. New York John Wiley & Sons, Inc., 1951 275 p. 20 cm. $5 50 5535

Contents Mechanics and strength of materials. Forces. Forces acting on bodies. Moments of forces. Stresses and deformations. Properties of sections. Shearing stresses in beams. Bending moments in beams. Continuous and restrained beams. Deflection of beams. Beams. Built-up beams of two materials. Column stresses, design of beams. Rivets and welds. Torsional stress and shafts. Stresses in pipes and tanks. Reinforced concrete. Retaining walls and dams. Index.

Note. The sixth of Professor Parker's "simplified" books. Like the others, the matter in this book is not so much simplified as it is brief and clear. The book's purpose is to give engineers, engineering students, architects and others who need an understanding of mechanics and strength of materials, working knowledge that can be put to practical use. The topics have been carefully selected, and the exposition contains numerous worked examples. The mathematics employed includes only arithmetic and algebra.

PERRY, C C, AND H R LISSNER

The strain gage primer New York McGraw Hill Book Company Inc. 1955 281 p. illus. 24 cm. $6 00 5536

Contents: An introduction to strain measurement. Bonded wire strain gage. Basic strain gage techniques. The Wheatstone bridge. Instrumentation. Scales and systems. Strain rosettes and stress gages. Known-grades of strain gages. Long-time strain gage installations. The use of strain gages with slip rings and switch contacts. Transducer applications of strain gages. Special problems, techniques, and equipment. Strain indication with brittle coatings. Appendix. Tables of strain gage characteristics and dimensions. Index.

Note: Truly a "primer" in the sense that it is introductory to the subject, the book is nevertheless a thorough manual of the practical use of strain gages. The basic principles of the strain gage and its accessory instruments are treated only briefly. On the other hand, its possibilities and limitations, applications, techniques of installing strain gages on a variety of devices and materials; the methods of reading or compensating for errors; and other aspects of interest to engineers who use strain gages are covered in full detail. Because brittle lacquers are often used in conjunction with strain gages to show stress pattern, a chapter on them is included. Literature references are supplied for each chapter.

PHILLIPS ARIS

Introduction to plasticity New York Ronald Press Company 1956 230 p. illus. 24 cm. $7.00. 5537

Contents: Introduction. The calculation of the collapse load. The moment-curvature diagram. Bending with axial force. Deflections. Curved bars. Stress-strain relations. Collapse under combined stresses. Beam buckling under combined stresses. Appendix. Problems. Index of names. Index of subjects.

Note: A new engineering college text in which plasticity in metals is presented from the standpoint of practical engineering design. The book could serve also as an introduction for practicing engineers, especially since plastic design of structures is gaining recognition as a system of design that may supersede at least in some fields, the established system of elastic design. In several of the chapters, there are concise discussions of the results of experiments designed to test theories, such as the theory of plastic collapse. Fairly extensive lists of references to the source literature of the subject, including the author's own papers, are included in the various chapters. Proofs of important theorems and formulas are supplied in the appendix. The author is Associate Professor of Civil Engineering in Yale University.

PRAGER, WILLIAM AND PHILIP G HODGE, JR.

Theory of perfectly plastic solids. New York John Wiley & Sons, Inc., 1951 264 p. 24 cm. (Applied mathematics series edited by I. S. Sokolnikoff) $7.50. 5538

Contents: Basic concepts. Trusses and beams. Torsion of cylindrical or prismatic bars. *Plane strain problems with axial symmetry—general theory—specific problems—contained plastic deformation—limit analysis.* Extremum principles. Author index. Subject index.

Note: An introduction for senior and graduate students of engineering and applied mathematics. Some previously unpublished material on limit analysis is included, along with the published contributions of such scientists as von Kármán, von Mises, Nadai, and Prandtl. The mathematical level is best described in the authors' own words, "The mathematical background expected from the reader is that necessary for advanced strength of materials or elementary theory of elasticity. The authors have attempted to refrain from indulging in mathematics for mathematics' sake. On the other hand they did not hesitate to use the mathematical tools and techniques best fitted for the problems under discussion."

REYNOLDS METALS COMPANY

Aluminum in modern architecture. Volume I, Buildings, by John Peter associate editor Edward A. Hamilton. Volume II, Engineering design and details, by Paul Weidlinger New York Reinhold Publishing Corporation, 1956. 2 v 23 cm. Vol. 1 $10.00 vol. 2 $17.50. 5538A

Contents: Volume I. Introduction. Aluminum in modern building. List of buildings by type—factories—offices—residences—schools—churches—general. Conversations with noted architects. Index. Volume II. Background to aluminum. Physical and mechanical properties. The production, fabrication and surface finishing of aluminum mill products and castings. Joints and connections. Potentials and limitations of aluminum as a structural material. Structural design. Architectural design and details. Aluminum piping, ductwork and insulation. Appendix. Index. Credits.

Note: The first of these two volumes is primarily a picture book of structures in which aluminum has been used as an important structural or decorative element. Buildings from most of the countries of the world are shown and the photographs are both dramatic and well reproduced. The second volume is an assembly of architectural and engineering information—primarily the latter—useful to architects and engineers in building design. It provides reliable data on the physical and mechanical properties of aluminum and aluminum alloys. It supplies design information on whole structures and on structural elements in which aluminum is the major material. This volume also is well illustrated. In view of the fact that it will be used for reference the index is very inadequate.

SHEDD THOMAS CLARK AND JAMISON VAWTER

Theory of simple structures. Second edition. New York John Wiley & Sons, Inc., 1941 505 p. illus. 23 cm. $6.00. 5539

Contents: Part I, Theory of simple structures: Introduction. Reactions. Shears and moments—fixed loads. Reactions, shears and moments—moving loads. Common framed structures. Stresses in trussed structures—fixed loads. Graphic statics. Stresses in trussed structures—moving loads. *Effect of lateral and longitudinal forces.* Part II, Introduction to statically indeterminate structures. Beams and frames. Trussed structures. Properties of a triangle and a parabola. Index.

Note: A simple but thorough discussion of the application of the fundamental laws of statics in structural analysis, as well as a treatment of the basic principles of the analysis of statically indeterminate structures. This latter is the feature of the second edition, and it is presented in the two chapters of Part II. Emphasis in this book is placed on the changes in shape of the loaded structure, and the calculation of the magnitude of these changes by the geometry of small angle changes along the axes of the members.

SOKOLNIKOFF I. S

Mathematical theory of elasticity Second edition. New York McGraw Hill Book Company Inc., 1956. 476 p. illus. 24 cm. $9.50 5540

Contents: Analysis of strain. Analysis of stress. Equations of elasticity. Extension, torsion, and flexure of beams. Two-dimensional elastostatic problems. *Three-dimensional problems. Variational methods.* Name index. Subject index.

Note: A standard, comprehensive work in which the property of substances—notably building materials—to recover their original shapes after deformation is treated analytically and from a unified point of view. It is regarded as a college textbook but is widely recognized also as an important contribution to engineering literature. The first edition was published in 1946. This edition is about 100 pages longer and contains very extensive problems and supplementation. Two of the three terminal chapters are entirely new and the other has been very extensively revised. Citations of recent literature have been added to the bibliographical footnotes and to the numerous short lists of collateral reading.

SUTHERLAND HALE, AND HARRY LAKE BOWMAN

Structural theory Fourth edition. New York John Wiley & Sons, Inc., 1950. 394 p. illus. 23 cm. $3.50 5541

Contents: Reactions and stresses. Graphic statics. Roof trusses. Truss and girder bridges. Long-span bridges. Lateral bracing and portals. Slope and deflection. Rigid frames. Wind stresses in tall building frames. Indeterminate trusses. Secondary stresses. Space frameworks. Index.

Note: A long-established introductory text for engineering college students. It is concerned with the design of trusses, rigid frames, and space frameworks and covers more difficult structures, such as the suspension bridge. There is strong emphasis on the use of graphic methods in the solution of problems. The scope and arrangement are unchanged from the preceding edition; but a fair amount of material has been added on such matters as the solutions of compound

trusses by means of the Williot-Mohr diagram, and the use of the theorem for virtual work in reaction and truss stress computations. The chapter on rigid frames has been considerably expanded.

TIMOSHENKO, STEPHEN

Theory of elastic stability New York McGraw Hill Book Company, Inc., 1936 518 p illus 23 cm. (Engineering Societies monographs, H. W Craver, consulting editor) $9 50 5542

Contents Bending of prismatic bars under the simultaneous action of axial and lateral loads. Buckling of centrally compressed bars. Experiments and design formulas. Buckling of compressed rings and curved bars. Lateral buckling of beams. Bending of thin plates. Buckling of thin plates. Bending of thin shells. Buckling of shells.

Note. Written for designers of metallic structures, such as bridges, ships, airships, aeroplanes, etc., and also for use in colleges in courses of theory of structures and design of aeroplanes. Gives complete discussion of such problems as buckling of struts, compressed members of trusses, buckling of curved bars, lateral buckling of I-beams, buckling of plates, webs of plate girders and of thin shells. In all cases not only is the theory developed, but also the application of this theory in design is shown and experiments verifying the theory are described.

TIMOSHENKO, STEPHEN, AND J N GOODIER

Theory of elasticity Second edition New York McGraw Hill Book Company, Inc., 1951 506 p illus. 24 cm. (Engineering Societies monographs Ralph H. Phelps, consulting editor) $10 50 5543

Contents Introduction. Plane stress and plane strain. Two-dimensional problems in rectangular coordinates. Two-dimensional problems in polar coordinates. The photoelastic method. Strain energy methods. Two-dimensional problems in curvilinear coordinates. Analysis of stress and strain in three dimensions. General theorems. Elementary problems of elasticity in three dimensions. Torsion of prismatical bars. Bending of prismatical bars. Axially symmetrical stress distribution in solid of revol tion. Thermal stress. The propagation of waves in elastic solid media. Appendix The application of finite difference equations in elasticity Author index. Subject index.

Note In this book the fundamentals of the theory of elasticity are presented, together with solutions of special problems and descriptions of approximate and experimental methods for solving elasticity problems. Because practical applications of the theory of elasticity are emphasized, consideration of matters of chiefly theoretical interest is omitted. Bibliographical references are given in footnotes for the benefit of those desiring to study special problems in more detail. The second edition is expanded by nearly 100 pages in comparison with the 1934 edition. The sections in the first edition dealing with the photoelastic method and thermal stress have been expanded and made into separate chapters presenting many methods and solutions not given in the original edition. An appendix has been added on the method of finite differences and its applications, including the relaxation method. New sections and paragraphs have been incorporated into other chapters.

TIMOSHENKO, STEPHEN

Theory of plates and shells. New York McGraw Hill Book Company Inc 1940 492 p illus 23 cm (Engineering Societies monographs H W Craver consulting editor) $9 00 5544

Contents Bending of long rectangular plates to cylindrical surface. Pure bending of plates. Symmetrical bending of circular plates. Small deflections of laterally loaded plates. Simply supported rectangular plates. Rectangular plates with various edge conditions. Plates of various shapes. Bending of plates under the combined action of lateral loads and forces in the middle plane of the plates. Large deflections of plates. Deformation of shells without bending. General theory of cylindrical shells. Shells having the form of surface of revolution and loaded symmetrically with respect to their axis.

Note. A complementary book to the author's *Theory of elasticity* It covers structural elements in hich one dimension is small in comparison with the other dimensions, in short, plates and shells. It is used both as a textbook and as treatise and reference book by graduate engineers.

TIMOSHENKO, STEPHEN, AND D H. YOUNG

Theory of structures. New York McGraw Hill Book Company, Inc., 1945 488 p. illus. 23 cm $8 00 5545

Contents: Elements of plane statics. Statically determinate plane trusses. Influence lines. Statically determinate space structures. General theories relating to elastic systems. Deflection of pin-jointed trusses. Statically indeterminate pin-jointed trusses. Beams and frames. Arches. Index.

Note A well-written textbook for engineering college students. The authors have taken special pains to demonstrate the relationships between mechanics and structural analysis. Problems for the student to solve are included.

VAN DEN BROEK, JOHN ABRAHAM

Elastic energy theory Second edition New York John Wiley and Sons, Inc., 1942 298 p illus 23 cm $6 50 5546

Contents Statically determinate versus statically indeterminate structures. Elastic energy Analysis of frames. Redundant frames. Analysis of beams. Redundant beams. Combined bending and direct stress. Combined bending and torsion. Elastic energy and deformations due to shear. Resilience. Elastic curves as influence lines. Theory of least work. Columns. Estimate of elastic energy theory. Appendixes. Problems. Index.

Note A study of the elastic energy method to determine the distribution of stresses in elastic materials subject to deformation. The book avoids the historic approach to the subject, except for the purpose of comparison, and simplifies the treatment of the subject. Statically indeterminate problems usually found in the design of bridges and buildings can be solved by the methods presented in the book. In addition, there are methods and problems in the solution of springs, large pipes, and airship and airplane frames.

VAN DEN BROEK, JOHN ABRAHAM

Theory of limit design. New York John Wiley & Sons, Inc., 1948 144 p. illus. 22 cm. $4 50 5547

Contents Physical properties of metals. Limit design of simple structures. Limit design of redundant beams. Limit design of frames. Connection details. Evaluation of limit design. References. Problems. Index.

Note Limit design is method of structural analysis hich aims at ascertaining the permissible sal deformations in given structure, or in establishing the limits ithin which failure is practically certain not to occur In this compact volume, the author has drawn upon his own research and experience to outline the procedure of such method and its underlying theory Particular attention is given to the ductile characteristics of metals, and numerous graphical representations of the stress-strain relationship of various metals and structural members are included.

VAWTER, JAMISON, AND JAMES G CLARK

Elementary theory and design of flexural members. New York John Wiley & Sons, Inc 1950 215 p illus. 23 cm. $5.50. 5548

Contents Pure bending in homogeneous, symmetrical sections. Bending in nonhomogeneous, symmetrical beams. Elementary design of steel beams and girders. Elementary design of steel columns with bending. Elementary design of reinforced concrete beams and columns. Bending in unsymmetrical sections. Bending in special beams including those ith thin ebs. Appendix. Illustrative design of floor in timber Index.

Note An engineering college textbook intended for use in intermediate courses offered to students who have had basic course in strength of materials. In effect, it is first book in practical design and as such is of potential interest to architects, practical builders, etc., who need an introduction or refresher on the engineering aspects of elementary structural design. The authors are Professors of Civil Engineering in the University of Illinois.

WANG, CHI TEH

Applied elasticity New York McGraw Hill Book Company Inc. 1953 357 p. illus. 24 cm. $8 50. 5549

Contents: Analysis of stress. Analysis of strain. Stress-strain relations and the general equations of elasticity. Plane-stress and plane-strain problems. Torsion of variously-shaped bars. Finite-difference approximations and the relaxation method. Energy principles and variational methods. Solution by means of complex variables. Bending and compression of bars—elastic stability. Numerical methods in the determination of buckling loads. Bending and buckling of thin plates. Theory of thin shells and curved plates. Index.

Note: The book was developed from lectures given over a period of years to graduate engineering students at New York University. Elasticity is presented from the viewpoint of structural design engineers already at work in their profession. The book is an introduction to the subject and at the same time an exposition of methods applicable in practical design. The treatment is primarily analytical and mathematical; however, the reader is not assumed to have knowledge of mathematics beyond introductory calculus. More advanced mathematics is developed in the book as needed. Full accounts are included of applicable approximation techniques and numerical methods. The book is of particular interest to engineers who are concerned with the analysis of airplane structures.

WANG, CHU KIA

Statically indeterminate structures. New York. McGraw-Hill Book Company Inc. 1953 424 p. illus. 23 cm. $7.50 5550

Contents: General introduction. Deflection of statically determinate beams and frames. Deflection of statically determinate trusses. Analysis of statically indeterminate beams and frames by the method of consistent deformation. Analysis of statically indeterminate trusses by the method of consistent deformation. The three-moment equation. The slope-deflection method. The moment-distribution method. The method of column analogy. Analysis of fixed arches. Secondary stresses in trusses with rigid joints. Composite structures. Answers to exercises. Index.

Note: An engineering college textbook in which extensive use is made of both solved problems and problems for the student to solve. Typical problems in analysis for which solutions are presented in detail are a feature of practically every chapter. There are 332 figures in addition to unnumbered figures included in the 131 exercises for the student. All of the standard methods of analysis of this type of structure are covered, as the chapter titles show. The author is a member of the faculty of the School of Architecture of the University of Illinois.

WESTERGAARD, HAROLD MALCOLM

Theory of elasticity and plasticity. New York John Wiley and Sons, Inc., for Harvard University Press, 1952 176 p. illus. 22 cm. (Harvard monographs in applied science. No. 3) $5.00. 5551

Contents: Scope. Historical notes. Stress. Strain. Hooke's law, the basic equations of elasticity, and the simplest possible laws of plasticity. Stress potential and applications to hollow cylinders and spheres, tensile bars, and thermal stresses. Galerkin vector, twinned gradient, and applications including effects of single forces. Index of authors. Index of subjects.

Note: The theory of elasticity (with some reference to plasticity) is presented very concisely and on a fairly advanced level in this book. Considerable attention is given to the historical aspects, not only in the chapter, "Historical notes," but to some extent in other chapters also. The author himself is responsible for many advances in the application of mathematics to the solution of practical engineering problems involving elasticity and his book is the essence of lectures which he gave for many years at Harvard University, where he was until his death Gordon McKay Professor of Civil Engineering.

WILBUR, JOHN BENSON AND CHARLES HEAD NORRIS

Elementary structural analysis. New York McGraw Hill Book Company Inc., 1948 523 p. illus. 23 cm. $7.50 5552

Contents: Introduction. Reactions. Shear and bending moment. Trusses. Graphic statics. Influence lines. Bridge and roof trusses. Long-span structures. Three-dimensional frameworks. Gravel structures. Cables. Approximate analysis of statically indeterminate structures. Deflections of structures. Stress analysis of indeterminate structures. Influence lines for statically indeterminate structures. Other structures. Model analysis of structures. Model methods of stress analysis. Other uses of structural models. Index.

Note: In this text for undergraduate civil engineering students the emphasis is placed on methods of stress analysis, and only brief mention is made of the principles of design. Throughout the book the illustrative material is drawn entirely from civil engineering structures, but the methods discussed and principles involved are applicable to structures [illegible] [illegible] fall within the scope of other branches of engineering. In spite of its predominantly textual nature, the volume will also be of value as a reference tool for practicing engineers. The authors are members of the faculty of Massachusetts Institute of Technology.

WILLIAMS CLIFFORD DAVID

Analysis of statically indeterminate structures. Third edition. Scranton, Pa. International Textbook Company 1951 395 p. illus. 21 cm. $6.75 5552A

Contents: Slope and deflection of beams. Slope and deflection of trusses. Beams. Single-span frames and arches. Slope deflection. Moment distribution. Continuous and redundant trusses. Secondary stresses in trusses. Columns. Column analogy. Multiple-span rigid frames. Index.

Note: Although the subject of indeterminate structures is ordinarily of graduate level, this book has been written for undergraduate engineering students. It stresses the application and simplicity of basic principles, and by means of many carefully chosen problems attempts to develop in the student an independent analytical ability. Completed course-work in integral calculus, applied mechanics, and the stress analysis of determinate structures are prerequisites. The chapter on column analogy describes a computation arrangement useful in analyzing many types of indeterminate structures. The second edition was published in 1946. The addition of the chapter on multiple-span rigid frames is the most important change in the third edition.

WILLIAMS CLIFFORD DAVID, AND ERNEST C HARRIS

Structural design in metals. New York The Ronald Press Company, 1949 596 p. illus. 24 cm. 5553

Contents: Introduction. Rivets, bolts and pins. Welding. Selection of sections. Connections. Plate girders. Trusses. Bearings. Light gage structural members. Fatigue of structural members. The rigid frame. Appendices. Index.

Note: An engineering college textbook which has several interesting features. Equal attention is given to welding and to riveting as techniques for the joining of structural metals. The structural aluminum alloys are considered along with steel. The method of exposition is to explain the design of structural elements and details rather than complete structures, thus enabling the student to acquire knowledge which is applicable to all types of structures from roof trusses to frames for airplanes. The appendix contains useful standard information and specifications. A second edition was published in 1957 653 p. $8.00

BUILDING

ACKERMAN ADOLPH JOHN AND CHARLES H. LOCHER

Construction planning and plant. New York. McGraw Hill Book Company Inc. 1940 381 p. illus. 23 cm. $6.00 5554

Contents (abridged): General problems. Preliminary planning. Preparatory work. Construction stages. Programming the job. Selection of equipment and small tools. Measuring equipment performance. Pile-driving and extracting equipment. Pumping and unwatering equipment. Excavating equipment. Transporting equipment. Compressed-air systems. Foundations. Cutoffs, pile foundations, and caissons. Cement handling. Concrete placing and forms. Hoisting and conveying equipment. Canals, tunnels and penstocks. Electric power and equipment. Human relations.

Note: A manual for contractors, engineers, and all others interested in the planning, control, and execution of large construction jobs, with practical methods and details from actual experience. Shows how to plan and manage jobs and gives descriptions, comparisons, and data for construction machinery per-

trusses by means of the Williot Mohr diagram, and the use of the theorem for virtual work in reaction and truss stress computations. The chapter on rigid frames has been considerably expanded.

TIMOSHENKO, STEPHEN

Theory of elastic stability New York McGraw Hill Book Company, Inc., 1936 518 p illus. 23 cm. (Engineering Societies monographs, H. W Craver, consulting editor) $9 50 5542

Contents Bending of prismatic bars under the simultaneous action of axial and lateral loads. Buckling of centrally compressed bars. Experiments and design formulas. Buckling of compressed rings and curved bars. Lateral buckling of beams. Bending of thin plates. Buckling of thin plates. Bending of thin shells. Buckling of shells.

Note Written for designers of metallic structures, such as bridges, ships, airships, aeroplanes, etc., and also for use in colleges in courses of theory of structures and design of aeroplanes. Gives a complete discussion of such problems as buckling of struts, compressed members of trusses, buckling of curved bars, lateral buckling of I-beams, buckling of plates, webs of plate girders and of thin shells. In all cases not only is the theory developed, but also the application of this theory in design is shown and experiments verifying the theory are described.

TIMOSHENKO, STEPHEN, AND J N GOODIER

Theory of elasticity Second edition New York McGraw Hill Book Company, Inc, 1951 506 p illus. 24 cm. (Engineering Societies monographs, Ralph H. Phelps, consulting editor) $10 50 5543

Contents Introduction. Plane stress and plane strain. Two-dimensional problems in rectangular coordinates. Two-dimensional problems in polar coordinates. The photoelastic method. Strain energy methods. Two-dimensional problems in curvilinear coordinates. Analysis of stress and strain in three dimensions. General theorems. Elementary problems of elasticity in three dimensions. Torsion of prismatical bars. Bending of prismatical bars. Axially symmetrical stress distribution in solid of revolution. Thermal stress. The propagation of waves in elastic solid media. Appendix The application of finite difference equations in elasticity Author index. Subject index.

Note. In this book the fundamentals of the theory of elasticity are presented, together ith solutions of special problems and descriptions of approximate and experimental methods for solving elasticity problems. Because practical applications of the theory of elasticity are emphasized, consideration of matters of chiefly theoretical interest is omitted. Bibliographical references are given in footnotes for the benefit of those desiring to study special problems in more detail. The second edition is expanded by nearly 100 pages in comparison ith the 1934 edition. The sections in the first edition dealing with the photoelastic method and thermal stress have been expanded and made into separat chapters presenting many methods and solutions not given in the original edition. An appendix has been added on the method of finite differences and its applications, including the relaxation method. New sections and paragraphs have been incorporated into other chapters.

TIMOSHENKO, STEPHEN

Theory of plates and shells. New York McGraw Hill Book Company Inc., 1940 492 p illus 23 cm (Engineering Societies monographs H W Craver consulting editor) $9 00 5544

Contents Bending of long rectangular plates to cylindrical surface. Pure bending of plates. Symmetrical bending of circular plates. Small deflections of laterally loaded plates. Simply supported rectangular plates. Rectangular plates ith various edge conditions. Plates of various shapes. Bending of plates under the combined action of lateral loads and forces in the middle plane of the plates. Large deflections of plates. Deformation of shells without bending. General theory of cylindrical shells. Shells having the form of surface of revolution and loaded symmetrically with respect to their axis.

Note A complementary book to the author's *Theory of elasticity* It covers structural elements in which one dimension is small in comparison ith the other dimensions, in short, plates and shells. It is used both as textbook and as treatise and reference book by graduate engineers.

TIMOSHENKO, STEPHEN, AND D H. YOUNG

Theory of structures New York McGraw Hill Book Company, Inc., 1945 488 p. illus. 23 cm. $8 00 5545

Contents Elements of plane statics. Statically determinate plane trusses. Influence lines. Statically determinate space structures. General theories relating to elastic systems. Deflection on pin-jointed trusses. Statically indeterminate pin-jointed trusses. Beams and frames. Arches. Index.

Note. A well- ritten textbook for engineering college students. The authors have taken special pains to demonstrate the relationships between mechanics and structural analysis. Problems for the student to sol are included.

VAN DEN BROEK, JOHN ABRAHAM

Elastic energy theory Second edition. New York John Wiley and Sons, Inc., 1942 298 p illus. 23 cm. $6 50 5546

Contents Statically determinate versus statically indeterminate structures. Elastic energy Analysis of frames. Redundant frames. Analysis of beams. Redundant beams. Combined bending and direct stress. Combined bending and torsion. Elastic energy and deformations due to shear. Resilience. Elastic curves as influence lines. Theory of least work. Columns. Estimate of elastic energy theory Appendices. Problems. Index.

Note A study of the elastic energy method to determine the distribution of stresses in elastic materials subject to deformation. The book avoids the historic approach to the subject, except for the purpose of comparison, and simplifies the treatment of the subject. Statically indeterminate problems usually found in the design of bridges and buildings can be solved by the methods presented in the book. In addition, there are methods and problems in the solution of springs, large pipes, and airship and airplane frames.

VAN DEN BROEK, JOHN ABRAHAM

Theory of limit design New York John Wiley & Sons, Inc., 1948 144 p. illus. 22 cm. $4.50 5547

Content Physical properties of metals. Limit design of simple structures. Limit design of redundant beams. Limit design of trusses. Connection details. Evaluation of limit design. References. Problems. Index.

Note. Limit design is method of structural analysis hich aims at ascertaining the permissible safe deformations in a given structure, or in establishing the limits within which failure is practically certain not to occur. In this compact volume, the author has drawn upon his ow research and experience to outline the procedures of such a method and its underlying theory Particular attention is given to the ductile characteristics of metals, and numerous graphical representations of the stress-strain relationship of various metals and structural members are included.

VAWTER, JAMISON, AND JAMES G CLARK

Elementary theory and design of flexural members. New York John Wiley & Sons, Inc., 1950 215 p. illus 23 cm. $5.50. 5548

Contents Pure bending in homogeneous, symmetrical sections. Bending in nonhomogeneous, symmetrical beams. Elementary design of steel beams and girders. Elementary design of steel columns with bending. Elementary design of reinforced concrete beams and columns. Bending in unsymmetrical sections. Bending in special beams including those ith thin webs. Appendix: Illustrative design of a floor in timber Index.

Note. An engineering college textbook intended for use in intermediat courses offered to students who have had basic course in strength of materials. In effect, it is first book in practical design and as such is of potential interest to architects, practical builders, etc., who need an introduction or refresher on the engineering aspects of elementary structural design. The authors are Professors of Civil Engineering in the University of Illinois.

WANG, CHI TEH

Applied elasticity New York McGraw Hill Book Company Inc. 1953 357 p. illus. 24 cm. $8.50 5549

Civil Engineering

Contents: Analysis of stress. Analysis of strain. Stress-strain relations and the general equations of elasticity. Plane-stress and plane-strain problems. Torsion of variously-shaped bars. Plane-deformation problems. Tension of [illegible] and the relaxation method. Energy principles [illegible] approximations and the relaxation method. Solution by means of complex [illegible] and variational methods. Solution by means of [illegible]. Bending and compression of bars—elastic stability. [illegible] methods in the determination of buckling loads. Bending and buckling of thin plates. Theory of thin shells and curved [illegible]. Index.

Note: This book was developed from lectures given over a period of years to graduate engineering students at New York University. [illegible] is presented from the viewpoint of structural design engineers [illegible] at work in their profession. The book is an introductory [illegible] to the subject and at the same time an exposition of methods [illegible] applicable in practical design. The treatment is primarily [illegible] and mathematical, however, the reader is not assumed to have knowledge of mathematics beyond introductory calculus. More advanced mathematics is developed in the book as needed. Full accounts are included of applicable approximation techniques and numerical methods. The book is of particular interest to those who are concerned with the analysis of airplane structures.

WANG, CHU-KIA

Statically indeterminate structures. New York McGraw Hill Book Company Inc., 1953. 424 p. illus. 23 cm. $7.50 5550

Contents: General introduction. Deflection of statically determinate beams and frames. Deflection of statically determinate trusses. Analysis of statically indeterminate beams and frames by the method of consistent deformation. Analysis of statically indeterminate trusses by the method of consistent deformation. The [illegible] method. The moment-distribution method. The method of column analogy. Analysis of [illegible] with rigid joints. Combined action. Secondary stresses in trusses with rigid joints. [illegible] structures. Answers to problems. Index.

Note: An engineering college textbook in which extensive use is made of both solved problems and problems for which solutions are provided. Typical problems in analysis for which solutions are [illegible] in detail are features of practically every chapter. There are 132 figures in addition to [illegible] figures included in the [illegible] problems for the student. All of the standard methods of analysis are covered, as the chapter titles [illegible] of the type of structure are covered. [illegible]. The author is a member of the faculty of the School of Architecture of the University of Illinois.

WESTERGAARD HAROLD MALCOLM

Theory of elasticity and plasticity New York. John Wiley and Sons, Inc., for Harvard University Press, 1952 176 p. illus. 22 cm. (Harvard monographs in applied science. No. 3) $5.00. 5551

Contents: Scope. Historical notes. Stress. Strain. Hooke's law. The basic equations of elasticity and the simplest possible laws of plasticity. Stress potential and applications to hollow cylinders and spheres, tensile forces, and thermal stresses. Galerkin vector, twinned gradient, and applications including effects of a single force. Index of authors. Index of subjects.

Note: The theory of elasticity (with some references to plasticity) is presented very concisely and on a fairly advanced level in this book. Considerable attention is given to the historical aspects, not only in the chapter, Historical notes, but to some extent in other chapters also. The author himself is responsible for many advances in the application of mathematics to the solution of practical engineering problems involving elasticity, and his book is the summary of lectures which he gave for many years at Harvard University where he was until his death Gordon McKay Professor of Civil Engineering.

WILBUR, JOHN BENSON AND CHARLES HEAD NORRIS

Elementary structural analysis. New York McGraw Hill Book Company Inc., 1948. 523 p. illus. 23 cm. $7.50. 5552

Contents: Introduction. Reactions. Shear and bending moment. Trusses. Graphic statics. Influence lines. Bridge and roof trusses. Long-span structures. Three-dimensional frameworks. Gravity structures. Cables. Approximate analysis of statically indeterminate structures. Deflections of structures. Stress analysis of indeterminate structures. Influence lines for statically indeterminate structures. Other structures. Model analysis of structures. Model methods of stress analysis. Other uses of structural models. Index.

Note: In this text for undergraduate civil engineering students the emphasis is placed on methods of stress analysis, and only brief mention is made of the principles of design. Throughout the book the illustrative material is drawn from civil engineering structures, but the methods discussed and principles involved are applicable to structures whose design falls within the scope of other branches of engineering. In spite of its predominantly textual nature, the volume will also be of value as a reference tool for practicing engineers. The authors are members of the faculty of Massachusetts Institute of Technology.

WILLIAMS CLIFFORD DAVID

Analysis of statically indeterminate structures. Third edition. Scranton Pa. International Textbook Company 1951 395 p. illus. 21 cm $6.75 5552A

Contents: Slope and deflection of beams. Slope and deflection of trusses. Beams. Long-span frames and arches. Slope deflection. [illegible]. Moment distribution. Continuous and redundant trusses. Secondary stresses in trusses. Columns. Column analogy. Multiple-span rigid frames. Index.

Note: Although the subject of indeterminate structures is ordinarily of graduate level, this book has been written for undergraduate engineering students. It stresses the application and simplicity of basic principles, and by means of many carefully chosen problems attempts to develop in the student an independent analytical ability. Completed course-work in integral calculus, applied mechanics, and the stress analysis of determinate structures are prerequisites. The chapter on column analogy describes a [illegible] method useful in analyzing many types of indeterminate structures. The second edition was published in 1946. The addition of the chapter on multiple-span rigid frames is the most important change in the third edition.

WILLIAMS CLIFFORD DAVID AND ERNEST C HARRIS

Structural design in metals. New York The Ronald Press Company 1949 596 p. illus. 24 cm. 5553

Contents: Introduction. Rivets, bolts and pins. Welding. Selection of sections. Connections. Plate girders. Trusses. Bearings. Light gage structural members. Fatigue of structural members. The rigid frame. Appendices. Index.

Note: An engineering college textbook which has several interesting features. Equal attention is given to welding and to riveting as [illegible]. The structural aluminum techniques for the joining of structural metals. The structural aluminum alloys are considered along with steel. The method of presentation is to explain the design of structural elements and details rather than complete structures, thus enabling the student to acquire knowledge which is applicable to all types of structures from roof trusses to frames for airplanes. ACKERMAN ADOLPH JOHN AND CHARLES H. LOCHER

Construction planning and plant. New York McGraw Hill Book Company Inc., 1940. 381 p. illus. 23 cm. $6.00. 5554

Contents (abridged): General problems. Preliminary planning. Preparatory work. Construction stages. Programming the job. Selection of equipment and small tools. Measuring equipment performance. Pile-driving and extracting equipment. Pumping and unwatering equipment. Excavating equipment. Transporting equipment. Compressed-air systems. Foundations. Caissons, pile foundations, and cofferdams. Cement handling. Concrete placing and forms. Hoisting and conveying equipment. Canals, tunnels and penstocks. Electric power and equipment. Human relations.

Note: A manual for contractors, engineers, and all others interested in the planning, control, and execution of large construction jobs, with practical methods and details from actual experience. Shows how to plan and manage jobs and gives descriptions, comparisons, and data for construction machinery [illegible]

ticularly heavy types, to aid in efficient planning and operation of construction plants. Based on a series of articles that appeared in *Construction methods*.

AMERICAN INSTITUTE OF STEEL CONSTRUCTION

Steel construction, a manual for architects, engineers and fabricators of buildings and other steel structures. Fifth edition New York American Institute of Steel Construction, 1946 432 p illus 23 cm. 5555

Contents (abridged) Part I Rolled steel structural shapes. Rolling mill practice. Miscellaneous data for designing and estimating. Part II, Estimating and detailing information Detailing practice. Standard beam connections. Separators, tie rods, and anchors. Field rivet and erection clearances. Pipe railing details. Rivet dimensions, weights, etc. Screw threads. Bolt and nut dimensions, weights, etc. Part III, Allowable loads by A. I. S. C. specification. Part IV Standard specifications and codes: American Institute of Steel Construction. American Institute of Bolt, Nut and Rivet Manufacturers. American Society for Testing Materials. American Welding Society United States Department of Commerce. Part V Miscellaneous data and mathematical tables. Index.

Note A widely used designers' and draftsman's handbook. Most of the changes in this edition had their origin in revised specifications and in changes in rolled shapes now being manufactured. A sixth edition was published in 1957 $3.50.

ANDERSON, L O, AND O C HEYER

Wood frame house construction. Prepared by the Forest Products Laboratory, U S Forest Service. Washington, D C. Government Printing Office 1955 235 p illus. 23 cm. (United States. Department of Agriculture Agriculture handbook no 73) $0 65 5556

Contents. Introduction. Location and excavation. Concrete work. Foundation walls and piers. Concrete floor slabs on ground. Floor framing. Wall framing. Ceiling and roof framing. Wall sheathing. Roof sheathing. Exterior trim and millwork. Roof coverings. Exterior frames, windows, and doors. Exterior siding and stucco. Framing details for plumbing. Framing details for heating systems. Wiring. Insulation. Ventilation. Interior-wall and ceiling finish. Floor coverings Interior doors, frames, and trim. Millwork. Stairs. Sheet-metal work. Porches and garages Chimneys and fireplaces. Drives, walks, and basement floors. Painting and finishing. Protection against decay and termites. Protection against fire. Methods of reducing building costs. Protection and care of material on the building site. Maintenance and repair Literature cited. Glossary of housing terms. Index.

Note. The purpose of the publication is to "present sound principles for wood-frame house construction and suggestions for selecting suitable materials in a manner that will greatly assist in the construction of a good house even by those without previous construction experience. It sets forth what are considered by the Forest Products Laboratory to be acceptable practices in assembling and arranging the parts of a well-designed frame house Construction details are given in a series of drawings. All construction requirements, as well as species and grades of lumber specified, conform as nearly as practicable to Federal Housing Administration minimum property requirements. Planning and designing are not covered. In addition to its use by amateur builders, the book is also suitable for use as a teaching text for apprentice carpenters and as a guide to judging quality in frame house construction.

ARCHITECTURAL RECORD

Architectural engineering new concepts new methods, new materials new applications. New York, F W Dodge Corporation 1955 494 [illegible] cm. $11 50 5557

[illegible] Structural elements [illegible] Building shell Structural frame, [illegible] with the other division. Section 2 Environmental con[illegible] both as textbook [illegible]ing—panel heating—air conditioning—[illegible] Lighting. Acoustics. Section 3. Vertical transportation and materials handling. Section 4 Site planning: Drainage. Foundations. Roads and parking. Section 5, Materials Concrete. Wood. Wood protection. Glass. Plastics. Flooring. Section 6, Special problems. Structural safety Fire and explosion protection. Planning for atomic energy Index.

Note. Approximately 100 articles published during the past nine years in *Architectural record* have been collected in this volume. Both text and illustrations have been reprinted. The range of topics is indeed wide, from a discussion of experiences with unpainted wood siding to uses of prestressed concrete. The title Architectural engineering is inappropriate, for there is no resemblance to a systematic treatise. Rather the book provides within one set of covers a series of informative, expertly written but separate accounts of recent developments in building materials and techniques, together with a few articles on older techniques, such as are employed in the drainage of building sites. The index is a good one that includes architects' and builders' names as well as topics.

ARCHITECTURAL RECORD

Time-saver standards a manual of essential architectural data for architects, engineers, designers, builders, draftsmen and other technicians. Third edition. New York F W Dodge Corporation, 1954 888 p. illus. 29 cm. $12.50 5558

Contents (abridged) Office practice—drafting standards, symbols, fundamental data. Structural design and construction methods. Design elements—residential—non-residential. Recreation, site planning, landscaping. Building materials and equipment.

Note A standard reference book, well known in architectural and technical libraries, including the office libraries of architects and draftsmen. Each of the sections named in the above table of contents has a number of subsections devoted to specific topics of which "Windows—wood, Retail shops—interior displays, and "Office lighting" will serve as examples. The typical sub-section is a concise essay containing both narrative description for background and tabular and graphical presentations of data for use in design. Selected literature references are usually included. In this edition, the book has been reorganized and a considerable range of material added. Room was made for the new material by deleting certain material that appeared in preceding editions. Much of the material was reprinted from *Architectural record* and other publications.

BLAKE MARION ELIZABETH

Ancient Roman construction in Italy from the prehistoric period to Augustus a chronological study based in part upon the material accumulated by the late Dr Esther Boise Van Deman Washington D C Carnegie Institution of Washington 1947 421 p. illus. 29 cm. (Carnegie Institution of Washington. Publication 570) $10 00 5559

Contents List of plates. Selected bibliography and abbreviations. Types of evidence. Roman building materials. Stone walls in Italy Squared-stone construction in Rome and vicinity Arch and vault construction in cut-stone work. Opus incertum to opus reticulatum. Sun-dried and semi-baked bricks. Brick and tile construction. Mortar and similar mixtures. Concrete. Indexes Sites other than Rome. Rome. Types of evidence. Materials used in building. Subjects.

Note A carefully-documented, scholarly study Although it is of primary interest to archaeologists, it is also valuable to students of the history of building and engineering. Detailed and precise information is presented on both building materials and methods of building.

BURBANK NELSON L

House carpentry and joinery Fifth edition. New York *Simmons-Boardman* Publishing Corporation 1952 219 p. illus 29 cm o p. 5560

Content Tools and equipment. House plans Excavations. Foundation forms. Foundations. Sills Girders. Floor joists. Sub flooring. Outside framed walls. Inside framed walls Plumbing framed work. Sheathing walls. Ceiling joists. Roof framing Roof sheathing. Cornices. Roofing. Porch and bay framing Exterior wall covering. Interior wall covering. Stairs. Interior trim Windows Doors. Hardware. Closets, shelving and built-in equipment Finished flooring.

Garage doors. Insulation. Finishing. Glossary. Twelve principles for construction. Index.

Note. A revision of the book formerly entitled Carpentry and joinery work. In its earlier editions [illegible] was designed primarily as trade school textbook. In the present edition the emphasis has been changed somewhat in favor of the layman and amateur builder [illegible] much of practical information about building. Passages and sections addressed directly to students and apprentice carpenters —for instance, the chapter on tool usage—have been omitted, and the book has been converted to [illegible] compendium of [illegible] information on the structural details of [illegible] houses, especially houses [illegible] modern homes. There is [illegible] wide variety of illustrations. A new edition [illegible] planned for 1958.

BURBANK, NELSON L.

House construction details. Fourth revised edition. New York Simmons-Boardman Publishing Corporation, 1954 395 p. illus. 28 cm. $4.95. 5561

Contents: Floor plans—sets of house plans. Excavations—foundations [illegible]—foundations. Sills—girders—posts—sub-flooring. Outside wall construction. Inside walls—wall sheathing—[illegible]. [illegible] roof construction—bay construction—roofing. Cornices and porches. Exterior wall covering. Interior wall covering—interior trim. Stair construction. Windows. Doors. Hardware. Closets—shelves—built-in equipment. Finished flooring. Chimneys and fireplaces. Scaffolds and [illegible]. Garages. Insulation. Heating—air conditioning. Painting and finishing. Modern building materials. Prefabrication. Farm buildings—equipment. Better detail [illegible]. Index.

Note: Numerous [illegible] drawings, diagrams and photographs [illegible] illustrate typical methods, typical equipment, architectural and structural details, and construction techniques are the main features of this practical manual for builders. Many of the illustrations are reproduced from the periodical *American builder.* Most are accompanied by legends which carry [illegible] considerable part of the exposition. The reading text [illegible] concise and [illegible] devoted to explanations of principles of building and descriptions of classes of equipment. The book [illegible] used as [illegible] guide and source of ideas in the construction of new single-family houses, in the alteration of [illegible] [illegible] remodeled plans, and in house remodeling. The third edition was published in 1952. Much material has been carried over from it to the fourth edition. However, some material has been added, particularly in the illustrations.

BURKE, ARTHUR E., AND OTHERS

Architectural and building trades dictionary by Arthur E. Burke, J Ralph Dalzell, and Gilbert Townsend. Edited by Pearl Jenison. Chicago American Technical Society 1955 377 p. illus. 22 cm. new enlarged edition. $6.50. 5562

Note. An illustrated dictionary for architects, builders, carpenters, and contractors. Words and terms are defined briefly and clearly [illegible] pronunciation [illegible] indicated for selected words. The 346 pages of the dictionary proper contain 11 detailed illustrative figures, some of them full-page size, as for example those for [illegible], chimney, [illegible], [illegible] [illegible]. A useful book for those needing practical definitions of words, terms, and phrases in the building trades.

COY PAUL H., AND LEO M LEGATSKI

Unistrut space-frame system. Ann Arbor University of Michigan Press, 1955 2 vols. in 1. 75 p. illus. 29 cm. $7.50. 5563

Contents: Research organization. Project history. Testing program. Laboratory tests. Gravity-load field tests. Lateral-load field tests. Analysis of field-test findings. General conclusions. Postscript.

Note: This work is the detailed report of "the technical aspects of [illegible] program of research and experimentation aimed at the development of [illegible] demountable space-frame system of building construction using Unistrut framing members. Unistrut framing members are [illegible] product of the Unistrut Corporation of Wayne, Michigan. The research was conducted as [illegible] project of the Engineering Research Institute of the University of Michigan. It involved the design and erection of test structures, testing of the structures, and the development of some new framing members and connections. One volume of the report describes the project, its techniques, and results in [illegible] text. The other volume consists of graphical presentations of the results of tests, photographs of structures and other illustrations.

CRANE, THEODORE

Architectural construction the choice of structural design. Second edition. New York John Wiley & Sons, Inc., 1956 433 p. illus. 25 cm. $10.00 5564

Contents. Building codes and design standards. Choosing the framing material. Planning the framing of [illegible] building. Choosing the structural floor system. Choosing the structural roof system. Wide-span designs. Choosing the wall assembly. Masonry walls. Choosing the type of foundation. *Index.*

Note. The subtitle of this book furnishes the clue to its purpose. Addressed to advanced students of architecture and architectural engineering, practicing architects and others [illegible] who are concerned with the choice of [illegible] type of construction to be used for [illegible] particular building, [illegible] provides authoritative descriptions and discussions of accepted materials and systems of construction for the various structural elements including framing, floor, roof, [illegible], and foundation. There are frequent references to codes, standards and other related literature and an abundance of well-chosen illustrations. The first edition [illegible] as published in 1947. Although written from the same viewpoint and composed of the same number of chapters [illegible] the same titles, this second edition contains [illegible] range of new material reflecting the very extensive changes in the building construction that have come about in the past decade in the United States of America.

DALZELL, J RALPH

Blueprint reading for home builders. New York McGraw Hill Book Company Inc. 1955 138 p. illus. 31 cm. $5.50 5565

Contents. Introduction. Scaling and dimensioning. Elevation views. Plan views. Section views. Detail views. Mechanical details. Survey and plot plans. Written specifications. Blueprint reading.

Note. By limiting the scope of this book to the kinds of drawings used in the construction of residential houses the author has been able to cover the ground in detail and to discuss numerous points [illegible] such there would not be room in [illegible] book on blueprint reading in general. No previous acquaintance [illegible] architectural drawing is necessary in order to understand the book. The general scheme of exposition is to reproduce drawings, then to discuss them point by point, hence, [illegible] considerable part of the space in the book [illegible] occupied by illustrative matter. In the body of the work the illustrations are black and white reproductions of line drawings, but reproductions of blueprints are bound in at the end. The book is suitable for use as [illegible] vocational school text for students preparing for the home building industry

DALZELL, J RALPH

Simplified masonry planning and building. New York McGraw Hill Book Company Inc., 1955 370 p. illus. (part col d) 23 cm. $5.00. 5566

Contents: Introduction. Cement. Mortar. Concrete—footings—foundations—floors—block. Typical concrete-block details. Concrete-block walls, foundations, and pilasters—chimneys. Stucco. Insulation. Illustrative example. Miscellaneous masonry projects. Index. Blueprints—Plates [illegible] to vi.

Note: An elementary practical book suitable for use as [illegible] vocational school text and as [illegible] reference manual for practical builders, including amateurs. It covers standard materials and techniques in building small structures of poured concrete and concrete block. It is written in [illegible] simple style and is generously illustrated. Structural clay tile and brick masonry are not included, otherwise, the book covers about the same ground as *Masonry simplified,* written by the author and G. Townsend and described above.

DALZELL, J RALPH AND GILBERT TOWNSEND

Bricklaying, skill and practice. Illustrations by Arthur E. Burke. Second edition. Chicago American Technical Society 1954 184 p. illus. 22 cm. $3.50. 5567

Contents: Brick masonry. Where bricks are used. Typical brick masonry details. How to lay bricks. Fireplace design and construction. Chimneys and fireplace construction. Index.

Note: A textbook designed for vocational courses offered to young men [illegible] who are planning to become brick masons. It begins with

ticularly heavy types, to aid in efficient planning and operation of construction plants. Based on a series of articles that appeared in *Construction methods*.

AMERICAN INSTITUTE OF STEEL CONSTRUCTION

Steel construction a manual for architects, engineers and fabricators of buildings and other steel structures. Fifth edition. New York American Institute of Steel Construction, 1946 432 p illus 23 cm. 5555

Contents (abridged) Part I: Rolled steel structural shapes. Rolling mill practice. Miscellaneous data for designing and estimating. Part II. Estimating and detailing information: Detailing practice. Standard beam connections. Separators, tie rods, and anchors. Field rivet and erection clearances. Pipe railing details. Rivet dimensions, weights, etc. Screw threads. Bolt and nut dimensions, weights, etc. Part III, Allowable loads by A. I. S. C. specification. Part IV Standard specifications and codes American Institute of Steel Construction. American Institute of Bolt, Nut and Rivet Manufacturers. American Society for Testing Materials. American Welding Society United States Department of Commerce. Part V Miscellaneous data and mathematical tables. Index.

Note A widely used designers' and draftsman's handbook. Most of the changes in this edition had their origin in revised specifications and in changes in rolled shapes now being manufactured. A sixth edition was published in 1957 $3.50.

ANDERSON, L O, AND O C HEYER

Wood frame house construction Prepared by the Forest Products Laboratory, U S Forest Service. Washington D C Government Printing Office, 1955 235 p illus 23 cm. (United States. Department of Agriculture Agriculture handbook no 73) $0 65 5556

Contents Introduction. Location and excavation. Concrete work. Foundation walls and piers. Concrete floor slabs on ground. Floor framing. Wall framing. Ceiling and roof framing. Wall sheathing. Roof sheathing. Exterior trim and millwork. Roof coverings. Exterior frames, windows, and doors. Exterior siding and stucco. Framing details for plumbing. Framing details for heating systems. Wiring. Insulation. Ventilation. Interior-wall and ceiling finish. Floor coverings. Interior doors, frames, and trim. Millwork. Stairs. Sheet metal work. Porches and garages. Chimneys and fireplaces. Drives, walks, and basement floors. Painting and finishing. Protection against decay and termites. Protection against fire. Methods of reducing building costs. Protection and care of material on the building site. Maintenance and repair Literature cited. Glossary of housing terms. Index.

Note The purpose of the publication is to "present sound principles for wood-frame house construction and suggestions for selecting suitable materials in a manner that will greatly assist in the construction of good house even by those without previous construction experience. It sets forth what are considered by the Forest Products Laboratory to be acceptable practices in assembling and arranging the parts of a well-designed frame house Construction details are given in a series of drawings. All construction requirements, as well as species and grades of lumber specified, conform as nearly as practicable to Federal Housing Administration minimum property requirements. Planning and designing are not covered. In addition to its use by amateur builders, the book is also suitable for use as teaching text for apprentice carpenters and as guide to judging quality in frame house construction.

ARCHITECTURAL RECORD

Architectural engineering new concepts new methods, new materials new applications New York, F W Dodge Corporation 1955 494 p illus. 30 cm. $11 50 5557

Contents (abridged) Section 1 Building shell Structural frame, walls, roofs, floors. Prefabrication. Section 2 Environmental control: Heating and air conditioning—panel heating—air conditioning—new devices and systems—condensation. Lighting. Acoustics. Section 3, Utilities. Electrical systems. Vertical transportation and materials handling. Section 4 Site planning: Drainage. Foundations. Roads and parking. Section 5 Materials. Concrete. Wood. Wood protection. Glass. Plastics. Flooring. Section 6, Special problems. Structural safety Fire and explosion protection. Planning for atomic energy Index.

Note Approximately 100 articles published during the past nine years in *Architectural record* have been collected in this volume. Both text and illustrations have been reprinted. The range of topics is indeed wide, from discussion of experiences with unpainted wood siding to uses of prestressed concrete. The title Architectural engineering is inappropriate, for there is no resemblance to systematic treatise. Rather the book provides within one set of covers a series of informative, expertly written but separate accounts of recent developments in building materials and techniques, together with a few articles on older techniques, such as are employed in the drainage of building sites. The index is good one that includes architects' and builders' names as well as topics.

ARCHITECTURAL RECORD

Time-saver standards a manual of essential architectural data for architects, engineers, designers, builders, draftsmen, and other technicians. Third edition. New York F W Dodge Corporation, 1954 888 p. illus. 29 cm. $12.50 5558

Contents (abridged) Office practice—drafting standards, symbols, fundamental data. Structural design and construction methods. Design elements—residential—non-residential. Recreation, site planning, landscaping. Building materials and equipment.

Note A standard reference book, well known in architectural and technical libraries, including the office libraries of architects and draftsmen. Each of the sections named in the above table of contents has a number of subsections devoted to specific topics of which "Windows—wood, Retail shops—interior displays," and "Office lighting" will serve as examples. Selected literature references are usually included. In this edition, the book has been reorganized and considerable range of material added. Room was made for the new material by deleting certain material that appeared in preceding editions. Much of the material was reprinted from *Architectural record* and other publications.

BLAKE, MARION ELIZABETH

Ancient Roman construction in Italy from the prehistoric period to Augustus a chronological study based in part upon the material accumulated by the late Dr Esther Boise Van Deman. Washington, D C Carnegie Institution of Washington 1947 421 p. illus. 29 cm. (Carnegie Institution of Washington. Publication 570) $10 00 5559

Contents List of plates. Selected bibliography and abbreviations. Types of evidence. Roman building materials. Stone walls in Italy Squared-stone construction in Rome and vicinity Arch and vault construction in cut-stone work. Opus incertum to opus reticulatum. Sun-dried and semi-baked bricks. Brick and tile construction. Mortar and similar mixtures. Concrete. Indexes. Sites other than Rome. Rome. Types of evidence. Materials used in building. Subjects.

Note A carefully-documented, scholarly study Although it is of primary interest to archaeologists, it is also valuable to students of the history of building and engineering. Detailed and precise information is presented on both building materials and methods of building.

BURBANK NELSON L

House carpentry and joinery Fifth edition. New York Simmons-Boardman Publishing Corporation 1952 219 p. illus. 29 cm. o.p. 5560

Contents. Tools and equipment. House plans. Excavations. Foundation forms. Foundations. Sills. Girders. Floor joists. Sub flooring. Outside framed walls. Inside framed walls. Plumbing framed work. Sheathing walls. Ceiling joists. Roof framing. Roof sheathing. Cornices. Roofing. Porch and bay framing Exterior wall covering. Interior wall covering. Stairs. Interior trim Windows. Doors. Hardware. Closets, shelving and built-in equipment. Finished flooring.

Civil Engineering

Government Printing Office, 1954 220 p. illus. 23 cm. (United States. Department of Agriculture. Technical bulletin no 1069) $0.60. 5574

Contents: Introduction. Part 1. Fabrication: Performance record of glued joints in laminated construction. Properties and characteristics of woodworking glues. Selection of glues for laminating. Selection and preparation of lumber for laminating. Layout of laminated assembly. Gluing jigs and forms. Gluing of edge and end joints. Gluing laminated assemblies. Equipment for applying glued pressure. Clamping techniques for straight and curved members. Curing the glue in laminated assemblies. Rate of heating in large units of laminated clamped assemblies. Plant and machinery [illegible]. Control instruments [illegible] for laminating operation. Control [illegible]. Methods of evaluation of product. Preservative treatments of laminated wood and gluing of treated wood. Part II. Design: Basic features of glued laminated wood construction. Calculation of working stresses. Design considerations for laminated wood. Suggested specification requirements. Glossary. Literature cited. Appendix: Effect of end joints. Effect of knots. Effect of form and [illegible]. Relation of strength properties to curvature. Height of beams. Strength of glued laminated construction made of this [illegible]. Concentrations of shear stress near load points of beams. Index.

Note: Glued laminated wood construction has been developed as a technique adapted to a wide variety of building and construction uses. Theaters, churches, gymnasiums, warehouses, barns, bridges [illegible] in which it is employed, in addition to [illegible] shipbuilding and boatbuilding. This bulletin is based upon research carried on at the Forest Products Laboratory of the U. S. Forest Service, Madison, Wisconsin. It tells the advantages and applications of this type of construction and covers all the technical phases of its use. Although the publication is primarily a guide to the fabrication and design of such glued laminated members as beams, arches, and truss parts, the fabrication principles set forth are applicable to glued laminated articles of all types and sizes.

HANSEN HOWARD JAMES

Modern timber design. Second edition. New York John Wiley & Sons Inc., 1948 312 p. illus. 23 cm. $6 50. 5575

Contents: Characteristics and properties of wood. Mechanical and physical properties. Grading rules and working stresses. Mechanics of wood. Fastenings. Beams and columns. Wood trusses. Timber decks and bridges. Glued laminated construction. Plywood. Decay, wood-destroying organisms, and preservatives. Appendixes. Index.

Note: This college textbook has also proved useful to practicing engineers concerned with the design of wooden structures. It has been revised so as to conform with the National Lumber Manufacturers Association's *National design specification for stress grade lumber and its fastenings* (1944). Most chapters show some alteration, but the most extensively revised are the third and fifth, two—those on mechanical properties and on mechanics—are new.

HANSEN HOWARD JAMES editor

Timber engineers' handbook. New York John Wiley & Sons, Inc., 1948. 882 p illus. 21 cm. $15.00. 5576

Contents: Factors affecting strength. Grading rules and working stresses. Standard terms and abbreviations. Sizes and properties of sections. Weights. Loadings. Simple beams. Continuous beams. Trussed beams. Columns—solid. Spaced columns. Combined stresses. Fastenings. Trusses. Glued laminated construction. Plywood. Floor systems. Buildings. Poles and piling. Protection and maintenance. Appendix. Index.

Note: Here are brought together in readily accessible form basic information and reference data of particular value to engineers concerned with the design of wooden structures. Numerous diagrams and charts are used to illustrate and give data on definitions, location and details of construction. The appendix contains "Table of uniformly distributed loads" in which the following information is given for (1) nominal sizes of timber ranging from 2 in. × 3 in. to 24 in. × 48 in., (2) fiber stresses ranging from 950 lb. to 2 400 lb. per sq. in. and (3) spans ranging from 3 ft. to 50 ft. W total load; H maximum horizontal shear for load W; d, maximum deflection for load W; W' total load in pounds limited by deflection of 1/360 of span.

HAUF, HAROLD DANA, AND HENRY A PFISTERER

Design of steel buildings. Third edition. New York John Wiley & Sons, Inc. 1949 280 p. illus. 22 cm. $6 00. 5577

Contents: General considerations. Reactions, shear and bending moment. The design of beams. Riveted connections. Plate girders. Columns and struts. Roof trusses. Wind stresses in tall buildings. Welded construction. Building design project. Appendixes. Index.

Note: An introduction to the basic principles of structural steel design [illegible] for students of architectural engineering and for the guidance of the beginning architect or engineer. The book deals specifically with the structural design of such types of buildings as apartment houses, offices, schools, etc. The treatment assumes knowledge on the part of the reader of the elements of mechanics and strength of materials. Little change has been made in the scope or arrangement of this new edition. However [illegible] chapter on welded construction has been added, codes of practice and specifications have been brought up to date, and the chapter on the design of beams has been extensively revised.

HAWKINS, REGINALD R., AND C H. ABBE

New houses from old, a guide to the planning and practice of house remodeling. New York McGraw Hill Book Company, Inc., 1948. 558 p. illus. 24 cm. $6 50. 5578

Contents: Remodel! New houses from old—some examples. The chief types of house construction. How to judge a house for remodeling. Halls and stairs. Living rooms. Dining rooms. Kitchens. Bathrooms. Bedrooms. Closets and storage space. Basements. How to do remodeling. Masonry work. Foundations. Chimneys and fireplaces. Interior walls. Exterior walls. Windows and doors. House framing. Roofs. [illegible] walls and trim. Floors. Painting and papering. Heating. Insulation. Plumbing. Water supply. Sewage disposal. Wiring and lighting. Useful books and pamphlets. Addresses of organizations and publishers. Appendix. Index.

Note: About one-third of this book deals in nontechnical language with the problems faced by anyone who plans to modernize a dwelling house. In this part are discussed the modern requirements for comfortable and efficient houses and how these requirements can be obtained by well-planned remodeling of constructed houses. The rest of the book is concise, encyclopedic discussion of the building materials and techniques that are employed in house remodeling. The work is addressed primarily to actual and prospective homeowners, but it contains much information that is also of value to amateur and professional building craftsmen. There are about 150 illustrations.

HOLMES BURTON H editor

Materials and methods in architecture a compendium of technical articles selected from *Progressive architecture* New York Reinhold Publishing Corporation 1955 412 p. illus. 30 cm. $11.50 5579

Contents: Construction methods today and tomorrow. The role of steel. Aluminum-faced structures. Wood forever. Our approach to concrete. Three building types. Insulation and structure. Foundations. Construction materials data: Ubiquitous steel. Aluminum, the challenger. Concrete and plaster. Insulation—money in the bank. Flashing moves in. Interior materials. Surface protection. Environmental control today and tomorrow. Sun angle data. Lighting summary. Water supply and laboratory plumbing. Equipment. Index.

Note: Certain walls of steel and aluminum, laminated wood arches, prestressed concrete, vermiculite plaster. Cases, perimeter heating, residential air conditioning, cold cathode fluorescent lighting, and television antenna systems for apartment houses are some of the newly developed materials, techniques and equipment described in this volume. As indicated, all of the articles appeared first in the periodical *Progressive architecture*. They appeared over a period of six years. The volume is not, therefore, a systematic, comprehensive treatment of new things in building, but is instead a collection of rather miscellaneous articles, tied together by a not very pronounced central theme and a general index.

HORNUNG WILLIAM J

Architectural drafting. Second edition. Englewood Cliffs, N J Prentice-Hall Inc.,

elementary information on tools and materials, explains the technique of laying up ordinary brick walls, piers, etc., and concludes with two chapters on the design and building of fireplaces and chimneys. In short, it covers the brick-laying technique and related information that a mason would use in constructing such structures as dwelling houses. It is fully illustrated. Much of the material, both text and illustrations, has been taken from the author's *Masonry simplified*.

DALZELL, J RALPH, AND OTHERS

Building trades blueprint reading. Part I, Fundamentals. Third edition, by Rex Battenberg and W Rahy Paul. Contributor, Chapter 7, William Woltjes Chicago American Technical Society, 1956 128 p illus 28 cm $2 75 5568

Contents. Working drawings. Elevation views. Plan views. Dimensioning and scaling. Structural details. Survey and plot plans. Regional variations. Final examination. Appendix.

—— Part II, Specifications, blueprints and examinations. Second edition revised By J Ralph Dalzell Chicago American Technical Society 1950 234 p illus 28 cm $2 40 5568A

Note A practical introductory course used in vocational schools and in training courses for apprentices. It includes several full-sized blueprints of residential buildings in addition to many drawings in reduced scale.

DALZELL, J RALPH, AND GILBERT TOWNSEND

How to remodel a house. Chicago American Technical Society, 1942 528 p illus. (part col'd) 22 cm. $5.25 5569

Contents Types of home architecture. How to read architectural plans. Specifications. Fundamentals of remodeling. How to select architectural types. Architectural drawings. Structural details. Stairs. Insulation. Selection of materials. Bathrooms. Remodeling kitchens. Heating and air-conditioning. Electric lighting and wiring. Remodeling rooms. Floor plans and elevations for remodeling. Illustrative example. Index. Blueprints.

Note A book intended as a guide through every step of reasoning, planning, and designing, with regard to individual rooms or entire floors and exteriors. Studies are given in the evaluation of insulation, air-conditioning and heating plants, plumbing, electric wiring. Detailed drawings and many photographs are used. The index is extensive. Questions and answers follow each chapter

DALZELL, J RALPH, AND GILBERT TOWNSEND

Masonry simplified. Volume I, Tools, materials practice. Contributor to third edition Edward Matzke. Chicago American Technical Society, 1956 463 p illus 22 cm. $5 40 5570

Contents Lime, its manufacture and application. Mortar types, properties, and uses. Concrete characteristics and mixing. Blueprint reading. Concrete masonry. Structural clay tile. Brick masonry. Masonry sidewalks, driveways, floors, and steps. Illustrated dictionary of building terms. Index.

Note. A successful practical text intended primarily for the use of vocational school students. It is written in a simple direct style and is thoroughly illustrated. The first edition was published in 1948. Although this second edition is 96 pages longer the increase is due to the inclusion of a dictionary of building terms that did not appear in the first edition. The chapters have the same titles and the same numbers of pages as those in the first edition However the fifth chapter entitled "Concrete masonry" has been extensively revised in both text and illustrations. In contrast there are few if any changes in other chapters. Volume II, *Practical construction* second edition, was published in 1957 438 p., $5.95.

DIETZ, ALBERT G

Dwelling house construction. Second edition Princeton D Van Nostrand Company, Inc., 1954 396 p illus. 24 cm. (A technical series on building construction, Walter C. Voss, editor) $8 00 5571

Contents. Inspection of the site. Building layout. Excavation, sanitary systems. Foundations. Framing. Chimneys and fireplaces. Windows. Roofing and flashing. Cornices, gutters, leaders. Exterior finishes, water tables. Insulation. Lath and plaster—dry" walls. Interior finish. Hardware. Painting. Panel construction. Index.

Note A compactly written textbook and manual covering the structural and finishing details and methods of construction currently used in the building of small dwelling houses in the United States of America. It covers only houses with wooden frames. Houses with walls built of masonry units or solid masonry are not discussed, but houses with masonry veneer walls over wooden frames are included. It is used both as a textbook in college courses and as a home study and reference book. Concise discussions of specific topics are supplemented by many clear drawings, and by model specification clauses however there are no reference lists or guides to sources of additional information. The first edition was published in 1946. In this second edition, the chapter on panel construction, which describes the structural principles and methods of erection of houses built of prefabricated panels, is newly added. All of the other chapters have been carried over from the preceding edition, with major changes only in the chapter on hardware. The author is Professor of Building Engineering and Construction of Massachusetts Institute of Technology

DUNHAM, CLARENCE WHITING

Planning industrial structures. New York McGraw Hill Book Company, Inc., 1948. 481 p. illus. 23 cm. $8 00 5572

Contents General planning of structures. Exploration of the site. Daylighting industrial plants. Electric lighting and power. Ventilation. Roofs. Floors. Walls and partitions. Steel mill buildings. Multistory steel buildings. Concrete structures. Wooden structures. Foundations. Machinery foundations. Miscellaneous considerations and structures. Some lessons in structural planning. Index.

Note The scope of this work is the planning and design of factory buildings and other industrial structures. It deals mainly with two aspects the principles of planning so as to obtain maximum of suitability to the operation that will be performed in the plant, and special points and "know-how" for which there is no space in the usual handbook. Design is carried only through the selection of materials and parts. Thus in the chapter on floors, there is information on types of floor construction and on special details, such as joints, but none on methods of calculating allowable spans, because the work is intended chiefly for engineers who are already well grounded in the theory of structures.

FICKES, CLYDE F, AND W ELLIS GROBEN

Building with logs. Washington D C. Government Printing Office, 1945 56 p. illus. 23 cm. (United States. Department of Agriculture. Miscellaneous publication no 579) $0.25 5573

Content Building the foundation. Preparing the logs. Dimensions of the building Framing the corners. Door and window jambs. Floor joists. Laying the wall logs. Window and door openings. Window and door frames. Roof framing. Partitions. Flooring Interior wood finishing. Calking. Chinking. Chinkless log-cabin construction. Hewing timbers. Fireplace framing. Oiling and painting. The finished structure. Furniture. Building plans. Additional information.

Note Issued by the United States Forest Service, this publication gives the basic principles needed for successful building with logs. It assumes that the reader is familiar with the ordinary frame-building methods used where wood is the principal construction material. The illustrations include photographs of modern log buildings and building plans for four log residences. Plans are also given for furniture suitable for a log house.

FREAS, A. D, AND M L SELBO

Fabrication and design of glued laminated wood structural members. Washington D C.

Note: Practical and dependable manual for all concerned with the planning and erection of brick masonry work—including not only contractors and masons, but also architects, manufacturers, and others interested in the efficient and economical application of masonry materials. Describes every type of work performed by bricklayers and masons, every type of material handled by them, giving methods, pointers, and technical data to aid in best selection and handling of these materials, and numerous tables of labor and materials requirements for a quicker and more accurate estimating.

NATIONAL RESEARCH COUNCIL

Metal curtain walls the edited papers and discussions of a research correlation conference conducted by the *Building Research Institute* in the Chamber of Commerce of the United States in Washington D C. on September 28 and 29 1955 Washington D C. National Academy of Sciences—National Research Council, 1955 190 p. illus. 27 cm. $4.00. 5587

Contents: Welcome to conference, by C. H. Topping. Introduction to the conference, by E. X. Tuttle. Part I, Recent studies of metal curtain walls: Survey of architects, by W. A. Taylor. BRAB survey by W. H. Scheick. Detroit Edison survey by J. O. Blair. Part II, Architectural design, by M. Abramovitz and R. W. McLaughlin. Discussion. Part III, Performance requirements in panel design, by T. L. Rogers. Discussion. Part IV, Structural design techniques: The design of metal curtain walls, by J. H. Callender. Metal curtain wall structural design techniques, by R. E. Perry. Core material and adhesives for sandwich panel construction, by J. M. Rubin. Discussion. Introduction to Parts V, VI, and VII, by H. B. Tate. Part V, Panel moisture and condensation control: Thermal insulation and condensation control in metal curtain walls, by E. R. Queer. Part VI, Sound transmission, by R. B. Newman. Part VII, Erection of metal curtain walls, by N. S. Collyer. Discussion of Parts V, VI, and VII. Part VIII, Summary and future outlook, by F. J. Close and D. E. Sargent.

Note: Published in this volume are the proceedings of a conference which was attended by architects, engineers associated with the manufacturers of building materials, and others. The conference was concerned with the manufacture and uses of prefabricated metal panels for the exterior walls of buildings, a relatively new development which has already had a tremendous architectural impact on the American skyscraper.

NATIONAL RESEARCH COUNCIL

Plastics in building the uses, past and present, and the potentialities of plastics in building as reported at a conference conducted by the Building Research Institute October 27 and 28, 1954 at the Chamber of Commerce of the United States in Washington, D C. Washington, D C National Academy of Sciences—National Research Council, 1955 149 p. illus. 28 cm. $5.00. 5588

Contents: Part I, An introduction to plastics in building: Plastics and its building construction, by E. B. Cooper. Physical and engineering properties of plastics, by A. G. H. Dietz. Evaluating plastics for building applications, by T. S. Rogers. General discussion. Part II, Specific uses of plastics in building: Light-transmitting panels, by J. L. Borkum. Glazing and interior illumination, by O. L. Freeman. Plastic thermal insulations and vapor seals, by R. N. Kennedy. Plastics in structural panels, by A. T. Wahlstedt. Surfacing and decorative uses of plastics in building, by H. McCann. Plastic piping, plastic ducts and conduits, by R. B. Seymour. General discussion. Part III, Standards and codes for plastics in building: Standards for plastics products, by G. M. Kline. Building code regulation of plastic building materials, by F. J. Kirk. General discussion. Part IV, Future uses of plastics in building: The future of plastics in building, by J. A. Bergstrom. General discussion. Part V, Summaries of the conference: For the plastics industry by R. K. Mueller. For the building industry by H. K. Hunsucker. Closing remarks, by W. H. Scheick. Appendix: A discussion of the building code regulation of plastic building materials, by S. H. Ingberg. A report on sprayed-on plastic coatings, by G. G. Rathgeber. Index.

Note: The conference whose proceedings are published in this volume was attended by architects, chemists, research directors, and other professional persons interested in the plastics and building industries. Many applications, both developed and potential, are described or at least mentioned in the papers and discussions.

NATIONAL RESEARCH COUNCIL

Porcelain enamel in the building industry Sponsored by the Building Research Advisory Board and the Porcelain Enamel Institute. Conducted by The Building Research Institute Division of Engineering and Industrial Research. *Washington, D C. National Academy of Sciences*—National Research Council, 1954 146 p. illus. 27 cm. (National Academy of Sciences—National Research Council. Research conference report no. 6) $6.00. 5589

Contents: Session I, Fundamental properties of porcelain enamel: Porcelain enamel—from an ancient art to a modern industrial material, by D. Chase. Chemical properties of porcelain enamel coatings, by G. H. Spencer-Strong. Physical characteristics of porcelain enamel, by E. E. Howe. Weather resistance of porcelain enameled structural units, by D. G. Moore. Radiochemical decontamination characteristics of porcelain enamel, by G. W. Parker and G. M. Herbert. Porcelain enamel manufacturing processes, by G. H. McIntyre. Methods of testing architectural porcelain enamels, by W. N. Harrison. General discussion. Session 2, Uses of porcelain enamel in building design: The design, manufacture, and erection of architectural porcelain metal parts, by R. B. Loring. Porcelain enamel curtain walls and their utilization in the building industry, by E. X. Tuttle. An architect's viewpoint of porcelain enamel used alone and in combination with other materials, by W. Lescaze. Creative uses of porcelain enamel, by R. W. Hamilton. General discussion. Session 3, Porcelain enamel as an engineering material: Engineering properties of porcelain enamel, by F. R. Bagley. Flues, furnaces, and exhaust systems using high temperature porcelain enamels and ceramic coatings, by A. I. Andrews. Porcelain enameled aluminum, by R. C. Cribber. General discussion. Session 4, Building experience with porcelain enamel—problems, solutions, costs: The use of porcelain enamel for hospitals, by J. J. Sender. The use of porcelain enamel in sales structures, by F. R. Fritsch. The use of porcelain enamel for houses, by W. W. Lubbock. Porcelain enamel steel in industrial buildings, by M. Mohr and C. F. Block. General discussion. Conference summary by W. H. Scheick.

Note: The proceedings of a conference held in November 1953 are published in this volume. Both in the papers and in the remarks of the discussants much light is focused on the status of porcelain surfaced metals in the building industry and on problems and techniques of manufacturing porcelain enameled sheets and other porcelain enameled building materials. Literature references are included in some of the papers.

NATIONAL RESEARCH COUNCIL. BUILDING RESEARCH ADVISORY BOARD

Condensation control in buildings as related to paints, papers, and insulating materials. Proceedings of a conference conducted by the Building Research Advisory Board February 26 and 27 1952 Washington, D C. National Academy of Sciences—National Research Council 1952 118 p. illus. 28 cm. (Building Research Advisory Board. Research conference report no. 4) o.p. 5590

Contents: Session 1, *The problem and its causes:* Introduction, by L. Harper. Panel discussion, by K. Sargent and others. Technological aspects of condensation control in building structures, by C. E. Lund. The movement of moisture in building materials, by J. D. Babbitt. General discussion. Session II, Current technical progress: Introduction, by J. S. Long. Water permeability of panel materials for wall construction, by K. J. Dunn, Jr. Panel discussion, by W. Vanney and others. General discussion. Session III, Current technical progress, continued: Paper and foil films, by F. Neubach. Panel discussion, by F. A. Joy and others. General discussion. Session IV, Current technical progress, concluded: Influence of construction methods and materials on con-

1955 221 p illus 28 cm. (Prentice Hall Technical industrial vocational series, Claude H. Ewing, editor) $6.35 5580

Contents. Construction principles. Standard details for house construction. Planning the house. Starting the house plans. Heating the house. Plumbing for the typical dwelling. Electric wiring for the home. The model house. Glossary of work terms. Index.

Note All types of drawings currently used in the United States of America in the course of construction of small houses are covered in this introductory textbook. The book thus parallels introductory textbooks on engineering drawing, but is limited to architectural drawing. It is written in a simple, straightforward styl and is fully illustrated. It is used for the instruction of secondary and vocational school students who are preparing for careers as draftsmen and as a basic book to learning the reading of architectural blueprints. The first edition was published in 1949 The second and third chapters on house construction details and house planning are added in this second edition.

KELLY, BURNHAM

The prefabrication of houses a study by the Albert Farwell Bemis Foundation of the prefabrication industry in the United States. New York The Technology Press of the Massachusetts Institute of Technology and John Wiley & Sons, Inc., 1951 466 p 23 cm. $8.50 5581

Contents Definitions. The development of the industry 1946–1949 great expectations and disappointments. The future of prefabrication. Introduction. Management. Design. Procurement. Production. Marketing. Conclusion. Appendixes. Procedure. Companies and people visited. List of prefabricators. Annotated bibliography Index.

Note An authoritative and detailed analysis of the history and contemporary status of the prefabricated housing industry in the United States of America. The main emphasis is on the complicated business aspects of the industry rather than on manufacturing and structural details. Nevertheless, enough is included on structure to make the book worth reading by anyone interested in the technical aspects. A considerable part of the material in the volume is based on field survey of the industry in the United States of America after World War II.

KENNEY, JOSEPH E

Blueprint reading for the building trades Second edition. New York McCraw Hill Book Company Inc., 1955 120 p illus. 30 cm $5 00 5582

Contents The scope of architecture. The importance of blueprints. Blueprints and their use. Language of the blueprint. Symbols. Conventions. Schedules. Scale representation. Brickwork. Different types of blueprints or drawings. Specifications. Construction details and practice problems. California house. First and second-class construction. Lever House. Modern concrete house. Store planning. Estimated cost of building. Architectural and building terms. Index

Note How to read the working drawings (called blueprints because of their usual background color) used as guides to construction in the building trades is taught in this introductory and practical book. The common aspects of blueprints such as symbols, conventions, and scales are explained in the preliminary chapters In the chapters that follow the instruction is centered on the interpretation of the blueprints which ar included in the book An unusual feature is the inclusion of reproduced reproductions of actual working drawings, reduced in size for a house designed by Richard J Neutra. Although used primarily as text in practical courses at the vocational school level, the book is suitable also for self-instruction by carpenters, prospective homeowners and others who wish to teach themselves how to read building trades blueprints.

KETCHUM, MILO S

Handbook of standard structural details for buildings Englewood Cliffs N J Prentice-Hall, Inc., 1956 120 p illus. 26 cm. $4 65 5583

Contents Introduction. Small house. Small masonry building. Reinforced concrete building. Steel frame building. Industrial building. Timber building. Index.

Note Addressed to draftsmen, architects and others who are acquainted with basic techniques in architectural drawing, this book is designed to teach some of the fine points of preparation of practical working drawings for building construction. The emphasis is—to use the author's words— on the routine presentation of the minimum essential information for construction. Six types of building structures, as named in the chapter titles, are considered. Each drawing is accompanied by a brief discussion of its main features and a more extensive discussion of the reasons for the inclusion or omission of specific details. The author is a member of the firm, Ketchum and Konkel, consulting engineers in Denver, Colorado.

LAIR, E A.

Carpentry for the building trades. Second edition. New York McGraw Hill Book Company, Inc., 1953 310 p. illus. 23 cm $5.50. 5584

Contents: Framing. Rafter framing. Roofing and siding. Lath and plaster Finish—trim, windows, and doors. Glass—glazing—insulation. Lumber—grading and measuring. Scaffolds and safety measures. Blueprints and specifications. Projects, questions, and problems. List of visual aids. Index.

Note. A clearly written, elementary book. It is primarily textbook for use in practical courses, but is useful also to home owners and amateur builders who wish to know how houses are constructed or to undertake simple building operations. All of the tasks that fall to the carpenter in the building of small houses are described in simple language and clear illustrations. The first edition was published in 1947 This second edition represents considerable revision and augmentation, reflecting such developments in homebuilding in the United States of America as houses without basements, fully insulated houses, picture windows, etc. There are now 326 figures, some of which contain several illustrations.

MERRILL, ANTHONY FRENCH

The rammed-earth house with an introduction by the Hon Clinton P Anderson, Secretary of Agriculture. Illustrated. New York Harper & Brothers, 1947 230 p illus. 21 cm. $3 00 5585

Contents (abridged) The history of rammed-earth from Hannibal to Hibben. The pros and cons—what can be done with earth and where the dra backs lie Designing for rammed-earth. Soil selection and preparation. Building the rammed-earth house. Soil-cement—rammed in place, rammed in blocks or puddled. Cement-water paints. The Bureau of Standards tests—a short description of the results of official strength comparisons of earth and standard building materials. Bibliography

Note A popular book on the use of rammed-earth (also known as *pisé de terre*) as building material for house walls. Soil-cement mixtures and soil asphalt mixtures are discussed, as ell as natural soils. Although the book is intended for reading by persons without technical training, technical matters such as the framing of rammed-earth houses, the making of soil-cement bricks, etc., are discussed at some length. The book is both a plea for wider use of rammed earth in house construction and manual for builders and potential house owners who wish to experiment with this type of wall construction. The assumption that the verage man can build house of this material appears to underlie the author's discussion. The extensive bibliography includes references to both technical and nontechnical literature.

MULLIGAN, JOHN ALOYSIUS

Handbook of brick masonry construction New York McGraw Hill Book Company Inc. 1942 526 p illus. 23 cm. $8 00 5586

Contents Bricklaying. Concrete masonry Sand. Concrete Cement. Lime. Mortar Joints. Bond. Brick. Common brick. Firebrick. Face brick. Testing brickwork. Structural terra cotta and hollow tile. Composite masonry Sewer pipe. Concrete building units. Cavity walls. Brick veneer Backing of rubble masonry Cement plaster and pargeting. Stone masonry Limestone and rubble masonry Architectural terra cotta. Weathering. Efflorescence and stains. Glass-block masonry Window calking. Underpinning. Reinforced brickwork. Brickwork for boiler setting. Fireplaces and chimneys. Paving. Swimming pools. Timbrel arch construction. Specifications. Definitions and tables. Glossary

Building

PULVER, HARRY E.
Construction estimates and costs. Second edition. New York McGraw Hill Book Company Inc., 1947 653 p. illus. 23 cm. $8.00. 5596

Contents: Estimating in general. Handling and transporting materials. Excavation. Piling and bracing. Concrete. Masonry. Dampproofing and waterproofing. Wood construction. Structural steel. Roofing and flashing. Lathing and plastering. Heating and air conditioning. Plumbing. Electrical work. Painting, papering, and glazing. Heavy machinery. Construction plant and equipment. Overhead and profit. Complete estimates. Approximate estimates. Construction equipment. Appendices. Diagrams. Index.

Note: A practical manual giving definite and detailed information on methods of estimating construction costs for large and small jobs, buildings, residences, and roads. In considering each aspect of the following items are covered: quantities and costs of materials; labor-hours and costs; amount, kind and cost of equipment needed; items in the overhead and their costs, percentage of profit. Methods of preparing estimates both approximate and complete, of making computations, and of avoiding errors are clearly set forth. Numerous tables and charts together with sample estimates illustrating details discussed in the text are included. The changes made in this edition, compared to the first (1940) pertain almost entirely to changes in prices of material and wage rates.

RAMSEY CHARLES GEORGE, AND HAROLD REEVE SLEEPER
Architectural graphic standards for architects, engineers, decorators, builders draftsmen and students. Fifth edition. New York John Wiley & Sons, Inc., 1956 758 p. illus. 30 cm. $18.95 5597

Contents: Footings, foundations and retaining walls. Wood construction. Steel and concrete construction. Masonry construction. Fireplaces and chimneys. Waterproofing and expansion joints. Exterior wall facings and veneers. Curtain walls. Roofing and sheet metal. Stairs. Miscellaneous metals. Doors, bucks, windows and equipment. Glass, glazing and glass block. Hardware. Furring, lathing and plastering. Interior finishes. Furniture, accessories, equipment and storage. Toilet fixtures, accessories and partitions. Mechanical equipment and related technical information. Landscaping and site work. Sports and games. General information. Area requirements for planning. Index.

Note: Since 1932 when the first edition appeared, this reference book has been accepted among architects, builders, civil engineers, draftsmen and others concerned with building and furnishing of buildings as the standard guide on the structural elements and details, types and dimensions of contemporary building materials, building hardware, furniture and the other aspects of building listed in the chapter titles given above. The fourth edition was published in 1951 and contained [illegible] pages. In this fifth edition, the number of pages has been substantially increased, and a large proportion of the pages carried over has been revised. About 75 per cent of the pages in this edition represent new or revised material. An important change in style is the use of type rather than hand-lettering on the new and revised plates. Also, since the publication of the fourth edition, H. R. Sleeper's Building planning and design standards, New York 1955, has been published as companion volume.

RAY JESSE EDGAR
The art of bricklaying Peoria Chas. A. Bennett Co. Inc., 1950. 240 p. illus. 22 cm. $4.50. 5598

Contents: The story of brick. Composition of brick. Lime, cement, mortar. Tools. Spreading mortar. Corners, raking a four-inch corner. Raising an eight-inch American bond corner. Raising an eight-inch Flemish bond corner. Layout of corners in the various bonds. Important suggestions for the apprentice. Walls—special exercises. Bonds and patterns in brickwork. Chimney construction. Special aspects of brickwork. Arch layout and construction. Brick details and construction. Advanced problems in ornamental brickwork. Photographs of excellent brickwork. Laying cement block. Scaffolding. Glossary of trade terms. Index.

Note: An introductory book written by a man with many years' experience in bricklaying. It is designed mainly for students in vocational classes and for apprentices, but the amateur can also pick up many points in it. The discussion is compact and couched in the language of the bricklayer's craft. The short chapter on concrete blocks is designed for student bricklayers, and is not full enough to meet the needs of the beginning mechanic who does not learn brick laying first.

RICHEY, HARRY GRANT
A reference handbook for construction engineers, architects, builders, superintendents of construction and building construction foremen. New York Simmons-Boardman Publishing Corporation 1951 1,640 p. illus. 18 cm. $11.00 5599

Contents (abridged): Personality and duties. Foundations. Waterproofing. Building stones. Stone, marble and tile work. Brickwork, architectural terra cotta, brick paving. Limes and cements. Mortar and concrete. Concrete construction. Fireproofing and fire prevention. Iron, steel, sheet metal, and roof work. Carpentry and woodwork. Timber and lumber. Lathing and plastering. Painting, varnishing, glazing, and paper hanging. Plumbing, piping, sewage disposal. Heating and ventilation. Electric wiring and various mechanical equipment. Hydraulics, strength, etc., of materials. Drawing, laying out work. Squares, cubes, roots, mensuration. Useful information, receipts, etc. Glossary of engineering, architectural and trade terms. Index.

Note: A relatively new compilation that includes some information not found in the older handbooks of the kind. Although much of the information is what might be called "standard data," some of it is unusual in a handbook of this type. The miscellaneous material covers such matters as how to clean paint, how to hang window sashes with one weight, the best height for plumbing fixtures, and how to remove stains from concrete floors. The author was formerly associated with the United States Treasury Department in the construction of public buildings.

SIEGELE, HERMAN HUGO
Building trades dictionary, a book written in simple language, defining words phrases and expressions pertaining to the building trades covering carpentry bricklaying plastering, concrete construction, stone masonry cement finishing, electrical work, sheet metal work, plumbing, steam fitting, form building painting, roofing, and other building trades. Chicago Frederick J Drake & Co., 1946. 380 p. illus. 23 cm. $3.00. 5600

Note: Although terms are included in this dictionary from all the trades mentioned in its subtitle, a large proportion of them and most of the illustrations relate to carpentry. Most of the definitions are rendered in the language of the trader; hence, the book's chief use will be as an addition to the apprentice's and craftsman's personal libraries.

SIEGELE HERMAN HUGO
Carpentry craft problems a complete practical book of instruction covering all branches of carpentry written in terms commonly used on the job and illustrated from the standpoint of solving the every-day problems of carpenters. Chicago Frederick J Drake and Co., 1952 307 p. illus. 23 cm. $3.50. 5601

Contents (abridged): Tools. Squaring methods, staking out and batter boards. Forms for residence foundations, slabs and beams. Shores and braces. Column and other forms. Sills and floor construction. Second-floor joist supports and bridging. Rough floors, floor openings and dropped ceilings. Framing and raising skeleton walls. Gutters and flat roofs. Cornices. Steps. Lattice work. Cornerboards and outside base. Half-timber work and stucco corners. Building paper and siding. Brackets and gable finish. Door and window frames. Sheathing and shingling. Roll roofing. Screen frames. Job-made doors. Heavy timber joints. Round timber framing and log houses. Mortise-and-tenon and other joints. Heavy timber barns. Trusses. Shoring, needling and heavy-timber bracing. Index.

densation problems, by L. V Teesdale. Panel discussion, by F B. Rowley and others. General discussion. Session v Future technical and educational opportunities The technologists' panel, E. R. McLaughlin moderator H. E. Robinson and others. General discussion. The industrial panel, L. G. Harger moderator W G. Vanney and others. General discussion. Summary of the conference, by T S. Rogers. Bibliography Attendance at the conference.

Note. The condensation of water vapor in the interiors and within the walls of modern buildings, especially residences, is a problem of economic interest as well as one of comfort for the building inhabitants. Published in this volume are the verbatim proceedings of a symposium devoted to the scientific and technical problems and to the progress made toward solving them.

NATIONAL RESEARCH COUNCIL BUILDING RESEARCH ADVISORY BOARD

Housing and building in hot humid and hot-dry climates Proceedings of a conference November 18 and 19, 1952, conducted by the Building Research Advisory Board Washington, D C National Academy of Sciences—National Research Board, 1953 177 p illus. 28 cm (Building Research Advisory Board. Research conference report no 5) $4 50 5591

Contents Introduction to subject of conference, by W R. Woolrich. Session I, Part I, Living in hot environments Practical aspects of tropical living, by R. Walker Significance of hot environments for man, by D H. K. Lee. Bioclimatic approach to architecture, by V Olgyay Panel discussion, M. A. Pond, moderator H. C. S. Thom and others. General discussion. Session II, Part II, Building in hot environments Architectural design for hot climates. Introduction to subject, by A. Mayer Solar control and orientation to meet bioclimatic requirements, by A. Olgyay Design for natural ventilation in hot-humid weather by R. H. Reed. Technology of the cooling effect of trees and shrubs, by R. B. Deering. Building in warm climates, by G. A. Atkinson. Panel discussion, R. Walker moderator: C. W Smith and others. General discussion. Session III, Structures and materials in hot climates. The design of building footings on expansive clay soils, by R. F Dawson. A study of structural features in masonry houses, by J N Thompson. Deterioration problems of materials and structures in hot climates, by B M. Holmes. Performance and properties of materials in hot climates, by G. M Rapp. Heat capacity and the distribution of mass in the design of buildings for hot climates, by J W Drysdale. Panel discussion, D E. Parsons, moderator R. B T yler and others. General discussion. Session IV Mechanical problems in hot climates The economics of livability cooling and heating in hot climates, by W R. Woolrich Roof spray by O E. Sutton. Adiabatic cooling, by R. S. Farr Dehumidification, by T H. Urdahl. Panel discussion T S. Rogers, moderator L. Merle and others. General discussion. Conference summary by W H. Scheick. Devices against the sun by W W Dornberger Comments on papers and discussions. Attendance at the Conference.

Note In this volume, the verbatim proceedings are published of a Conference on living and building in hot climates which was attended by architects, engineers, and other specialists from the United States of America and other countries. The volume is illustrated by many photographs, drawings, diagrams, charts, and tables.

PARKER, HARRY

Simplified design of structural timber New York John Wiley & Sons Inc. 1948 218 p illus. 20 cm. $5 50 5592

Contents Characteristics and classifications of wood. Unit stresses. Working stresses for structural lumber Properties of sections. Bending moments and shear Shearing stresses in beams. Deflection of beams. Design of beams. Joists and rafters. Plank and laminated floors. Timber columns. Bolted joints. Timber connectors. Truss design. Combined bending and axial loading. Trussed beams. Design of purlins. Compound beams. Stud walls. Index.

Note. A concise exposition of practical methods of designing wooden structural members, such as are mentioned in the chapter titles. Like the other books in this author's "Simplified" series, the treatment assumes no previous education in structural design and is aimed at young architects, builders, and other persons whose work requires them to design buildings on sound engineering principles. It is organized so that it may be used as textbook in short courses, or as a home-study book without the guidance of an instructor. Many worked examples are incorporated in the text, there are also problems for the student to work.

PEURIFOY, R. L

Construction planning, equipment, and methods New York McGraw Hill Book Company, Inc., 1956 534 p. illus. 24 cm (McGraw Hill civil engineering series Harmer E Davis, consulting editor) $8.50. 5593

Contents Introduction. Job planning and management. Factors affecting the selection of construction equipment. Engineering fundamentals. Tractors and related equipment. Excavating equipment. Trucks and wagons. Rubber tires. Belt-conveyor systems. Compressed air Drilling and blasting rock. Tunneling. Foundation grouting. Piles and pile-driving equipment. Pumping equipment. Cofferdams. The production of crushed-stone aggregate. Forms for concrete structures. Concrete. Safety engineering. Appendixes: Cost of owning and operating construction equipment. Construction-equipment depreciation schedule. Index.

Note First and foremost textbook for college students of civil engineering, this book has enough scope and includes enough reference data to make it useful to graduate engineers too. The primary viewpoint is that of an engineer who is responsible for the planning and supervision of large construction jobs; however much of the information included is applicable to small operations also. Over-all planning is dealt with rather briefly machines and techniques more fully There is considerable emphasis on the computations necessary in the selection of equipment and calculating its output. Selected literature references are included in the chapters. The author is Professor of Construction Engineering at Texas Agricultural and Mechanical College.

PLUMMER, HARRY C

Brick and tile engineering handbook of design Washington D C Structural Clay Products Institute, 1950 392 p illus. 24 cm. $5 00 5594

Contents Origin and manufacture. Modular coordination. Classification size, color and texture. Properties of structural clay products. Mortar Properties of brick and tile walls. Design of brick and tile walls. Brick and tile wall sections and details. Design of chimneys and fireplaces. Fireproofing and furring. Construction of brick and tile walls. Bonds and patterns. Bibliography Index.

Note A manual of descriptive and engineering data on brick and structural tile. Manufacturing operations are outlined in the first chapter but all the remaining chapters are devoted to discussion and to data useful to architectural engineers, architects, building contractors, and other persons who have practical interests in building with brick and structural tile. There is a fair number of illustrations, the majority of which depict standard structural details. The bibliography covers building codes, specifications and standards, as well as selection of books and articles.

PLUMMER, HARRY C, AND JOHN A. BLUME

Reinforced brick masonry and lateral force design Washington D C Structural Clay Products Institute, 1953 271 p illus. 24 cm. $4 95 5595

Contents History and description. Properties of reinforced brick masonry Minimum design and construction requirements. Design criteria. Lateral force resistant structures. Reinforced brick masonry wall sections and details. Specifications for masonry construction. Construction of reinforced masonry Appendixes. Building code lateral force requirements. Design of reinforced brick beams and slabs. Bibliography Index.

Note. The type of construction to which this book is devoted is described as brick masonry in which steel reinforcement is embedded and so placed that the masonry will be greatly increased resistance to forces which produce tensile, shearing and compressive stresses. The book is professional-grade reference manual covering properties, design, specifications and construction techniques for reinforced brick masonry It includes much engineering data derived from laboratory tests. The chapter on specifications contains complete examples of suggested specifications. The chapter on construction describes recommended methods in detail.

Building

Note: An authoritative reference book on wood as structural material and on the design of wooden structures. It is thoroughly revised and so the design of wooden structures in the United States of America up to the current with design in the United States of America up to the date of publication and covers all modern developments such as timber connectors, glued construction, fire retardants, etc. The chapter titles listed show the general extension of the scope and expansion. Under "Special framing" and "Plywood," such structures as pole frame structures, floor diaphragms, and built-up [illegible] are considered. The chapter entitled Design standards is [illegible] compilation of pertinent design standards and specifications of the National Lumber Manufacturers Association, American Standards Association and American Society for Testing Materials.

TOWNSEND GILBERT

Carpentry a practical treatise on simple building construction, including framing, roof construction, general carpentry work exterior and interior finish of buildings, building forms and working drawings. Illustrated. Revised edition. Chicago American Technical Society 1949 504 p. illus. 21 cm. $2.50. 5609

Contents: Introduction. Framing. The roof. Exterior and interior finish. Farm buildings. Index.

Note: A practical introductory textbook and handbook for carpenters and apprentices. Correct methods are described and illustrated for a wide variety of operations in building construction and general carpentry work. There are 541 figures in the first four parts of the work. The fifth part on farm buildings has been reprinted from another book *Fundamentals of carpentry*, vol. II, by W. E. Durbahn. It contains approximately 30 additional illustrations.

TOWNSEND, GILBERT AND OTHERS

How to estimate carpentry lath and plaster air conditioning, sheet metal linoleum, paint ing, masonry marble and tile, electrical wir ing, plumbing, glass hardware. By Gilbert Townsend, J Ralph Dalzell James McKin ney Collaborators Electrical sections, by Carl H. Dunlap Radiant heating section by Gene Ferrell. Second edition revised. Chi cago American Technical Society 1955 699 p. illus. 22 cm. $6 75 5610

Note: An introductory text on estimating of quantities and costs in building. It is designed for students who are preparing for the building trades by pursuing courses in trade schools. It deals more with actual methods and calculations than with current costs, that is to say, it is not a reference manual of present-day building costs. It was first published in 1939. Up to page 604, this second edition is practically identical with the first edition. Beginning with page 604 there are some 60 pages of new matter on radiant heating systems and estimating in connection with them.

TOWNSEND GILBERT AND J RALPH DAL ZELL

How to plan a house. Second edition. Chi cago American Technical Society 1952 587 p. illus. 23 cm. $6 95 5611

Contents: Types of house architecture. Building lots. Orientation. Styling [illegible] homes. Foundations and footings. Types of materials for walls, partitions, floors, roofs. Designing I beams and other steel support members. Strength of floors, roofs, walls. Standard sizes of materials and spacing parts. Working drawings required for a house. Planning various rooms. Planning floor plans. Designing elevations. Mechanical considerations. Details. How to keep plans within financial budget. Specifications. Illustrative example. Index.

Note: This book is both a text for practical students and a guide for those prospective homeowners who like to work out all the details of planning their own homes. Most aspects of the subject are at least touched upon, but the book is valuable chiefly for its wide range of information on structural details and the technical aspects of planning and construction. The first edition appeared in 1942. A fair amount of material has been added in this edition, especially on the currently popular single-story house and on recently developed materials. Three chapters have been dropped. The number of illustrations has been increased.

UNITED STATES FOREST PRODUCTS LABORA TORY

Manual on wood construction for prefabri cated houses. Prepared by The Forest Prod ucts Laboratory Forest Service U S De partment of Agriculture in collaboration with the technical staff of the Housing and Home Finance Agency Washington D C. Govern ment Printing Office, 1947 330 p. illus. 26 cm. $1.50. 5612

Contents: Introduction. Basic information on wood as a housing material. Factors affecting the use of wood in housing. Grades of lumber and plywood. Strength of housing materials. Protection of wood from decay, insects, fire. Paints and painting. Insulation and ventilation of houses. Seasoning and storage of housing materials. Machining of wood and other housing materials. Glues and gluing. Wood and plywood for specific parts of houses. Joints and fastenings. Prefabrication operations. Repair techniques. Glossary. Index.

Note: Intended primarily for the use of house designers, prefabricators, builders, contractors, engineers, and housing officials, this manual is a comprehensive illustrated guide and reference work on construction techniques for prefabricated houses of wood. It is based chiefly upon the accumulation of information resulting from studies in wood handling and processing conducted by the Forest Products Laboratory over a period of 36 years, supplemented by information obtained in a survey of current fabrication methods in prefabrication plants. It includes new contributions as well as basic information on the subject.

UNITED STATES FOREST PRODUCTS LABORA TORY

Technique of house nailing. By Forest Products Laboratory, Forest Service U S Department of Agriculture, in collaboration with the technical staff of the Housing and Home Finance Agency Washington, D C. Government Printing Office, 1947 53 p. illus. 23 cm. $0 15 5613

Contents: Introduction. Recommendations for nailing. Key to drawings. Figures 1–41. Sizes of common wire nails. Glossary of housing terms.

Note: This pamphlet presents information for home builders on correct nailing practice and gives precise specifications for nailing. Four pages of text are followed by forty-four pages of figures, each figure accompanied by brief descriptive notes. Each drawing illustrates a separate nailing problem in house construction, such as corner posts, studs, anchorage of studs to sill, floor openings, door openings, bevel siding. The drawings show clearly how many nails are advised, where they should be driven, and whether they should be directly nailed or "toenailed." The techniques illustrated are based upon engineering studies, testing, observation of nailing practices, and investigations conducted by the Forest Products Laboratory.

UNITED STATES HOUSING AND HOME FI NANCE AGENCY DIVISION OF HOUSING RE SEARCH

Plank-and-beam system for residential con struction. A guide and design manual for the application of the plank-and-beam system to the modern house for a better product at lower cost. Prepared as a staff project of the Division of Housing Research. Alan L. Win throp, project engineer Washington, D C. Government Printing Office, 1953 80 p. illus. 26 cm (United States. Housing and Home Finance Agency Division of Housing Re search. Construction aid 4) $0.45 5614

Note A practical book on carpentry divided into 53 lessons, illustrated with 767 drawings and diagrams. It is intended especially for the apprentice carpenter and also covers problems that arise in the work of the journeyman carpenter the foreman and the superintendent of construction work. Differences between editions are usually small. A new edition as published in 1958, 309 p., $3.50.

SIEGELE, HERMAN HUGO

The steel square. A practical treatment of the steel square and how it is used Chicago Frederick J Drake & Company, 1951 184 p illus 23 cm. $3 00 5602

Contents (abridged) Roof framing table. Square and circle. Polygons. Simple roof framing cuts. Framing hips and valleys. Irregular plan roof. Irregular pitch roof framing. Backing hips and valleys. Various roof framing problems. Hayfork hoods. Determining size of step. Service stairs. Rough horses. Hand railing. Winding and circular stairs. Concrete steps. Stair and other problems. Miter and squaring problems. Squares. Index.

Note The steel square is a versatile instrument, and few carpenters fully master it. This book, for all craftsmen who wish to extend their knowledge of the square, describes several hundred techniques in roof framing, stair layout, etc. For the most part, the descriptions are explicit and detailed. There are 463 figures, each one of which is tied in with the textual discussion.

SINGLETON, JACK

Manual of structural design. Third edition Topeka H M Ives & Sons, 1947 336 p illus 26 cm. $6 00 5603

Note A standard handbook of methods, formulae, and data which are useful to professional structural engineers. Although a considerable part of the material relates to steel, there is also much data on reinforced concrete, aluminum, and wood. The bulk of the information is in tabular form and relates to shapes, sizes, and weights of various structural members, universal beam tables, shear constants, bending and direct stresses, weights of building materials, etc. Formulae, worked examples, and the American Institute of Steel Construction structural specifications and code of practice are also included. In this edition the work has been enlarged by more than 100 pages to include new tables and revised specifications and properties of new structural steel shapes.

SLEEPER, CATHARINE, AND HAROLD R SLEEPER

The house for you to build, buy or rent illustrations by Henry Diamond and Lombard C Jones New York John Wiley & Sons Inc. 1948 313 p illus. 27 cm. $6 75 5604

Content Your house is your castle. Rent, buy or build? Rent—for a tryout. Renting snags. Rent—$ and sense. Architects' lingo. Buy—to your advantage. Blind buying. When can you buy and what can you spend? Shopping for your house. Know what you buy. Build—to feather your own nest. Build—but don't bungle. Tackling your house. Meet Mr Architect. Without benefit of architect. Money talks. Pick your site. Tailoring the house and lot. Architects' sign language. Types and styles. How to solve the puzzle—planning. Planning for sleeping—bedrooms, closets, bathrooms. Planning for feeding. Planning for work spaces and storage. Finishes. Designing the exterior. Keeping the gremlins out. What makes the house tick? Gadgets. Ready! Set! Go! Index.

Note A popular but fairly comprehensive guide to the planning and building of dwelling houses. Much of it deals with nontechnical subjects such as the arguments for and against home ownership and the advantages of employing an architect to plan and build a house but a fair share of it is given over to explaining, by means of numerous drawings and an easy text, the materials, construction methods, and equipment of small houses as they are built in the United States of America.

SLEEPER, HAROLD R

Building planning and design standards for architects engineers designers consultants, building committees draftsmen and students. New York John Wiley & Sons, Inc., 1955 331 p illus 30 cm. $12 00 5605

Contents. Small homes. Motels. Hotels. Bars, restaurants and kitchens. Schools. Gymnasiums. Theaters and auditoriums. Stadiums and grandstands. Shops and stores. Office buildings. Banks. Agricultural buildings. Air terminals. Bus terminals. Parking garages. Service stations. Railroad and trucking data. Fire stations. Hospitals. Doctors' offices. Dentists' offices. Churches and temples. Mechanical equipment.

Note A complementary work to the author's well known *Architectural graphic standards*. It provides additional design information on the kinds of structures which are named in the chapter titles quoted above. In his preface to this book, the author indicates that *Architectural graphic standards* is intended as the general book and this new title as the specific one. However, the information included in *Building, planning and design standards* is both general and specific. For instance, although the school chapter includes data on such general matters as walking distances for pupils, minimum site sizes and area requirements for recreation, it includes also such information as "Recommended heights of chalk rail above floor" and dimensions for desks and seats. A bibliography of sources and related works is included in each chapter. There is no volume index, a lack which will probably bother librarians more than architects.

STALEY, HOWARD RAYMOND

Semi fireproof construction. New York D Van Nostrand Company Inc. 1948. 327 p. illus. 24 cm (A technical series on building construction, Walter C. Voss, editor) $6.00. 5606

Contents Introduction. Starting the construction operation. Soils for foundations. Excavation and sheet piling. Pile foundations. Footing and foundation walls. Exterior masonry walls. Interior and special masonry work. Framing of floors and flat roofs. Pitched types of roof framing. Roofing. Interior work. Rigging and derricks. Industrial buildings. Index.

Note. A concise manual of building materials and construction methods currently employed in the United States of America, in buildings of types III, IV and V as defined by the American Iron and Steel Institute. A complete coverage of these fields is not provided, but the materials and methods described cover a wide range and are the more commonly used ones. There are many excellent drawings of structural details and also illustrations of selected power tools. The chief use of the book will probably be as a textbook in engineering colleges, but it can serve also as an elementary reference book in the building industry

SWANSON, WILLIAM ELMER

Log cabins. New York The Macmillan Company, 1948 207 p. illus. 21 cm. $2 95 5607

Contents Building procedure. Types of cabins. Selecting a location. Tools. Available timber on property. Clearing the site. Building preparation. Foundations. Walls. Roofs. Floors. Windows and doors. Porch and garage. Interior and exterior of cabin. Fireplaces. Water and sewage. Furniture. Care of cabin and grounds. Miscellaneous. Index.

Note A practical manual which is aimed particularly at amateurs who lack experience in building. All of the operations that come up in the construction of small log cabins and related structures, such as fences and cabin furniture, are covered simply and in explicit detail. There are about 200 illustrations.

TIMBER ENGINEERING COMPANY

Timber design and construction handbook. Prepared by Timber Engineering Company an affiliate of the National Lumber Manufacturers Association New York F W Dodge Corporation 1956 622 p. illus. 23 cm. $12 75 5608

Content Wood properties. Commercial lumber standards. Preliminary design considerations. Post-and-beam construction. Roof trusses. Arches. Special framing. Exterior structures. Plywood. Fabrication, assembly erection, and maintenance. Specification format. Reference data. Design standards. Glossary. Abbreviations of terms. Index.

aspects of the approach to the design of houses for strength discussed in this publication, with such modifications as experience shows are necessary should result not only in greater safety for occupants but through economical use of materials should also result in savings in cost of construction.

Wilson John Douglas, and S O Werner

Simplified roof framing. Second edition. New York. McGraw Hill Book Company Inc., 1948. 160 p. illus. 21 cm. $4.20. 5620

Contents: Roof terms, types, and principles. The gable roof. The hip roof. The intersecting roof. The unequal pitch intersecting roof. Special problems and cuts. Summary of roof information and basic layout principles. The steel square and its use. Index.

Note: Roof framing is a specialized branch of carpentry, but because most carpenters have occasionally to frame roofs they require general information on the subject. This book, primarily a vocational school textbook, is useful for self-instruction for both carpenters and home mechanics. It provides clear detailed descriptions, and there are 111 illustrations. The first six chapters are little changed from the first edition (1927) but the last two are new

BUILDINGS EQUIPMENT

Adlam, Thomas Napier

Radiant heating: a practical treatise on American and European practices in the design and installation of systems for radiant, panel, or infra-red heating, snow melting and radiant cooling, including step-by-step procedure, with typical problems solved by the application of simplified working data, charts and tables. Second edition, revised and enlarged. New York The Industrial Press, 1949 504 p. illus. 24 cm. $6.00 5621

Contents (abridged): Theory of heat radiation. Artificial heating related to bodily heat losses. The measurement of comfort. Temperature studies in radiant heated rooms. Radiant heating with ceiling panels. Radiant heating with floor panels. Wall, baseboard, electrical, and metal panels. Controls for radiant heating. Areas and surface temperatures of radiant heat panels. Determining panel pipe size, spacing and loop layout. Radiant cooling and air conditioning. Snow melting by embedded pipes. Step-by-step procedure in radiant heating design. Index.

Note: A comprehensive manual designed for architects and heating engineers in need of technical information relating to the design of radiant heating systems. The present edition is 32 pages longer than the first edition published in 1947. New material is found on the design and construction of ceiling, floor, and wall panels, and there are several new [illegible] charts. There is no bibliography.

Adlam, Thomas Napier

Snow melting. New York The Industrial Press, 1950. 224 p. illus. 23 cm. $4.50 5622

Contents (abridged): Feasibility and cost of removing snow by melting. Snow melting test data and test set-ups. Calculating the heat required for snow melting. Pipe friction and expansion in snow melting systems. Antifreeze solutions and their use in snow melting systems. Automatic controls for starting system as snow begins to fall. Air venting and flow adjusting. Snow melting systems applied to roads and driveways. Snow melting systems applied to sidewalks. Special and dual-purpose applications of snow melting. Costs to install and operate snow melting systems. Design procedure and charts for pipe sizing and spacing. Index.

Note: The use of embedded hot water coils and electric cables for melting snow on driveways and sidewalks was briefly discussed by the author in his work *Radiant heating* (see above). In this volume he provides detailed information regarding design, construction, installation and operating costs of such installations. These data, and the methods of calculating heat requirements, should be of value to anyone contemplating the installation of such a system, but the book is intended primarily for engineers. A considerable variety of systems already built and operating are described and illustrated.

Allen, John Robins, and others

Heating and air conditioning, by John R. Allen James H. Walker and John W James. Sixth edition. New York McGraw Hill Book Company Inc. 1946 667 p illus. 23 cm. $7.50. 5623

Contents: Heat and the properties of steam and air. Heat losses from buildings. Methods of heating. Gravity warm-air furnace heating. Radiators, convectors, and unit heaters. Fuels and boilers. Steam heating systems. Pipe, fittings, valves, and accessories. Steam piping. Hot-water heating systems. Automatic control. General and district heating—electric heating. Air and its properties. Principles of air conditioning. Ventilating and air-conditioning systems. Fans, filters, washers, and coils. The transmission and distribution of air. Cooling and dehumidifying apparatus. The cooling and dehumidifying load. The design of an air-conditioning system. Residence air conditioning. Unit air conditioners. Industrial air conditioning. Appendix. Index.

Note: This work is an established textbook for engineering college courses. In libraries it has proved useful also as a book that can be used by general readers as a source of information about heating and air-conditioning systems and apparatus. The presentation is technical, but since it is written for students who are beginning the study of the subject, the mathematics employed are simple, and the terminology is not difficult. This edition has not been completely rewritten, but new material has increased the number of pages by 74 over the fifth edition (1939) and several parts have been extensively revised.

American Society of Heating and Ventilating Engineers

Heating, ventilating air conditioning guide. Vol. 34 New York American Society of Heating and Ventilating Engineers 1956 1,696 p. illus. 24 cm. $12 00. 5624

Contents (abridged): Section I, Fundamentals: Terminology. Thermodynamics. Fluid flow. Heat transfer. Section II, Human reactions. Physiological principles. Air conditioning in the prevention and treatment of disease. Air contaminants. Section III, Heating and cooling loads. Heat transmission coefficients of building materials. Moisture in building construction. Heating load. Cooling load. Section IV Combustion and consumption of fuels. Automatic fuel burning equipment. Heating boilers, furnaces, space heaters. Chimneys and draft calculations. Section [illegible] Systems and equipment: Gravity warm air systems. Forced warm air systems. Steam heating systems. Hot water heating systems. Panel heating. Pipe, fittings, welding. Pipe and industrial insulation. District heating. Central systems for air conditioning. Air conditioning. Air duct design. Fans. Air cleaning. Refrigeration. Automatic control. Sound control. Electric heating. Section VI, Special systems. Industrial air conditioning. Industrial drying systems. Transportation air conditioning. Residential summer air conditioning. Schoolhouse heating and ventilating. Section VII, Instruments and codes. Catalog data section.

Note: A long-established and authoritative compilation of technical data and design information which is prepared for the guidance of engineers. It contains expositions of principles and design procedures, tabulations of engineering data, useful formulas, and descriptions of types of equipment. A new edition is published every year. Much matter is carried over from one year to the next, but in most years there are also important and fairly extensive revisions. There is always a substantial section of manufacturers' advertising.

Babbitt Harold Eaton

Plumbing. Second edition. New York McGraw Hill Book Company Inc., 1950 644 p. illus. 24 cm. $8.00. 5625

Contents: Elements of plumbing. Hydraulics and pneumatics. Water supplies. Pumps and storage tanks. Water-supply pipes in buildings. Hot-water, chilled-water, gas, compressed-air, and vacuum supplies. Interior fire protection. Design and layout of drainage pipes, vent pipes, and traps. Installation of drainage and vent pipes. Sewage and drainage pumps and drains. Valves, faucets, meters, and other appurtenances. Materials, dimensions, and types of pipes, fittings, and equipment. Bathroom, and lavatories and toilet-room fixtures. Bathing, kitchen, washing, and other fixtures. Water treatment and sewage disposal. Maintenance and repairs. Heating. Ap[illegible] plumbing: Glossary of plumbing terms.—Extracts from and references to standard specifications for plumbing materials and equipment.—Problems and drawings of incorrect plumbing for corrections. Index.

Contents Part I General characteristics and basic principles. Potential cost savings. Conventional framing vs. plank-and-beam. Limitations of the plank-and-beam system. Part II Designing the planking. Handling the planks on the job. Designing the beams. Insulation and condensation control. Appendix I Plank structural design. Appendix II, Beam structural design. Appendix III, Design of insulation for condensation control.

Note "The plank-and-beam system for the construction of floors and roofs in today's houses is uniquely adaptable to the modern design trends toward one-story structures, large glass areas, modular co-ordination, open-space planning, and, if desired, 'natural finish' materials. It is characterized by the concentration of structural loads on fewer and larger sized pieces than in conventional construction, resulting in rapid site assembly with fewer man-hours. Dual function of materials and the use of planks continuous over two or more spans result in further economy. The first part of the publication discusses the background, the advantages, and the disadvantages of the system. The second part is an engineering design manual outlining the principles involved, together with tables and graphs for the design and selection of members.

UNITED STATES NATIONAL BUREAU OF STANDARDS

Sound insulation of wall and floor constructions, prepared by the staff of the Sound Section Washington, D C Government Printing Office, 1955 66 p. illus 26 cm (United States National Bureau of Standards. Building materials and structures report 144) $0 40 5615

Contents Introduction. Location of building. Location of rooms within a building. Factors that control the transmission of sound through walls and floors. Homogeneous walls. Nonhomogeneous walls. Impact noises and methods of computing results. Masking effect. Maximum tolerable noise levels. Details of measurement of sound-transmission loss. Numbering of panels. References. Tables. Numerical index of test panels.

Note This report summarizes data on the sound transmission of door wall and floor constructions in dwelling houses and office buildings. The general principles of sound insulation are discussed, and the techniques found most effective by test are explained in detail by means of text and illustrations. The report supersedes *Building materials and structures report 17* (published in 1939) and its supplements (1940 and 1947) It covers the results reported in the earlier publications and adds later results up to March, 1954.

VOSS WALTER CHARLES

Fireproof construction New York D Van Nostrand Company Inc., 1948 286 p illus. 24 cm (A technical series on building construction, Walter C Voss, editor) $5 75 5616

Contents Introduction. Preliminary and incidental work. Rock excavation. Foundations. Structural frames. Floor systems. Erection of the structural frame. Exterior walls. Fireproofing and partitions. Interior finish. Roofing and sheet metal. Building services. Index.

Note. This volume will serve as a manual of good practice for the construction of fire resistant buildings, rather than as a comprehensive text on the subject. It describes some of the commonly accepted methods utilized in the construction of buildings classified as "first class" by the National Board of Fire Underwriters and the American Iron and Steel Institute. The book is well illustrated with diagrams and photographs, and each step in the construction process is discussed in the light of accepted practices, choice of materials, handling of materials, and organization of the job.

WALKER, FRANK R.

The building estimators reference book a practical and thoroughly reliable reference book for contractors and estimators engaged in estimating the cost of and constructing all classes of modern buildings. Twelfth edition—illustrated Chicago Frank R. Walker Company 1954 1,774 p illus. 17 cm $13.50 5617

Contents (abridged) Excavating, backfilling, soundings, well drilling, hauling, caissons, wood and concrete piles, sheet piling and bracing. Concrete breaking, pneumatic excavating, trucking, drilling and sand blasting. Concrete footings, foundations and retaining walls. Reinforced and architectural concrete construction. Concrete masonry Integral and membrane waterproofing. Brick masonry glass blocks. Rubble stone, cut stone, granite and terra cotta. Rough carpentry and timber framing, hardwood and wood block flooring, wood and trusses. Mill work and interior finish, wood stairs. Wallboard, insulation, sound deadening, building board and sheathing. Corkboard insulation, weather strips. Painting, varnishing and decorating, paper hanging. Glass and glazing, structural glass, metal store fronts. Lathing. Interior marble and structural slate. Tile floors, wainscoting and mantels, terrazzo and composition floors and base, rubber tile and linoleum floors. Sheet metal work. Steel and aluminum windows, screens, storm windows and light industrial doors. Structural iron and steel. Electric freight and passenger elevators. Heating and air conditioning, furnace, steam, hot water and vapor systems. Plumbing, sewerage and gas fitting, refrigeration. Electric wiring. Index.

Note. The first edition of this book was published in 1915 and it has been a standard manual in the building trades in the United States of America since that time. It covers the estimating of the quantities and costs of materials and the hours of labor and wages for projected building operations. The field is covered in detailed fashion for instance, there is information on such procedures as the hacking and chipping of old concrete which must be removed—not a building operation but one which enters into the cost of numerous building modernizations. Aside from its main use, the book is a source of information on the forms and dimensions of building materials. New editions are published frequently The scope and organization are not changed from one edition to another but some changes are always made so as to take account of changes in building methods, in wage scales, etc. The 14th edition was published in 1957 $13.50.

WAUGH, HERBERT R., AND NELSON L. BURBANK

Handbook of building terms and definitions New York Simmons-Boardman Publishing Corporation, 1954 421 p. illus. 20 cm. $5 00 5618

Note. A useful, reliable dictionary of terms used in the building trades in the United States of America. The authors took a liberal view of the boundaries of the field, hence, terms such as "motor" are included as well as "rubble." The definitions are written, for the most part, in the common language and are well phrased. A considerable number of illustrations are scattered through the text and, in addition, there is an appendix of symbols used in architectural drafting, drawings of pipe fittings, etc.

WHITTEMORE, HERBERT LUCIUS, AND OTHERS

Strength of houses application of engineering principles to structural design. By Herbert L. Whittemore, John B Cotter, Ambrose H. Stang, and Vincent B Phelan. Washington, D C. Government Printing Office, 1948. 132 p. illus. 27 cm. (United States. National Bureau of Standards. Building materials and structures report BMS 109) $1 50 5619

Contents Introduction. Outline of method for determining strength of houses. Dead load. Floor load. Wind load. Snow load. Water load. Assumptions. Conventions. Reactions on elements of house. Roof. Hip and valley rafters. Walls. Partitions. Floors. Weights of house constructions. Variations in strength of house constructions. Allowable loads on house constructions. Comparison of allowable loads with design loads for typical houses. Conclusions. Selected references.

Note. Methods for designing small houses to have adequate strength without waste of material are described and illustrated in this report, which applies engineering methods to house design. Fundamental data for wind, snow and floor loads are given, and convenient methods for computing applied loads are described. One purpose of the publication is to open the way for designers to introduce unconventional materials and unusual methods of fabrication by laboratory determination of strength of construction. Another is to indicate where careful engineering scrutiny shows superfluous quantities of material being used in houses constructed by traditional methods. The authors conclude as follows: "General

building materials. Preventing condensation on interior surfaces. Preventing condensation within walls and ceilings. Insulation and comfort. Sound insulation. Insulating farm structures. Index.

Note A practical book addressed to homeowners and farmers rather than to architects and contractors. Adequate descriptions of the types and varieties of insulating materials are given. Methods of application are also described, and in most instances the descriptions are detailed enough to serve the needs of readers who intend to apply the insulating themselves. However, methods which require specialized equipment are described in general terms only. An example is the blowing of loose insulation into the walls of existing buildings. The book contains little if any information that has not been published before, but it is a handy compilation for its intended readers.

DALZELL, J RALPH

Remodeling guide for home interiors planning, materials, methods. New York McGraw-Hill Book Company Inc. 1956. 345 p. illus. 24 cm. $4 95 5632

Contents: Wants. Fasteners. Insulation. Ceilings. Walls. Floors. Basements. Kitchens. Attics. Bathrooms. Storage spaces. Index. Bluepoints.

Note: This book deals with the repair and reconstruction of the interior of dwelling houses. It is directed to homeowners and amateur [illegible] more than to professional builders and is a combination [illegible] of the book and reference book of factual information on materials, construction details and techniques. The problems of remodeling are accomplished nevertheless, the book contains [illegible] wide range of useful information.

DAY LOUIS J

Standard plumbing details for architects, engineers, contractors plumbers and students. New York John Wiley & Sons, Inc., 1938 119 p. illus. 30 cm. $9.50 5633

Contents: Plumbing fixtures. Plumbing equipment. Plumbing systems. Plumbing layouts. Index.

Note. A collection of reproductions of diagrams whose purpose is to show how plumbing fixtures are connected. In some of the drawings dimensions of fixtures are also supplied, but in general they are omitted because the author expects that architects and engineers will obtain exact information on dimensions from manufacturers. The diagrams depict not only installations in dwelling houses, but installations in industrial, office, and public buildings.

DUNLAP MATTHEW ELBRIDGE

Condensation control in dwelling construction, by Forest Products Laboratory Forest Service, U S. Department of Agriculture in collaboration with the Division of Standardized Building Codes and Materials Office of the Administrator Housing and Home Finance Agency Washington D C. Government Printing Office, 1949 73 p. illus. 23 cm $0.25 5634

Contents Introduction Factors in the condensation problem. Vapor barriers. Sheathing paper or sheathing. Ventilation. Thermal insulation. Good practice recommendations. Condensation control zones. Sizes of ventilators. Closed spaces. Walls. Lofts or attics. Condensation control details. Appendices: Methods for computing recommended amounts of insulation. Literature cited. Glossary of condensation and heating terms.

Note How excessive condensation in the frames of dwelling houses may be controlled by means of vapor barriers and proper ventilation [illegible] the subject of this pamphlet. The methods described are based upon studies and observations made over [illegible] period of years on buildings involved in moisture problems. Pages 6–44 are occupied by drawings and specifications drawn by J C Killebrew showing various building details involved in condensation control. The publication is of interest to architects, builders, and home owners.

EMERICK, ROBERT HENDERSON

Heating design and practice. New York McGraw Hill Book Company Inc. 1951 453 p. illus. 24 cm. $9.00 5635

Contents. Terms and definitions. How heating loads are calculated. Designing [illegible] steam heating system. Heating boilers and steam generators. Designing [illegible] hot water heating system. Boiler firing equipment. Water heaters and how to size them. Designing [illegible] warm air heating system. Panels, baseboards, and unit heaters. Fans and district heating. Space heaters, domestic and industrial. District steam heating. The heat pump. Fuels and fuel handling. Combustion. Chimneys, stacks and flues. Heat insulation and refractories. Fireplace design and performance. How to choose [illegible] heating system. Incinerators and destructors. Specifications and the analysis of bids. Index.

Note. A practical, largely descriptive book for such readers as vocational-school students and men who design or install heating systems. Residential heating equipment such as is currently used in the United States of America is emphasized, but there is some discussion of larger equipment. A special feature is the inclusion of information on new developments such as the heat pump and panel heating. A range of data useful in practical design is included. There are many illustrations but no bibliography.

EWING CLAUDE H. AND HARRY A. HARRIS

Practical instruction for paper hanging complete textbook covering tools processes and elements for hanging paper on walls, ceilings and panels. Chicago Frederick J Drake & Company 1946 223 p. illus. 19 cm. $2 00 5636

Contents Paste table work and hanging sample patterns. Hanging special papers. Hanging paper around doors and windows. Hanging ceiling papers. Hanging panel paper. Preparation of surfaces.

Note Except for the final chapter, the instruction in this trade school text is given in the form of 63 practice jobs for the student to accomplish. Each such project covers [illegible] different phase of the paper-hanging process and includes, objectives of the job, preliminary information, equipment and handtools, materials, and procedures. A second edition [illegible] published in 1957 230 p. $3 00.

FAHSBENDER MYRTLE

Residential lighting. New York D Van Nostrand Company Inc. 1947 269 p. illus. 29 cm. $12.50 5637

Contents Part [illegible] Residential lighting equipment. The influence of period styling on lighting fixture design. Portable lamps and lamp shades. Designs and materials in portable lamps. Fluorescent lighting in the home. Lighting the rooms of the house. Home [illegible] wiring. Garden lighting. Christmas lighting. Part [illegible] Light and vision. Electrical and illumination terms. Light sources. Color and light in the home. Bibliography. Index.

Note Residential lighting, that is, the proper selection and placing of electric lamps and fixtures in [illegible] house so as to harmonize with the furnishings and to provide the correct amount and quality of illumination, is the principal subject of this manual book. The many excellent illustrations show indoor and outdoor lighting appliances, methods, and arrangements. About one-third of the text is devoted to an easily understandable treatment of technical details such as the various types of lamp bulbs and their uses, the properties of light, how to make minor repairs to wiring, etc. The work should be useful to homeowners, interior decorators, architects, and builders.

GAY CHARLES MERRICK AND OTHERS

Mechanical and electrical equipment for buildings. Third edition. By Charles Merrick Gay Charles De van Fawcett, and William J McGuinness. New York John Wiley & Sons Inc., 1955 564 p. illus. 22 cm. $8.50 5638

Contents (abridged) Water supply. Sanitation. Heating. Air conditioning. Electrical equipment. Acoustics. Appendix: Articles of the National Electrical Code. Supplementary textbook references. Index.

Note: A treatise on plumbing which is written on the engineering college level. The basic theory is covered in such chapters as that on hydraulics and pneumatics, but most of the space is given to descriptions of the elements of plumbing systems, and to practices which are in line with such codes as the *Plumbing manual* of the National Bureau of Standards and the *Housing code* of the Housing and Home Finance Agency of the United States Government. In connection with the descriptions of practices much engineering data are presented chiefly in the forms of graphs and tables. Although addressed more to sanitary engineers who will be responsible for the design of plumbing systems in public buildings, dwellings, etc., and to college students preparing for careers in sanitary engineering, than to practical plumbers, the book does include much information of value to the latter group. The first edition was published in 1928. In preparing this edition the author thoroughly revised the book and added more than 100 pages of material.

BARROWS, WILLIAM EDWARD

Light, photometry, and illuminating engineering Third edition. New York McGraw Hill Book Company, Inc., 1951 415 p illus 24 cm. $8 50 5626

Contents. Light and vision. Photometric standards, units, and nomenclature. Sources of light. Gas, vapor and fluorescent lamps. Principles of photometry and photometers. Photometric measurements and illumination surveys. Light-flux calculations and spherical photometry Principles of interior lighting. Illumination calculations and design. Light control and application. Interior lighting practice. Lighting for sports and recreation. Principles of street and highway lighting. Lighting streets, highways, and airways. Problems. Index.

Note An engineering college textbook with a venerable lineage. It traces back to the author's *Electrical illuminating engineering* published in 1908. However in counting editions the publisher has started with that published in 1925. Each new edition has usually represented an extensive revision of the preceding one, and the edition at hand is no exception. A considerable part is new or extensively revised in comparison to the preceding edition (1938) The book is now an introductory and fairly comprehensive treatment on the engineering-college level. A good share of the text is descriptive and practical. A fair grasp of the book's contents should prepare the reader to design common types of lighting systems.

BERRY, C HAROLD

Flow and fan—principles of moving air through ducts, elements of fan selection and control, duct arrangement and resistance, system characteristics and flow analysis, clearly stated for students or practicing engineers New York Industrial Press 1954 226 p illus 23 cm. $4 00 5627

Contents Factors in gas flow measurement. Pressure and loss calculations. Losses in straight uniform ducts. Losses in diverging passages. More about losses The system considered as a whole. Effect of flow and field. Fan performance. Effect of variables on fan performance. Fan and system. Selecting a fan. Fan selection and rating. Fan operation and control. Index.

Note The matter in this book is not only clearly stated as claimed in the title, but it is also written from the viewpoint of the engineer (not a specialist in fans and ventilation) who must select a fan or design a duct system for maximum performance and economy The various factors that may affect performance and efficiency are skillfully described, in most instances without the use of mathematics for instance A damper in a duct is strictly analogous to a resistance included in an electric circuit to control current flow Such a resistance dissipates work in warming the surroundings However mathematics, especially graphic methods, are used when necessary The contents of the book appeared originally as articles in *Heating and ventilating*

BOAST, WARREN B

Illumination engineering Second edition New York McGraw Hill Book Company Inc. 1953 340 p. 23 cm $7 00 5628

Contents The spectroradiometric function The luminosity function. The illumination system. Entities in the illumination system and their units. Measurement of illumination. Geometric graphs and their application. Determination of illumination from surface and line sources. Absorption, reflection, and transmission of luminous flux. Electric-light sources and their operating characteristics. Illumination standards. Lumen method of design of interior lighting systems using commercial luminaires. Illumination and brightness design by the interreflection method. Luminous architectural elements. Testing of illumination systems. Color specifications. Design of floodlighting systems—of street-lighting systems. Ultraviolet and infrared sources and applications. Wiring. Appendix. Index.

Note. A rigorous treatment of the scientific bases of illumination engineering. All the essentials for the design of efficient lighting systems are covered, but there are no illustrations of lamps or of lighting installations. The general scope and arrangement of this edition remains the same as in the 1942 edition, but the material has been revised to conform with latest illuminating standards. New chapters have also been added on the interreflection method of design color ultraviolet and infrared sources, and wiring standards. The author is Professor of Electrical Engineering in Iowa State College.

CARRIER, WILLIS HAVILAND, AND OTHERS

Modern air-conditioning, heating and ventilating, by Willis H. Carrier, Realto E. Cherne and Walter A. Grant. New York Pitman Publishing Corporation, 1950 574 p. illus. 26 cm. $10 00 5629

Contents: Introduction. Psychrometrics and comfort. Estimating requirements. Economics. Heat-producing equipment. Heat-distributing equipment. Steam heating systems. Hot-water heating systems. Automatic controls and sizing for heating. Fans, heaters, and collators. Air-cleaning devices and humidifiers. Design of air-duct systems. Cooling and dehumidification. Central and unit systems. Refrigeration systems and equipment. Refrigeration piping. Air distribution and sizing. Automatic controls for air conditioning. Noise and vibration. Application practice. Residential heating and air-conditioning systems. Appendix. Air-conditioning glossaries. Index.

Note. A standard treatment from the practical standpoint. It is suitable for use as a self-instruction text as well as a reference manual for practicing engineers, architects, and others in the field. The first edition was published in 1940. The most obvious change in the present edition lies in the improved format of the volume. The page size is larger and the typographical design of text, tables and charts is more pleasing. Revisions in contents include a new section on radiant and panel heating and expanded discussions of oil burners and air-cleaning devices, and the rewriting of the chapter on psychrometrics.

CLOSE, PAUL DUNHAM

Building insulation, principles and application of heat and sound insulation for buildings. Fourth edition Chicago American Technical Society, 1951 402 p. illus. 22 cm. $5 25 5630

Contents Introduction. Types of thermal building insulations. Methods of application. Fundamentals of heat transfer through building materials. Transmission coefficients and tables. Calculating heat losses. Effect of building insulation on heating plant size. Fuel saving. Economics of insulation Insulating efficiencies and expansion of roofs. Preventing condensation on interior surfaces. Preventing condensation within walls and ceilings. Insulation and comfort. Pipe and duct insulation. Sound insulation. Machinery isolation. Architectural acoustics and noise quieting Insulating farm structures. Appendix questions pertaining to building insulation. Index.

Note A standard reference book for the information of builders, engineers, architects, homeowners, etc. Also, it is used to some extent as a textbook in trade school courses. In it are discussed the various kinds of heat and sound insulating materials, their uses and methods of application, trade names, names of manufacturers and related topics such as the economics of heat insulation. The third edition was published in 1946. In this edition much of the text is unchanged, but important revisions have been made in such parts as the chapters on condensation and in the lists of manufacturers and trade names.

CLOSE PAUL DUNHAM

How to insulate homes and farm buildings. Chicago American Technical Society, 1952 204 p illus. 22 cm. $3 25 5631

Contents. Introduction. Types of thermal building insulations. Methods of application. Fundamentals of heat transfer through

KEMLER, EMORY NEUDECK AND SABERT OGLESBY JR.

Heat pump applications. New York Mc Graw-Hill Book Company Inc., 1950 300 p illus. 24 cm. $6.50 5644

Contents: Introduction. Commercial heat-pump installations. Industrial heat-pump installations. Residential installations. Thermodynamics of refrigerants and cycles. Heat-pump cycles. Heat sources. Compressors. Fans and ducts. Electric motors. Heat exchangers. Temperature and design data. Storage and hot-water [illegible]. Patent abstracts. Index.

Note: A technical survey of the status of heat pump engineering, especially in applications to commercial and residential heating, as of the year 1948. It [illegible] addressed to such readers as refrigeration and heating engineers. It is drawn partly from the literature and partly from the authors' own work in the field. Particular attention [illegible] given to describing the solutions which have been attempted to such problems as the capacity control of compressors under the conditions imposed on heat pumps in average installations. Short bibliographies are included in the chapters. The chapter on patents contains abstracts of 34 United States of America patents.

KNUDSEN VERN OLIVER AND CYRIL M HARRIS

Acoustical designing in architecture. New York. John Wiley & Sons, Inc. 1950 457 p. illus. 22 cm. $7.50. 5645

Contents: Properties of sound. How we hear. Speech and music. Reflection and diffraction of sound in rooms. Open-air theaters. Sound-absorptive materials. Special sound-absorptive constructions. Principles of room acoustics. Acoustical design of rooms. Noise control. Reduction of air-borne noise. Reduction of solid-borne noise. Control of noise in ventilating systems. Sound-amplification systems. Auditoriums. School buildings. Commercial and public buildings. Homes, apartments, and hotels. Church buildings. Radiobroadcasting, television, and sound-recording studios. Appendix: Coefficients of sound absorption. Tables of sound-insulation data. Conversion factors and physical constants. Index.

Note: A practical guide intended for architects, students of architecture, and others who wish [illegible] nonmathematical but comprehensive treatise on the subject. The authors cover the technological principles of architectural acoustics and show how to apply these principles [illegible] practice. They emphasize that acoustical designing begins with the preliminary sketches on the drafting board and continues throughout all stages of planning and construction. Design data are presented in such [illegible] manner that the book can serve as [illegible] convenient reference in the solution of most problems encountered in architectural acoustics.

KRAEHENBUEHL, JOHN OTTO

Electric illumination. Second edition New York. John Wiley & Sons, Inc., 1951 446 p. illus. 24 cm. $8.00 5646

Contents: Introduction. Objective specification of illumination. Subjective specification of illumination. Color and shadow. Illumination from point, line, and surface sources. Electrical incandescent and gaseous vapor-light sources. Light control. General illumination design (lumen method). Luminous architectural elements (lumen method). Floodlighting (lumen method). Novelty lighting. Maintenance and economy—automatic control. Wiring. Appendix. Index.

Note: A college textbook that is useful also to architects and other nonspecialists whose work requires the understanding of the principles of illumination and the specifications of lighting systems. Commercial, industrial, and theatrical, rather than residential, lighting, are dealt with. In addition to discussions of the general principles of the subject, there is [illegible] wide variety of tabulated engineering data useful in design and specification work. There are generous lists of references to other literature. The book has been rearranged, the type reset, and there is [illegible] substantial amount of new material in this edition.

MADISON RICHARD D., editor

Fan engineering. An engineer's handbook on air its movement and distribution in air conditioning, combustion, conveying and other applications employing fans. 5th edition, rewritten and reset. Buffalo Buffalo Forge Company 1948 808 p. 18 cm. $6 00 5647

Contents (abridged): Part I: Properties of air and air-vapor mixtures. Heat transmission. Fluid flow. Air distribution. Part II: Centrifugal fans. Axial flow fans. Laws of fan performance. Fan testing. Sound. Fan dynamics. Fan power equipment. The jet pump. Part III: Heating. Ventilation. Humidifying and dehumidifying. Cooling and refrigeration. Drying. Combustion and mechanical draft. Air cleaning. Exhausting and conveying. Part IV: Problems and selection of equipment. Multiblade ventilating fans. Centrifugal fans in industry. Axial flow fans. Heaters. Coolers. Air conditioners. Evaporative coolers. Air cleaning and humidifying. Appendix. General index.

Note: A standard handbook of information and engineering data on industrial fans and air flow. It is designed for engineers and other technically trained persons [illegible] who select fans for industrial uses or design systems in [illegible] which fans are employed to move air. In preparing the present edition the work was extensively revised. Greater attention is now paid to basic engineering, and [illegible] somewhat more comprehensive treatment of air conditioning has been incorporated. The numerous charts and tables have been revised and modernized [illegible] with new data [illegible] wherever possible. Selective bibliographies are included throughout the volume.

MANLY HAROLD PHILLIPS

Drake's heating, cooling and air conditioning handbook a reference manual and practical instruction book. Chicago Frederick J Drake & Co., 1947 758 p. illus. 19 cm. $4.00. 5648

Contents (abridged): Winter heating and summer cooling. Heat transfer. Evaporation and relative humidity. Psychrometric tables and charts. Heating and cooling loads. Ventilation, leakage, and moisture. Heating load calculations. Heating with hot [illegible] air. Heating with steam. Heating with warm air. Cooling loads and their calculation. Air filters. Air flow and pressure loss. Duct design and construction. Fan performance and selection. Oil burners. Gas burners. Coal stokers. Automatic controls. Radiant heating. Index.

Note: This book is intended for workers [illegible] who are engaged in the installation and maintenance of heating and air conditioning equipment. It presents [illegible] simplified, practical exposition. The computations introduced require only [illegible] knowledge of simple arithmetic.

MATTHIAS ARTHUR JOHN JR.

How to design and install plumbing materials and methods of standard practice. Revised by Esles Smith, sr Third edition. Chicago American Technical Society 1952 444 p. illus. 22 cm. $4.25 5649

Contents (abridged): Municipal sewage disposal. Private sewage disposal. Materials used for sewer pipe and fittings. Joints in clay and iron sewer-waste and vent. The house sewer. The house drain. House drain appliances. Storm drainage. Soil pipe. Waste pipe. Traps used on plumbing systems. Ventilation. Soil, waste, and vent pipe principles. Inspection and test. Water supply. Materials used for water distribution. The house water supply. Pumps and lifts. Cold-water distribution systems in tall buildings. Domestic hot water supply. Hot-water distribution systems. Cross-connections. Fire line installation. Plumbing fixtures. Questions pertaining to plumbing. Index.

Note: A practical book that has been widely used as [illegible] vocational school text and general source of information about plumbing practices since the appearance of the first edition in 1940. It covers both the plumbing of residences and of industrial buildings. A considerable range of material has been added in this edition. However, it is obvious that the revision was handled so that as many as possible of the plates that were used to print the second edition could be used again. The result has been the retention of some outdated material.

PAINTING AND DECORATING CONTRACTORS OF AMERICA

Painting and decorating craftsman's manual and textbook. New York Theo. Audel & Co., 1949 430 p. illus. (part col'd) 17 cm. $2.00. 5650

Note. A standard book on the fixed-in-place equipment of residential, office and industrial buildings. The field is covered from the standpoint of engineering, and one of the uses of the book is as a text in engineering schools. However much information is included which is useful also to architects, real estate operators and superintendents of buildings. A wide range of typical equipment is described, but the main emphasis is on principles, applications and capacities. The second edition was published in 1945. This third edition has been extensively revised and enlarged. New developments, such as electronically controlled automatic elevators for office buildings, are now included. Various sections have been revised to make them conform to the current edition of the National Electrical Code.

HAINES, JOHN E

Automatic control of heating and air conditioning New York McGraw Hill Book Company Inc., 1953 370 p illus 24 cm. $6 75 5639

Contents Fundamentals of control. Definitions. Fundamentals of measurement. Electric-control circuits. Pneumatic-control circuits. Electric-control units. Control of domestic heating. Zone control—commercial heating. Control of unit heaters and unit ventilators. Control of commercial central-fan heating systems. Control of commercial central-fan cooling systems. Control of commercial refrigeration. Control of radiant-panel heating. Index.

Note. A descriptive treatment of control problems and control devices used in connection with heating and air conditioning systems. The mathematical aspects of control ar not covered Instead, the space is devoted to the arrangements and mechanisms of variety of devices ranging from the simple house thermostat used to control the dampers f a coal-fueled furnace to the refined systems of thermostats and electrically actuated valves used in connection with large air-conditioning systems. The author is a Vice-President of the Minneapolis-Honeywell Regulator Company major manufacturer of controls f the kinds described, but there is no particular emphasis on the devices manufactured by this company Men associated with the heating and air-conditioning industries will find the book of particular interest.

HOLMES, RICHARD E

Air conditioning in summer and winter Second edition. New York McGraw Hill Book Company, Inc., 1951 352 p illus. 24 cm $6 00 5640

Contents Air conditioning and the atmosphere. Psychrometry Requirements for comfort. Air-conditioning systems. Winter air conditioning load—air-infiltration heat loss—heat-transmission loss—total heating and humidifying load. Heating systems. Humidifiers. Air filters. Application of winter air-conditioning equipment. Introduction to refrigeration principles. Refrigerants and refrigerant tables. Refrigeration systems. Compressors. Condensing equipment. Low-side equipment. Dehumidifiers. Field-assembled systems. Self contained air conditioners. Summer air-conditioning load. Application of summer air-conditioning equipment. Temperature and humidity controls. Index.

Note. A textbook and self-instruction book written for installers, maintenance men, salesmen and other persons who need an elementary practical treatment. The fundamentals of the subject are covered and typical apparatus is described The first edition was published in 1938. Many changes and additions were made in preparing this edition including somewhat more technical treatment f such topics as the refrigeration cycle.

HUTCHINSON F W

Design of heating and ventilating systems. New York The Industrial Press 1955 308 p illus. 24 cm. $7 00 5641

Contents. Introduction. Load determination—transmission losses—intermittent heating—ventilation and humidification—losses from ducts, pipes and tubes. Fuels and combustion Air distribution. Conventional heating system design procedure. Panel heating design procedure. Solar heating design procedur Appendix. Bibliography Index to graphs. Subject index.

Note: In preparing this book, the author gav little emphasis to, or ignored entirely aspects of heating and ventilating system design which have become standardized and, instead, devoted the space to matters such as the design of heating systems used in conjunction with solar heating. The chapter on solar heating design runs to 32 pages. Air distribution and panel heating design are two other topics treated at considerable length. Throughout, the book consists of two somewhat independent though interpaged parts, a concisely written text and series of charts. The text is for reading and instruction. The charts are designed to simplify computations. Each chart is printed on full right-hand page, while on the facing left hand page is an explanation of it and other information designed to facilitate its use. The book is of interest to graduate engineers, architects and others who design heating and ventilating systems for residences, schools and other buildings.

ILLUMINATING ENGINEERING SOCIETY

IES lighting handbook, the standard lighting guide. Second edition. New York Illuminating Engineering Society, 1952 977 p. illus. 23 cm. $8 00 5642

Contents: The physics of light. Light and vision. Standards, nomenclature, abbreviations, and symbols. The measurement of light. Color Light control. Daylighting. Light sources. Lighting calculations. Interior lighting. Exterior lighting. Sports lighting. Street and highway illumination. Aviation lighting. Transportation lighting. Miniature lamp applications. Photographic, reproduction, projection, television and radar screen lighting. Miscellaneous applications of radiant energy Appendix: Conversion factors for lighting units. Conversion equations for angular measure, temperature, power and pressure. Greek alphabet. Glare factors. Procedure for obtaining I.C.I. specifications from spectrophotometric curves. Central Munsell notations for each I.S.C.C.-N.B.S. color-name block. Tristimulus values of the spectrum. Brightness of various light sources. Procedure for computing coefficients of utilization. Constants for use in zonal method of computing luminous flux from candlepower data. Nomogram for determining angle of incidence. Nomogram for obtaining zonal lumens from average zonal candlepower. Constants for converting beam candlepower of projector-type luminaires into lumens. Coefficient of utilization computation sheet. Multiplying factors for direct components of utilization coefficients. Calculations with line and surface sources. Complete expense analysis. Equations of common curves. Areas of plane figures. Properties of the circle. Trigonometric formulas. Specular and diffuse reflection factors of common papers and ink. Manufacturers' data. Index.

Note. A manual which provides essential information on light and lighting in simple terms and condensed style for the practical use of engineers, architects, contractors, and manufacturers. This edition is the result f detailed review and revision of the first edition published in 1947 The work of revision was carried on largely by technical committees of the I.E.S. Over three-fourths of the material is new or revised. Two new sections are included, those on street and highway illumination and iation lighting. A feature is the 173-page section of manufacturers' reference data containing data from 85 manufacturers on products supplied by them, the contents of which comply with the specifications and standards established by the Illuminating Engineering Society for such information.

JENNINGS, BURGESS H.

Heating and air conditioning Scranton International Textbook Company 1956 598 p. illus. 24 cm. $8.50 5643

Contents. Basic concepts and instrumentation. Thermodynamics and steam and gas properties. Air and humidity calculations. Heat transfer and transmission coefficients. The heating load. Principles f steam heating. Piping and steam-system design. Hot water heating. Heat-transfer elements. Boilers, fuels, and combustion. Warm air heating. Fluid flow duct design, and air-distribution systems. Fans and air distribution. Physiological reactions to heating and cooling. The cleaning of air Panel (radiant) heating Cooling load and air-conditioning calculations. Refrigeration and the heat pump. Controls and control systems. Index.

Note. A college textbook designed for the instruction of advanced undergraduate students of heating and entilating engineering. It provides reliable introduction to contemporary practice in the United States of America in residential and small-scale industrial heating and ventilating. Both equipment and design are covered. Although some attention is paid to summer air conditioning, especially the calculation of cooling loads and other design aspects, the primary objects are winter heating and associated control of the humidity and cleanness of the air within buildings. The author is Director of Research, American Society of Heating and Airconditioning Engineers.

Trane Company

Trane air conditioning manual. Revised edition. LaCrosse Wis. The Trane Company 1955 380 p. illus. 28 cm. $6.50. 5657

Contents. Heat. Comfort. Heat gain. Properties of air and the psychrometric chart. Calculations for the conditioned air supply. Refrigeration for air conditioning. Water for air conditioning. Ducts and fans. Reference tables. Answers to problems. Index.

Note: A well-written practical textbook. It covers both the science the basis of air conditioning and the technology of air conditioning equipment. It is written in a direct, elementary style in which the symbols and terminology of the subject are freely used. A considerable range of reference information is embodied in the text and, in addition, there is a 72-page section of tables of engineering data. Although published by one of the leading manufacturers in the United States of America of equipment for air conditioning, there is no emphasis on the equipment made by this manufacturer. The first edition was published in 1938, and there have been many reprintings and three revisions.

Wilkes, Gordon Ball

Heat insulation. New York John Wiley & Sons, Inc., 1950. 224 p. illus. 21 cm. $6.00 5658

Contents: Purpose of heat insulation. Fundamental terminology. Methods of determining heat transfer coefficients. Factors affecting the coefficient of thermal conductivity. Types of insulating materials. Reflective insulation. Specific heat of insulating materials. Moisture in insulation. Economics of insulation. Appendix: Coefficients of thermal conductivity. Specific heat and thermal diffusivity. Emissivity and reflectivity of various substances. Coefficients of heat transmission for building walls. Calculated U values. Water-vapor permeability of various materials. Bibliography. List of figures. Index.

Note: A compact summary of useful information on various aspects of heat insulation. The information included has application not only to the insulation of dwelling houses but to the insulation of refrigeration storage rooms and other structures where the insulation demands are more severe. The book is particularly valuable for the data it provides on such topics as reflective insulation, the effects of moisture, and the control of water vapor.

CONCRETE

American Society for Testing Materials

Significance of tests and properties of concrete and concrete aggregates a resume of present information on the significance of the properties of concrete and concrete aggregates and the tests by which they are studied and determined. Philadelphia American Society for Testing Materials, 1956 387 p. illus. 23 cm. $6.00. 5659

Contents: Part I, General. Concrete and concrete aggregates: Techniques, procedures and practices of sampling, by C. E. Proudley. Size and number of samples and statistical considerations in sampling, by W. A. Cordon. Evaluation of test results, by H. A. Frank. Needed research, by A. T. Goldbeck. Part II, Tests and properties of concrete. Freshly mixed concrete. Uniformity segregation and bleeding, by I. L. Tyler. Dimensions and unit weight, by M. A. Swayze. Workability and plasticity by F. Hubbard. Setting time, by E. W. Scripture. Air content, by F. F. Bartel. Hardened concrete: Petrographic examination, by K. Mather. Static and fatigue strength, by C. E. Kesler and C. P. Seiss. Elastic properties, by L. W. Teller. Dynamic tests, by E. A. Whitehurst and W. E. Parker. Volume changes and creep, by G. W. Washa. Thermal properties, by L. J. Mitchell. Pore structure, by G. J. Verbeck. Bond with reinforcing steel, by H. J. Gilkey. Abrasion resistance, by R. L. Kennedy and M. E. Prior. Resistance to weathering, general aspects, by C. H. Scholer. Resistance to weathering, freezing and thawing, by T. C. Powers. Resistance to chemical attack, by L. H. Tuthill. Resistance to fire and radiation, by P. H. Petersen. Air content and unit weight, by S. B. Helms. Cement content, by H. F. Kriege. Special categories. Ready-mixed concrete, by S. Walker. Lightweight concrete and aggregates, by R. E. Davis and J. W. Kelly. Part III, Tests and properties of concrete aggregates. Concrete aggregates: Petrographic examination, by R. C. Mielenz. Grading and surface area, by W. M. Price. Shape, surface texture and coatings, by B. Mather. Weight, density absorption and surface moisture, by A. G. Timms. Porosity and absorption, by D. W. Lewis and W. L. Dolch. Toughness, hardness, abrasion, strength, and elastic properties, by B. G. Woolf. Thermal properties, by H. K. Cook. Chemical reactions, by W. Lerch. Soundness and deleterious substances, by D. L. Bloem. Part IV Tests of properties of other materials. Other materials: Water for mixing and curing concrete, by W. J. McCoy. Curing materials, by J. H. Swanberg. Air-entraining admixtures, by C. E. Wuerpel. Mineral admixtures, by H. F. Meissner.

Note: A report composed of the individual papers whose authors and titles are listed above. Taken together these papers constitute an authoritative and useful survey of the various tests for concrete and of the properties of concrete and its ingredients except cement. Literature references are included in the individual papers.

American Society for Testing Materials

Symposium on use of pozzolanic materials in mortars and concretes, presented at the first Pacific Area national meeting of the American Society for Testing Materials San Francisco, Calif October 10–14 1949 Philadelphia American Society for Testing Materials 1950 203 p. illus. 23 cm. (American Society for Testing Materials. Special publication no. 99) $2.50. 5660

Contents: Introduction, by T. E. Stanton. Pozzolanic materials and their use in concrete, by R. E. Davis. Pozzolans used in mass concrete, by H. S. Meissner. Experience with pozzolanic materials in Kansas, by C. H. Scholer and R. L. Peyton. Effect of calcination on natural pozzolans, by R. C. Mielenz and others. Effect of the use of diatomite treated with air-entraining agents upon the properties of concrete, by R. E. Davis and A. Klein. Summary of methods for determining pozzolanic activity by W. T. Moran and J. L. Gilliland. Strength, volume change and sulfate resistance of mortars containing portland-pozzolan cements, by R. E. Davis and others. Studies of some method of avoiding expansion and pattern cracking associated with the alkali-aggregate reaction, by W. C. Hansen. Studies of use of pozzolans for counteracting excessive concrete expansion resulting from reaction between aggregates and alkalies in cement, by T. E. Stanton.

Note. Most of the papers in this volume relate to work done in the western and middle western states of the United States, particularly California, Colorado, Kansas, and Illinois. The first presents a general review of present-day knowledge of pozzolans, their effect upon some of the properties of concrete, and their use in concrete construction. The papers that follow deal in more detail with various aspects of the topic. Most of them contain bibliographies.

Bauer, Edward Ezra

Plain concrete. Third edition. New York McGraw Hill Book Company Inc., 1949 441 p illus. 24 cm. $7.50. 5661

Contents: Part I: Introduction. Standard Portland cement. Special cements. Mineral aggregates, admixtures, and water. Theories of proportioning. Applied proportioning. Factors affecting concrete strengths. Making of concrete. Placing, finishing, and curing concrete. Durability workability and watertightness. Field control of concrete. Specifications. Sampling. Testing. Part II: Instructions for performance of laboratory tests. Appendices. Index.

Note: A standard engineering college textbook on plain (as contrasted to reinforced) concrete. It is a combination of descriptive material and fundamental engineering information. The descriptive matter gives the book some value as a general reference book on the subject for homeowners, small contractors, etc. In the present edition, a considerable part of the older matter has been revised, and many new illustrations have been added. Revised specifications have been substituted for those which have been superseded.

Blanks, Robert F and Henry L. Kennedy

The technology of cement and concrete. Volume 1 Concrete materials. New York

Contents (abridged) Book I, Materials Composition and properties of basic materials. Synthetic resins. Modern paint formulations. Other basic coatings and finishes. Book II, Brushes, equipment, safety health Brushes and bristles. Spray painting. Ladders, scaffolds and rigging. Mechanical appliances. Health. Book III Painting specifications—practical procedure: Preparation of the surface, New exterior work. New interior work. Refinishing previously coated surfaces. Practical painting procedure. Marbleizing and graining. Wood finishing. Book IV Paint failures and their remedies: Factors that cause paint failures. Seasons for painting. Book V Color Color harmony Color mixing and matching. Color and light. Psychology of color. Styling with painted color Book VI, Wallpaper. Book VII, Estimating. Book VIII, Dictionary of trade terms. Book IX, Historical supplement.

Note. An official textbook of the sponsoring organization. It is designed for the instruction of apprentices who are learning the trade by combining classroom study with practical work. The discussions of some topics are rather brief, probably because they are intended to be supplemented by the personal instruction but as whole the book offers a wide range of practical information on materials and techniques. It should be useful not only to apprentices but to anyone who desires practical information about painting. It is patterned on *Painting and decorating working methods*, 1932, but it has been so thoroughly revised and expanded that it is essentially a new work.

PLUM, SVEND MUNK

Plumbing practice and design New York John Wiley & Sons, Inc , 1943 2 v illus 23 cm. $7 00 per vol. 5651

Contents (abridged) Volume I Corrosion. Materials. Pipes and fittings. Valves and controls. Fixtures and accessories. Pumps. Fire protection. Air piping and equipment. Appendix. Index. Volume II Definitions of physical and chemical terms. Codes and regulations. Architectural practice. Pipe work. Water supply Water piping. Drainage. Sewers. Sewage disposal and treatment. Gas piping and appliances. Water heating. Index.

Note These two volumes consolidate the data on the subject of plumbing, and present in uniform terminology the technical material scattered through architectural, mechanical, sanitary and civil engineering literature. The material is organized, terms defined, and the whole presented in handbook form. Default procedure and information are given on design of various pipe systems, equipment hook-ups, etc. Specifications are included only where they aid in describing particular mode of installation. Principles are thoroughly explained, and the data given are supplemented by numerous tables and drawings.

RABER, BENEDICT FREDERICK, AND FRANCIS W HUTCHINSON

Panel heating and cooling analysis. New York John Wiley & Sons, Inc., 1947 208 p illus 22 cm. $5 00 5652

Contents Introduction. Types of heating panels. Advantages of panel heating and cooling. Disadvantages of panel heating and cooling Radiation equations. The comfort relationship. The mean radiant temperature. Evaluation of shape factor planar surfaces. Evaluation of shape factor the human body Evaluation of shape factor approximations and examples. Heat-balance equations. Simplified heat-balance equations. The equivalent conductance design procedure. Index.

Note A valuable addition to the literature of panel, or radiant, heating. The book contains three fairly distinct although complementary parts In the first, the advantages and disadvantages of this method of heating and cooling are discussed in learned but non-technical terms in the second, the design of heating and cooling panels is analyzed mathematically and in the third, somewhat simpler procedures for design are presented. Except for the first part which may be read by anyone who is interested, the work is definitely for persons with previous training in mathematics and engineering. It is not intended for the practical installer of heating systems and such topics as boilers, furnaces, controls, or even the practical construction of panels, are not treated.

SEVERNS, WILLIAM HARRISON, AND JULIAN R. FELLOWS

Heating, ventilating and air-conditioning fundamentals Second edition. New York John Wiley & Sons Inc. 1949 666 p illus 24 cm. $7 00 5653

Contents (abridged) Essential definitions, laws, and properties of various media. Psychrometric properties of air—humidification and dehumidification. Factors affecting human comfort. Heat transmission and heat losses from buildings. Heating with warm-air furnaces. Heating boilers and appurtenances. Heating with steam. Heating with hot water Panel heating. Air conveying and distribution, fans, duct design, and diffusion. Ventilation and air purification. Mechanical refrigeration—applications to cooling and heating. Estimation of cooling loads. All-year air-conditioning methods and equipment. Automatic controls—pressure, temperature, and humidity Appendix. Index.

Note. Primarily this work is an engineering college textbook. Besides its textbook use, it has some value as a reference book for such persons as heating contractors, architects, and engineers. For this audience it provides concise and authoritative descriptions of modern design procedures and typical present-day heating and cooling equipment. Very substantial changes, including a large amount of newly added material, appear in this second edition.

SHARP, HOWARD M

Introduction to lighting New York Prentice Hall, Inc., 1951 334 p illus. 22 cm. $5.50 5654

Contents Nomenclature. Basic concepts. Electric lamps. Ballasts, transformers, and starters. Control of light. Luminaries. Measurements of light and lighting. Candlepower distribution curves. Coefficients of utilization. Principles of lighting design. Vision. Offices and schools. Factories. Stores. Lighting design—specialized techniques. Lighting cost analysis. Index.

Note A practical book suitable for engineering college students and practicing engineers who desire only a working knowledge of lighting principles and design. A good deal of the text is descriptive, but the mathematics that might be needed by practicing engineer or architect in designing lighting systems is included. The chapters are supplemented by literature references. There are a large number of illustrations and numerous tables of engineering data.

SHOEMAKER, RICHARD WOOLSEY

Radiant heating, including cooling and heat pump applications Second edition. New York McGraw Hill Book Company, Inc., 1954 346 p illus. 24 cm. $8 00 5655

Contents. General considerations. Structural and other advantages. Examples of commercial application. Examples of residential application. The radiant heating plant. Control systems for radiant heating. Design of radiant heating systems. Installation of radiant heating systems. Radiant cooling including heat-pump applications. Electrical applications. Miscellaneous applications. Precise method of designing radiant heating systems. Appendix. List of symbols. Index.

Note A useful survey of method of heating which has gained considerably in popularity in recent years. In it, the basic science is explained briefly and nontechnically and numerous examples of residential and commercial applications are illustrated and discussed. Typical equipment is shown. Except for the final chapter the treatment is descriptive and in the most difficult passages only semitechnical. The book is addressed primarily to such readers as architects, builders, and homeowners. However, the chapter on design is intended for heating engineers. The first edition was published in 1948. There are two new chapters in this second edition, and enough material has been added in chapters carried over to make a total of about 70 pages. Revisions have been made in both text and illustrations.

SPORN PHILIP *AND OTHERS*

Heat pumps by Philip Sporn E R Ambrose and Theodore Baumeister New York John Wiley & Sons Inc. 1947 188 p. illus. 22 cm $5 50 5656

Contents Thermodynamic principles. Basic heat-pump designs. Design factors. Equipment design. Equipment selection. Defrosting cycle and system control. Industrial applications. Economics of the heat pump Its effect on the power-system load curve. Heat-pump installations. Index.

Note. The heat pump is reversible refrigeration system arranged so that it can be employed for either cooling or heating. This book is essentially a survey for engineers and technicians, although the interested layman will find that he can grasp most of the exposition.

Contents: General considerations. Physical properties of materials used for prestressed concrete structures—steel—concrete—deformations. Theory of design of prestressed structures—changes of tension and stresses in prestressed structures due to shrinkage and plastic flow—method of design—Illustrative problems—prestressed trussed beams—Illustrative problems—prestressed trussed girders—prestressed shells—Illustrative problems. Representative prestressed structures. Appendix. Index.

Note: The heart of this book is the 130-page third chapter, in which the design of prestressed concrete structures is presented in practical manner for the use of graduate engineers. The two preliminary chapters present background information, and the final chapter contains illustrations and descriptions of prestressed concrete structures of various types, such as bridges, domes, and tanks. There are 130 figures and occasional footnote references to the source literature, mostly German.

LARGE, GEORGE ELWYN

Basic reinforced concrete design a problems method approach. New York The Ronald Press Company 1950. 340 p. illus. 24 cm. (*A volume of a series in civil engineering* Advisory editorial committee Lorenz G Straub and others) 5669

Contents: Introduction. Beams. Bond, shear, diagonal tension and anchorage. Columns. Continuity Buildings—design of beams and girder floors. Two-way and flat slab floors. Footings. Appendix. Index.

Note: An introductory textbook for college students of civil engineering which is organized for easy comprehension. In most of the chapters terms such as "bending moment" are explained concisely but clearly, and the definitions are followed by a series of worked examples of typical problems in reinforced concrete design. Problems for students to solve also are included. The illustrations include portraits of engineers who have made substantial advances in reinforced concrete design. A second edition was published in 1957 [illegible] p. [illegible]

LIN T Y

Design of prestressed concrete structures. New York John Wiley & Sons, Inc., 1955 456 p. illus. 24 cm. $11.50. 5670

Contents: Introduction. Materials. Prestressing systems—end anchorages. Loss of prestress—friction. Analysis of sections for flexure. Design of sections for flexure. Shear, bond, bearing. Beam deflections and cambers. Partial prestress and non-prestressed reinforcement. Continuous beams. Slabs. Tension and compression members. Circular prestressing. Allowable stresses and load factors. Economics. Special problems. Appendixes: Definitions, notations, abbreviations. Design data for some prestressing systems. Constants for beam sections. Criteria for prestressed-concrete bridges. Index.

Note: In the United States of America, prestressed concrete has made headway more slowly but it has gained sufficiently in acceptance to justify the publication of a book based on American engineering principles. This new work by Professor Lin of the University of California is such a book. Graduate American civil engineers who are familiar with design in plain and reinforced concrete are the intended readers. Primarily about practical design, it expounds methods adapted to American engineering, covering both elastic and ultimate designs. It includes in addition a good deal of useful "know-how" on such matters as the transport of precast prestressed concrete members and the application of loading to prestressed structures. Tensioning devices and anchorage hardware are described and illustrated, and other special aspects, such as the resistance of prestressed concrete to corrosion and fire, are discussed. Well-selected lists of literature references are included.

NATIONAL RESEARCH COUNCIL HIGHWAY RESEARCH BOARD

Curing of concrete, 1925–1955 a bibliography Washington, D C. National Academy of Sciences—National Research Council 1956 98 p. 28 cm. (National Research Council. Publication 430. Highway Research Board. Bibliography 18) $1.80 5671

Contents: Foreword. Significance of curing. General. Effects of curing on the properties of concrete. Theory of curing. Chemical aspects. Physical aspects. Factors affecting curing: Temperature. Time. Moisture. Miscellaneous. Curing practice—methods of curing: Field curing. Plant curing. Cold weather curing. Special curing methods. Comparison of methods. Miscellaneous. State practice: United States of America. Foreign. Curing specifications. Curing equipment (including laboratory). Miscellaneous. Author index.

Note: This bibliography for engineers, technicians, and research men concerned with concrete highways, is organized into five main and many subordinate subject groupings, as noted in the above contents. The pertinent literature of the United States of America and of Canada is covered comprehensively and that of other countries selectively. After each of the 518 listed articles appears an annotation that describes the contents of the article.

PARKER HARRY

Simplified design of reinforced concrete. New York John Wiley & Sons, Inc., 1943 249 p. illus. 20 cm. $4 75 5672

Contents: Materials. Proportioning and mixing. Shear and bending moments in beams. Formulas for bending. Shear and bond stresses. Design of rectangular beams. Design of T-beams. Beams reinforced for compression. Reinforced concrete floor systems. Reinforced concrete columns. Foundations. Retaining walls. Miscellaneous members. Index.

Note: This book confines itself to simple, succinct explanations. The treatment is not intended to be exhaustive. It covers only the most common structural elements in both plain and reinforced concrete design. Enough of the theory is given to make sure that the reader has a thorough knowledge of the essential principles involved. Only the basic formulas are derived. The usual tables needed in the design of reinforced concrete are included.

PEABODY DEAN

The design of reinforced concrete structures. Second edition. New York John Wiley & Sons, Inc., 1946 532 p. illus. 22 cm. $6.50 5673

Contents: General principles. Rectangular beams. Slabs with one-way steel. Shear bond, anchorage and diagonal tension. Rectangular beam design. Rectangular beams reinforced with tension and compression steel. The beams. Deflection and torsion. Shrinkage, flow and prestress. Two-way and flat slabs. Columns. Footings and retaining walls. The reinforced concrete structure. The structure as rigid frame. Arches and rigid frame bridges. Appendix. Index.

Note: The first edition was prepared for use in a course given at the Massachusetts Institute of Technology. The special feature of the book is that the discussion has been purposely made full, so that the student will not have to take notes while listening to lectures. This fullness of treatment makes the book suitable also for home study and for use as a reference book. A number of important changes have been made in this edition. A plastic theory of design is presented as an alternate to older theory. New material has been added on prestressed concrete, and on the design of forms. Discussions and designs have been revised to conform to the American Concrete Institute's *Building regulations for reinforced concrete*, Detroit, 1941, or the Joint Committee on Standard Specifications for Concrete and Reinforced Concrete's *Recommended practice and standard specifications*, Detroit, 1941.

SUTHERLAND HALE, AND RAYMOND C. REESE

Introduction to reinforced concrete design. With chapters on concrete by Inge Lyse. Second edition based on the first edition by Hale Sutherland and the late Walter W Clifford. New York John Wiley & Sons, Inc., 1943 559 p. illus. 23 cm. $6.50. 5674

Contents: Introduction. Concrete materials. Designing concrete mixes. Manufacture of concrete. Properties of concrete. Forms. Beams. Compression members. Formulas, diagrams, and tables. Retaining walls. Highway bridges. Continuous beams and rigid frames. Building design—individual members. Problems in rigid frame design. Foundations and footings. Slab construction: ribbed, two-way flat, and stair slabs. Example of building design. Check building design by rigid frame analysis. Lateral loads on frames. Arches. Plans and details. Economy in design. Appendix. Index.

John Wiley & Sons, Inc. 1955 422 p illus. 24 cm $11 75 5662

Contents. Part I, Introductory Part II, Cementing materials and admixtures Portland cements. The manufacture of Portland cement. Pozzolanic cements. Other hydraulic cements. Additions and admixtures. Part III, Concrete aggregates. Concrete aggregate materials. Geology and petrography of concrete aggregates. Effect of aggregate properties on concrete. Prospecting, exploration, sampling, and testing for concrete aggregates. Processing concrete aggregates. Index.

Note. The first volume published of a two-volume survey of the accumulated technical knowledge on concrete and its ingredients. It states the facts about the types and properties of cement and presents a thorough discussion of aggregate materials from the standpoint of their use in concrete. The manufacture of Portland cement is described. An unexpected feature is the inclusion between Chapters II and III of a nine-page directory of Portland cement manufacturing and distributing plants in the United States of America, Canada, Cuba and Mexico. Also included are technical descriptions of special cements such as antibacterial cement, and special concrete mixes, such as air-entrained concrete. Selected literature references are given. The book will be of interest to specialists in concrete, civil engineers concerned with concrete specifications and masonry contractors operating on a large scale. The second volume will deal with properties and uses of concretes produced by different combinations of basic ingredients, in other words with the uses and products of various mixes.

Boguslavsky, Boris W

Design of reinforced concrete. New York The Macmillan Company, 1956 428 p illus. 24 cm. $7 50 5663

Contents: Reinforced concrete. Structural analysis. Beams. Bond, shear and diagonal tension. Columns. Two-way and flat slabs. Footings. Retaining walls. Bridge arches. Prestressed concrete beams. Maximum moments in building frames. Design of a building. Appendix. Index.

Note. Designed both as a textbook for use in engineering college courses and a manual for practicing engineers, this book has several features that justify recommending it to graduate engineers. It is well organized, clearly written, and comparatively short. In addition to basic matter it contains a large number of useful formulas and practical design methods, some of which are new and some of which have been published heretofore only in professional journals. It contains also lucid discussions of such matters in engineering design as allowance for loss of prestress in prestressed concrete. The expository text includes a fair number of fully worked examples and a generous number of diagrams.

Collins, F Thomas

Manual of precast concrete construction. Fourth edition San Gabriel Calif The author 1955 102 p illus. 28 cm. $12 50 5664

Contents Brief review of history Flat cast vs thin shell. Patents. Casting surfaces and molds. Bond breaking Painting precast concrete. Construction schedule Field layout. Forms. Panel fabrication. Joinery Erection. Costs. Sandwich type panel construction. Addendum.

Note. Bearing on the cover the title *Manual of tilt up construction* this work is an informal but detailed and practical description of current techniques of constructing buildings of reinforced concrete wall panels which are cast in a horizontal position—often on the floor of the building under construction—then tilted into position. The history of this method of construction and the United States patents covering it are outlined in the first three chapters. The remainder of the book is devoted to concisely written textual descriptions and many illustrations. Many of the illustrations are reproductions of photographs showing buildings being constructed by the tilt-up method. Others are informal cartoon type drawings that "give the idea" of specific technical points. A three-page bibliography is included. A complementary book *Design of tilt-up buildings,* written by the same author and published by Know How Publications, San Gabriel, California, was issued in 1957 159 p., $17.50.

Cross, Hardy, and Newlin Dolbey Morgan

Continuous frames of reinforced concrete. New York John Wiley & Sons, Inc., 1932 343 p illus 23 cm. $7 50 5665

Contents Introduction. Statics of deflected structures. Geometry of deflected structures. Moment distribution. Haunched beams. Continuous girders—maximum moments, shears and reactions. Rigid frames. Influence lines—graphical construction. Rigid arches of reinforced concrete. Index.

Note. This is not a book on design, but a development of a single fundamental, geometrical method of moment and shear distribution in analyzing statically indeterminate structures, particularly of reinforced concrete. The text applies almost equally well to steel structures. A special effort has been made to help the engineer to picture deformations, numerous diagrams being employed for that purpose. Throughout the book, effective use is made of figured expressions in the form of graphs, diagrams, tabular and partly tabular-partly graphic presentments. The book is notably free from difficult mathematics.

Dalzell, James Ralph, and Gilbert Townsend

Concrete block construction for home and farm. Illustrations by Arthur E. Burke. Chicago American Technical Society 1952 216 p illus. 22 cm 5666

Contents. Mortar types, properties, and uses. Concrete characteristics and mixing. Concrete formwork. Design and construction of footings. Foundations and waterproofing. Concrete masonry Index.

Note. A simple manual for farmers and other persons who desire practical information on the building of farm buildings, dwelling houses, and other small structures of concrete blocks. It is based on the authors' more comprehensive *Masonry simplified,* Chicago, 1948 2 v The numerous illustrations include reproductions of many drawings showing structural details in three dimensions. Specific information is given on proportioning mortar waterproofing, etc., as well as on laying up the blocks. A second edition was published in 1957 216 p., $3.60

Dunham, Clarence W

The theory and practice of reinforced concrete. Third edition New York McGraw Hill Book Company Inc. 1953 499 p. illus. 24 cm. (McGraw Hill civil engineering series Harmer E Davis consulting editor) $7.50 5667

Contents Properties and manufacture of concrete. Beams subjected to bending. Bond. Shear and web reinforcement in beams. Composite beams. Columns. Combined bending and compression. Retaining walls. Footings. Large slabs. Forms. Precast concrete. Prestressed concrete. Architectural and miscellaneous details. Design problems. Appendix. Index.

Note In its first two editions, this established textbook contained an elementary part designed as an introduction to the subject and a more advanced part addressed to advanced students and practicing engineers. When the revision for the third edition was undertaken, it was decided to divide the work in two volumes, one to cover introductory and elementary aspects and the other to cover advanced topics. At the time this review was written (1957) the advanced volume of the third edition has not appeared. Considered by itself the present volume is a well-written introduction to the design of uncomplicated concrete structures and to information on materials, methods of mixing, proportioning, etc. of concrete. It includes short chapters on precast and prestressed concrete A style that is easy to read, an adequate number of worked examples of design problems, and explicit discussions of such common problems as the design of stone-faced retaining walls give it potential usefulness to builders and engineers who are not specialists in reinforced concrete but occasionally design a structure in this material.

Komendant August E

Prestressed concrete structures New York McGraw Hill Book Company Inc. 1952 261 p. illus. 24 cm. $6 00 5668

Civil Engineering

Soil Mechanics

Contents. Introduction, by G. W. McAlpin and L. E. Gregg. [illegible] Engineering [illegible] by E. B. Eckel. [illegible] by J. D. Dowling. [illegible] by E. A. Abdun-Nur and J. D. Dowling. [illegible] by L. A. [illegible] and A. M. Johnson. [illegible] by T. M. Thornburn. [illegible] Application of aerial photographs [illegible] by R. D. Miles. The preparation of [illegible] soil survey of New Jersey by D. R. Lueder. [illegible] by E. R. LeRoy [illegible] by D. [illegible]. Application of [illegible] by W. J. [illegible] and R. H. [illegible] exploration, by A. M. Johnson and R. H. [illegible] in New York State, by F. H. [illegible] by D. [illegible] by I. [illegible] method. General discussion.

Note. These papers describe and evaluate the geological, geophysical, soil photogrammetric techniques which may be applied to determine the physical characteristics and structure of surface and subsurface soils. The material has been prepared by experts in the [illegible] for the guidance of civil engineers concerned with the location, design, and construction of engineering works. Bibliographies are included.

American Society for Testing Materials

Symposium on the identification and classification of soils. Presented at the fifty third annual meeting, American Society for Testing Materials, Atlantic City N J., June 29 1950. Philadelphia. American Society for Testing Materials, 1951 91 p. illus. 23 cm. (Special technical publication no. 113) $1.65 5681

Contents. Introduction, by G. W. McAlpin. Identification and classification of soils [illegible] by D. M. Burmister. A standard classification of soils as prepared by the Bureau of Reclamation, by E. A. Abdun-Nur. [illegible] of highway subgrade materials [illegible] by the Highway Research Board, by W. F. Abercrombie. Soil classification for highway purposes, by E. A. Willis. [illegible] by E. J. [illegible]. General discussion.

Note. These papers describe the techniques and procedures [illegible] by engineers for identifying and classifying soils. The purpose of the symposium was to [illegible] discussion of differences in procedures and to encourage the acceptance of standard methods. The authors are experts in the field of soil mechanics and have had wide experience [illegible] the particular method described.

Andersen, Paul

Substructure analysis and design. Second edition. New York The Ronald Press Company 1956. 336 p. illus. 24 cm. $7.00. 5682

Contents. Earth pressures. Sheet piling. Soil bearing power. Footings. Piles of steel, timber, and concrete. Pile groups. Cellular cofferdams. [illegible] Open and pneumatic caissons. Floating caissons. Breakwaters. Wharves and piers. Bridge piers and abutments. Appendix. Index.

Note. The varieties of substructures treated in this book are usually treated briefly or omitted altogether from the standard books on structural analysis and foundation design. All of the types of structures treated in the chapter titles are considered from the standpoint of structural analysis and engineering design. The book is primarily [illegible] for use in engineering college courses. However it is written [illegible] that makes it useful to engineers [illegible] not specialists in substructures but occasionally need information about them. The [illegible] includes more worked examples of problems in analysis and design, and scattered footnote references to the literature. The illustrations include [illegible] number of photographs of caissons, breakwaters, cofferdams, etc.

Chellis Robert Dunning

Pile foundations theory—design—practice. New York McGraw Hill Book Company Inc., 1951 680 p. illus. 24 cm. $14.00 5683

Contents (abridged). Basic principles of pile foundations. Pile driving analysis. Hammer speeds, strokes, and driving stresses. Driving equipment. Selection of pile and methods of driving. Pile groups and spacing. Structural design of piles. Wood piles. Concrete and pipe piles. Caisson-type piers and columns. H piles and other metal piles. Sheet piling. Deterioration and preservation of piles. Solidification of soils. Pile load tests. Failures of pile foundations. Tables. Group I—Temporary [illegible]. Group II—[illegible] data on hammers, extractors, and related equipment. Group [illegible] data. Group V—Jetting equipment data. —Pile data. Group VI—[illegible] data. Numerical Appendixes. Numerical examples using [illegible] data. Numerical examples using field data. Summary of comparative results of tests. Applications of methods of determining pile loads under eccentric loadings. Application of method of designing precast concrete piles. Pile [illegible] reports and data. Standard specifications. Bibliography. Index.

Note. A practical book [illegible] contains so much information that it is in effect an engineering handbook. It is useful not only in understanding and designing pile foundations but also in locating them and protecting them after they are built. There are [illegible] range of engineering data and an adequate number of illustrations. The classified bibliography includes [illegible] list of catalogues of piles and piledriving equipment.

Chellis Robert Dunning

Pile-driving handbook theory design, practice of pile foundations. New York Pitman Publishing Corporation 1944 276 p. illus. 21 cm. $6.50. 5684

Contents. The philosophy of pile foundations. Pile-driving analysis and application of formulas. Speed, stroke, and driving stresses. Selection of driving equipment. Selection of type of pile and selection of [illegible]. Effects of pile spacing and grouping. Design methods of driving. Effects of pile spacing and grouping. Deterioration of piles by loadings. Types of concrete piles. Deterioration and preservation of piles. Tables. Appendix. Bibliography. Index.

Note. Covers the theory and design of pile foundations and practical aspects of the subject, giving data needed by civil engineers, construction engineers, pile-driving operators, and architects. Formulas and standard specifications are given in the appendixes, and there is a five-page classified bibliography.

Crum Roy Winchester, and others editors

Soil exploration and mapping presented at the twenty ninth annual meeting, 1949 Highway Research Board, Division of Engineering and Industrial Research, National Research Council. Editorial staff Roy W Crum, Fred Burggraf W N Carey Jr Washington D C. Highway Research Board, 1950. 121 p. illus. 25 cm. (Highway Research Board. Bulletin no. 28) $1.50. 5685

Contents. Introduction, by F. R. Olmstead. A system for designating map-units on engineering soil-maps, by D. R. Lueder. Drainage pattern significance in airphoto identification of soils and bedrocks, by M. Parvis. Maps for construction materials, by F. E. Byrne. Development of geophysical methods of subsurface exploration in the field of highway construction, by R. W. Moore. Influence of topographic position in airphoto identification of permafrost, by R. E. Frost and O. W. Mintzer.

Note. The papers published in this bulletin bear on the status of geological and agricultural soil mapping in the United States of America and also describe methods [illegible] highway engineers may obtain from geological and soil maps and related sources of information such as aerial photographs information that is valuable in making [illegible] surveys in advance of road-building. Certain tables in the introduction supplement information on soil surveys published in the Board's Bulletin no. 22 described below.

Note The fundamentals of the subject are presented as simply as possible, with emphasis upon practical considerations. The book illustrates by actual application in typical problems the modern methods of continuity. Complete designs have been made for several types of structure and complete designs of portions of the structures have been made in several alternative methods.

URQUHART, LEONARD CHURCH, AND OTHERS

Design of concrete structures. Fifth edition By Leonard Church Urquhart, Charles Edward O Rourke and George Winter New York McGraw Hill Book Company, Inc., 1954 514 p illus 24 cm. 5675

Contents Section I, Plain concrete. Section II, General properties of reinforced concrete. Section III, Beams and slabs. Section IV Columns. Section V Bending and axial stress. Section VI, Continuous beams and frames. Section VII Footings. Section VIII, Reinforced concrete buildings. Section IX, Retaining walls. Section X, Arches. Section XI, Slab, beam, and girder bridges. Section XII, Modern developments in concrete design. Appendixes Standard notations. Allowable unit stresses (ACI code) Flat slabs with square or rectangular panels (ACI code) Tables and diagrams. Columns subjected to axial load and bending. Index.

Note. This book is used primarily for the instruction of engineering college students, and it covers the design of reinforced concrete structures, with the exception that some highly specialized types f structures, such as shells. The primary emphasis is on theory but materials and practical design are adequately described in view of the book's purpose. The fourth edition was published in 1940. For this edition the book was very extensively rewritten so as to bring it into accord with changes in the building codes and current design practices. The treatments of some topics, such as the design of rigid frames, have been rewritten. The terminal section or chapter now discusses such modern developments as plastic design, prestressed concrete, and the design of pre-tensioned and post-tensioned beams. The sixth edition was published in 1958, 546 p., $8.00.

VOLLMER, H C

Annotated bibliography on calcium chloride in concrete (chronologically arranged) Washington D C National Academy of Sciences—National Research Council, 1952 57 p 28 cm. (National Research Council. Publication 217 Highway Research Board Bibliography 13) $0 60 5676

Contents Foreword. Bibliography Author index. Subject index.

Note This annotated bibliography records 186 numbered literature references dated between 1885 and 1951 Given are the title of each reference, its author place, date, and medium of publication, and note, in many cases extensive, summarizing the contents and conclusions of the article. In some cases, there is also reference to abstracts. The items listed concern the effects of calcium chloride on the properties of Portland cements as well as on concrete. Material in all languages has been included with titles translated into English. The foreword contains summary of the history of research investigations on the effect of calcium chloride on cements.

WILLIAMS, CLIFFORD D , AND CHARLES E CUTTS

Structural design in reinforced concrete. New York The Ronald Press Company 1954 308 p illus. 24 cm. $6 00 5677

Contents Concrete. Moments and shears for continuous structures. Bending. Bending and direct stress. Retaining walls and footings Miscellaneous structures. Prestressed concrete. Concrete construction. Concrete design for ultimate stress. Appendix. Index.

Not A relatively short, introductory treatment designed for use by civil engineering and architectural students. The authors have paid special attention to clear definitions of terms and to the relating of design problems to the basic theory They has also derived the chief formulas and introduced the standard specifications which the practical designer must use. The expository text includes numerous worked examples. The chapters on prestressing and on design for ultimate stress are bare outlines of these techniques, but their inclusion in an introductory book is worthy of note.

SOIL MECHANICS, FOUNDATIONS, AND ENGINEERING GEOLOGY

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on consolidation testing of soils Presented at the fifty fourth annual meeting, American Society for Testing Materials, Atlantic City, N J., June 18, 1951 Philadelphia American Society for Testing Materials, 1952 109 p illus 23 cm. (Special technical publication no 126) $1 75 5678

Contents. Introduction, by D M. Burmister. Report of consolidation tests with peat, by J B. Thompson and L. A. Palmer. Consolidation and related properties of loessial soils, by W G. Holtz and H. J Gibbs. Settlement of a railroad embankment crossing the Morganza floodway Louisiana, by W G. Shockley and C. I Mansur Aids in the interpretation of the consolidation test, by H. Matlock and R. F Dawson. A rapid technique of consolidation testing. by R. H. Karol. The effect of temperature on the consolidation characteristics of remolded clay by F N Finn. Observed settlements of highway structures due to consolidation of alluvial clay by E. S. Barber The application of controlled test methods in consolidation testing, by D M. Burmister.

Note. These papers describe and evaluate the various tests currently employed to determine the consolidation characteristics and behavior of soils under stress. The material has been prepared by professional civil engineers and is based both on laboratory research and practical experience in the field. As with most of the American Society for Testing Materials symposia, the discussions following each paper constitute vital part of the presentation.

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on load tests of bearing capacity of soils Fiftieth annual meeting American Society for Testing Materials Atlantic City, N J., June 16–20, 1947 Philadelphia American Society for Testing Materials, 1948 148 p illus. 23 cm (Special technical publication no. 79) $3 00 5679

Contents. Introduction to symposium, by W S. Housel. Final report of the symposium committee. Field loading tests for the evaluation of the wheel load capacities of airport pavements, by L. A. Palmer Methods of testing soils for runways and foundations, by E. E. Seelye, W D Bailey and S. D. Teetor Use of load tests in the design of flexible pavements, by W H. Campen and J. R. Smith. Field bearing tests applied to pavement design, by R. E. Phillippe. A cyclic load-test procedure, by J. E. Hittle and W H. Goetz. A Canadian investigation of load testing applied to pavement design, by N W McLeod. General discussion.

Note. Under the impetus of World War II, load-test measurement of the bearing capacities of soils, particularly in relation to airport construction, became an increasingly important engineering practice This pamphlet brings together information on load-testing procedures, methods of analysis, and means of applying test results in the design of pavements. A general bibliography of seventy-six entries is provided in addition to the references cited by individual authors.

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on surface and subsurface reconnaissance. Presented at the fifty fourth annual meeting American Society for Testing Materials Atlantic City N J., June 19 1951 Philadelphia American Society for Testing Materials 1952 228 p. illus. 23 cm. (Special technical publication no 122) $3 00. 5680

[illegible] textbook for engineering college students, this book will be useful to practicing civil engineers as well. Methods of testing soils in the laboratory are described separately and many techniques and examples of apparatus are shown in illustrations. The more standard tests are evaluated from the engineer's standpoint. The author is a member of the faculty of the Massachusetts Institute of Technology.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Frost action in soils a symposium presented at the thirtieth annual meeting January 9–12, 1951. Washington, 1952. 384 p. illus. 25 cm. (National Academy of Sciences. National Research Council. Publication 213 Highway Research Board. Special report no. 2) $3.75. 5692

Contents. Climate and distribution of soil. Major soil profiles and their occurrence with climate, by A. C. Orvedal and others. Climatic aspects of frost heave and related ground frost phenomena, by R. A. [illegible]. Soil temperature and thermal properties of soils. Soil temperature, a review of the literature, by C. B. Crawford. Field measurements of soil temperature in Indiana, by E. J. Yoder and C. R. Lowrie. An absolute method of determining thermal conductivity and diffusivity of soils, by A. D. Misener. The thermal conductivity probe, by F. C. Hooper. Discussion of soil temperature, by E. E. Miller. Soil moisture and moisture movements. Methods for measuring the moisture content of soils under field conditions, by G. J. Bouyoucos. The measurement of soil moisture and temperature by heat-diffusion moisture cell, by W. M. Aldous and K. L. Lawton. The measurement of soil moisture and density by neutron and gamma-ray scattering, by D. J. Belcher [illegible]. Water in highway subgrades and foundations, by F. N. Hveem. Soil moisture under concrete pavement of an airport, by T. B. [illegible]. Distribution of capillary moisture at equilibrium in stratified soil, by M. C. Spangler and W. T. Pien. Moisture conditions under flexible airfield pavements, by J. F. Redus and C. R. Foster. Basic data pertaining to frost action: Heat transfer and temperature distribution in soils for transient heat flow due to cylindrical sources and sinks, by Y. S. Touloukian and others. Thermal properties of soils, by M. S. Kersten. Relation of frost action to the clay mineral composition of soil materials, by R. E. Grim. A theory of ice-blocked drainage as a principal factor in frost heave, slump, and subsidence, by P. A. Siple. Soil instability on slopes in regions of perennially frozen ground, by R. S. Sigafoos and D. M. Hopkins. Calculation of depth of thaw in frozen ground, by H. Carlson. Interpretation of permafrost features from airphotographs, by R. E. Frost. Cold room studies of frost action in soils, by J. F. Haley and C. W. Kaplar. Frost action and spring breakup. The nature and extent of damage to New Hampshire highways from frost action, by P. S. Otis. Frost action and spring breakup in Colorado, by R. E. Livingston. Frost action in Michigan, by O. L. Stokstad. Frost damage to roads in Great Britain, by D. Croney. Load-carrying capacity of roads affected by frost action, by T. R. Lawrence. Pre-action studies of thirty soils in New Jersey, by F. C. Rogers and K. C. [illegible]. Investigation of the effect of frost action on pavement supporting capacity, by K. A. Linell and J. F. Haley. Remedies and treatments. Calcium chloride treatment of frost action, by H. R. Smith. Controlling the effects of frost action in Michigan, by O. L. Stokstad. Remedies and treatments for the frost problem in Nebraska, by O. L. Lund. Remedies and treatments by the Connecticut Highway Department, by F. Keene. The influence of frost on highway foundations, by K. L. Fraser. The Norwegian State Railways' measures against frost heaving, by Sv. Skaven-Haug. Results of questionnaire on remedies and treatments, by E. L. [illegible]. Needed research pertaining to frost action. Results of questionnaire on needed research, by F. Olmstead. Needed research pertaining to frost action and related phenomena, by A. W. Johnson. Discussion on the frost symposium, by M. S. Kersten.

Note. Taken together, the papers in this volume present a fairly comprehensive picture of the contemporary status of knowledge of the subject, the currently useful techniques of measurement, the relation of frost action to highway design and maintenance, and the unsolved questions which await research. The style of the papers is technical, and most of them are slanted toward the interests of engineers concerned with highway design.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Laboratory analysis of soils grain size and liquid limit. Presented at the thirty-third annual meeting January 12–15 1954 Washington D C. National Academy of Sciences—National Research Council 1955 37 p. illus. 25 cm. (National Research Council. Publication 343 Highway Research Board. Bulletin 95) $0.60 5693

Contents. Dispersing agents for particle-size analysis of soils, by A. M. Wintermyer and E. B. Kinter. Deflocculating agents for mechanical analysis of soils, by T. Y. Chu and D. T. Davidson. Appendix: Nomenclature of sodium polyphosphates. Rapid methods for determining liquid limits of soils, by F. R. Olmstead and C. M. Johnston. Discussion, by R. V. LeClerc and W. J. Eden.

Note: These technical papers on soils are here published for the information and interest of engineers responsible for testing soil samples for highway construction and maintenance.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Stabilization of soils. Presented at the thirty-third annual meeting, January 12–15 1954 Washington D C. National Academy of Sciences—National Research Council 1955 52 p. illus. 25 cm. (National Research Council. Publication 346 Highway Research Board. Bulletin 98) $0.75 5694

Contents. Effect of petrographic variations of southwestern Iowa loess on stabilization with portland cement, by R. L. Handy and others. Appendices. Stabilization of bank-run gravel by calcium chloride, by F. O. Slate and A. S. Yalcin. Strength of soil-cement as a function of degree of mixing, by C. V. Baker, Jr. Discussion, by J. H. Reynolds and others.

Note. Soil stabilization refers to the techniques by which an increase in the bearing capacity of soils can be obtained. The technique may be satisfactorily applied in the construction of bases and sub-bases of paved or unpaved roads. In this publication are printed three papers describing laboratory investigations on different aspects of soil stabilization and the conclusions of the authors. The publication is chiefly of interest to highway engineers and technicians concerned with the improvement of materials for road construction.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Soil and soil-aggregate stabilization. A symposium presented at the thirty fourth annual meeting January 11–14 1955 Washington, D C. National Academy of Sciences—National Research Council, 1955 175 p. illus. 25 cm. (National Research Council. Publication 359 Highway Research Board. Bulletin 108) $3.00. 5695

Contents. The science of soil stabilization, by H. F. Winterkorn. Inheritance factor in origin of clay minerals in soil, by F. B. Van Houten. Engineering pedology and soil stabilization, by F. L. D. Wooltorton. Soil stabilization and colloid science, by E. A. Hauser. Prediction of the consistency limits of soils and soil mixtures, by M. [illegible]. Exchange adsorption by clays of large organic cations, by J. E. Gieseking. Discussion, by E. H. [illegible]. Microbiological factors in soil stabilization, by P. C. T. Jones. Stabilization of laterite soils, by A. Remillon. Soil stabilization with lime-fly ash mixtures—preliminary studies with silty and clayey soils, by T. Y. Chu and others. Soil stabilization with resins and chemicals, by R. C. Mainfort. Effect of calcium on the consistency of [illegible], by R. L. Rollins. Elastic behavior of soil-cement mixtures, by F. Reinhold. Factors influencing physical properties of soil-cement mixtures, by E. J. Felt. Stabilization of Tennessee gravel and chert bases, by E. A. Whitehurst. Discussion, by E. H. Miller.

Note. This bulletin contains contributions to a symposium on the science of soil stabilization attended by engineers from the United States, Europe, and Africa. Collectively the papers portray the present state of soil stabilization as an organized field of

CRUM, ROY WINCHESTER, AND OTHERS, editors

The use of agricultural soil maps and the status of agricultural soil mapping in the United States, presented at the twenty-eighth annual meeting, 1948, of the Highway Research Board, Division of Engineering and Industrial Research, National Research Council. Editorial staff R. W Crum, Fred Burggraf, W N Carey, jr Washington, D C Highway Research Board, 1949 128 p illus 25 cm. (Highway Research Board. Bulletin 22) $1 80 5686

Contents Review of the problem and selected bibliography by F R. Olmstead. Status of county agricultural soil mapping in the United States—tabulation by states and counties. Use of agricultural soil maps in making soil surveys, by L. D Hicks. Significance of the soil survey report in the selection and preliminary assessment of sites for airplane landing strips by G. B Bodman.

Note The cover-title of this bulletin is Engineering use of agricultural soil maps. It gives information to enable highway engineers to make use of county soil maps and the soil profile method as sources of engineering data for soil survey work. The tabulation by states and counties shows the 1948 status of agricultural soil mapping in the United States, indicates dates and ratings for the counties having maps, and lists libraries by states where the maps may be consulted.

DUNHAM, CLARENCE WHITING

Foundations of structures. New York McGraw Hill Book Company, Inc., 1950 679 p illus 23 cm. (Civil engineering series, F T Mavis, consulting editor) $9 00 5687

Contents Introduction. Soils as foundation materials. Exploration of site. Some principles of foundation action. Spread footings. Foundation walls. Mats. Foundations subjected to overturning forces. Piles. Pile foundations. Cofferdams and other aids for open excavations. Caissons. Bridge piers. Bridge abutments. Underpinning. Planning the foundation for a large stack. Appendix. Index.

Note An authoritative work on the design of foundations for most of the important types of structures. The author stresses the fact that the civil engineer who designs foundations is confronted with a new set of conditions each time he undertakes a job, and therefore must exercise a high order of creative ability in order to produce a safe, practical, and economical design. Numerous worked design problems are included, and case histories involving the construction—and sometimes the failure—of particular foundations are incorporated also. The book is intended primarily for engineering college students, but it should be useful to many young graduate engineers and also to older graduates who have not specialized in foundations but find themselves forced to design an unusual one.

GEOLOGICAL SOCIETY OF AMERICA

Application of geology to engineering practice. Berkey volume Sidney Paige, chairman New York The Geological Society of America, 1950 327 p illus (part col d) 25 cm $2 75 5688

Contents Introduction, by S. Paige. Charles Peter Berkey by J L. Savage and R. Rhoades. The geologist in the engineering organization, by E. B. Burwell, jr and G. D Roberts. Geology in dam construction, by E. B. Burwell, jr and B. C. Moneymaker Engineering geology in the design and construction of tunnels, by J F Seaborn. Mechanics of landslides, by K. Terzaghi. Faults and engineering geology by G. D Louderback. Geology and engineering in the production and control of ground water by O. E. Meinzer Engineering geology of highway location construction, and materials, by E. F Bean. Geological aspects of beach engineering, by W C. Krumbein. Petrology of concrete affected by cement-aggregate reaction, by D McConnell and others. Geologic engineering in the petroleum industry by K. C. Heald. Geology in the discovery development, and exploitation of mineral deposits, by M. H. Gidel. Military geology by C. B. Hunt.

Note. A volume of original contributions in the field of engineering geology which was written and published in honor of Dr. Charles Peter Berkey Newberry Professor Emeritus of Columbia University former secretary and president of The Geological Society of America. The various papers, each of which has its own table of contents, illustrations, and bibliographical references, stress underlying principles rather than engineering or geologic detail. The work is addressed to those with technical training in engineering or geology or both, and will particularly interest the geologist he may be retained as consultant on large engineering projects.

HOOL, GEORGE ALBERT, AND W S KINNE, editors

Foundations abutments and footings, compiled by a staff of specialists editors-in-chief, George A. Hool and W S Kinne, revised by R. R Zipprodt and E J Kilcawley Second edition. New York McGraw Hill Book Company, Inc., 1943 417 p. illus. 23 cm. $6.50. 5689

Contents Soil investigation. Excavation. Foundations. Spread footings. Underpinnings. Foundations requiring special consideration. Bridge piers and abutments. Application of the law relative to the engineer Appendixes. Characteristics of soils. Formulas for bearing power of piles. Index.

Note A discussion of the engineering of foundations of all types, footings and piers, land and underwater, describing each type of structure, its suitability for various purposes, factors of design, design methods, construction pointers, and other facts to aid the engineer and construction man in their work in this field. In this second edition, there has been complete revision of the text and appendixes, with new methods indicated and new illustrations provided. I the section on spread footings, the design of isolated spread footings has been revised to conform to the 1941 building regulations for reinforced concrete of the American Concrete Institute.

KRYNINE, DIMITRI PAVLOVITCH

Soil mechanics its principles and structural applications. Second edition New York McGraw Hill Book Company Inc., 1947 511 p illus. 23 cm. $7 50 5690

Contents Part I, Elements of soil physics: Origin and general characteristics of soils. Soil moisture—and plasticity and consistency. Seepage phenomena and frost action in soils. Part II, Elements of the mechanics of earth masses. Stresses in earth masses. Shearing resistance and conditions of failure of an earth mass. Compression strains—theory of consolidation. Review of parts and II—and introduction to part III. Part III, Structural applications: Stability of foundations. Stability of cuts and embankments. Stability of retaining walls and cofferdams. Pressure on tunnels and conduits. Highway and runway subgrades. Settlement of structures. Soil sampling and field soil testing. Appendices. Author index. Subject index.

Note. Much of the literature on soil mechanics is too theoretical to be of use to the average engineering student or practicing civil engineer. This work is designed to interpret the theoretical knowledge in practical terms and, also, to describe established practices, some of which are not yet completely buttressed by laboratory data. Since the publication of the first edition in 1941 it has been used both as textbook in organized courses and as a reference handbook by engineers. This edition has been rather extensively revised. The two chapters dealing ith soil pressures on tunnels and culverts, and ith highway and airport runway subgrades are new Throughout the text, there are many smaller revisions.

LAMBE THOMAS WILLIAM

Soil testing for engineers. New York John Wiley & Sons Inc. 1951 165 p illus. 29 cm. $5 50 5691

Contents Introduction. Specific gravity test. Atterberg limits and indices. Grain size analysis. Compaction test Permeability test. Capillary head test. Capillary-permeability test Consolidation test. Direct shear test on cohesionless soil. Triaxial compression test on cohesionless soil. Unconfined compression test. Triaxial compression test on cohesive soil. Direct shear test on cohesive soil. Appendixes. Specific gravity of water Viscosity of water Conversion factors. Specific gravity of water Viscosity of water Proving rings. Drawing of liquid limit device Derivation of equations. Index.

Civil Engineering

Soil Mechanics

TAYLOR, DONALD WOOD
Fundamentals of soil mechanics. New York. John Wiley & Sons, Inc. 1948 700 p. illus. 22 cm. $7.50. 5702

Contents: Introduction. Preliminary considerations. Simple soil test and soil classification tests. Classifications. Subsurface investigations. Permeability. Weights, stresses and heads, seepage forces. Capillarity. Seepage. One-dimensional consolidation. Use of elastic theory for [illegible] stresses in soils. Settlement analysis. Strength theory. Shearing [illegible] testing methods, shearing characteristics of sands. Shearing strength of cohesive soils. Stability of slopes. Lateral pressures. Stability of retaining walls. Soil mechanics considerations relating to dams. Action of shallow foundations, bearing capacity. Action of piles, pile foundations. References. Index.

Note: The same publisher has now made available Terzaghi's Theoretical soil mechanics, 1943; Terzaghi's and Peck's Soil mechanics in engineering practice (see below); and the present title. The new addition to the literature is written by an Associate Professor of Soil Mechanics at the Massachusetts Institute of Technology and is specifically designed for use in courses offered to graduate engineering students. It contains [illegible] less extensive treatment of theory than Terzaghi's book published in 1943 and is not so full on the practical aspects as the work by Terzaghi and Peck. It does, however, offer different treatments of many topics; hence, parts of it should be of interest to engineers.

TERZAGHI, KARL
Theoretical soil mechanics. New York John Wiley & Sons, Inc., 1943 510 p. illus. 23 cm. $7.50. 5703

Contents: Section A. General principles involved in the theory of soil mechanics: Introduction. Stress conditions for failure in soils. Plastic equilibrium in semi-infinite mass with plane surface. Application of general theories to practical problems. Section B, Conditions for shear failure in ideal soils. Arching in ideal soils. Retaining wall problems. Passive earth pressure. Bearing capacity. Stability of slopes. Earth pressure on temporary supports in cuts, tunnels, and shafts. Anchored bulkheads. Section C, Mechanical interaction between solid and water in soils. Effect of seepage on the conditions for equilibrium in ideal sand. Theory of consolidation. Capillary forces. Mechanics of drainage. Section D, Elasticity problems of soil mechanics. Theories involving coefficient of subgrade, soil, or pile reaction. Theory of semi-infinite elastic solids. Theory of elastic layers and elastic wedges on rigid base. Vibration problems. Appendix. Influence values for vertical stresses in semi-infinite elastic solid due to surface loads. References. Author index. Subject index.

Note: Here are presented the theories on which the computation of earth pressure, bearing capacity, stability of slopes, and settlement of foundations are based. The author has limited his discussion to those theories whose practical usefulness has already been demonstrated by field experience. Throughout the volume he emphasizes the decisive influence of the fundamental assumptions of the computations on the final results, and the text leaves no doubt concerning the limits of the validity of each theory.

TERZAGHI, KARL, AND RALPH B PECK
Soil mechanics in engineering practice. New York John Wiley & Sons Inc. 1948. 566 p. illus. 23 cm. $7.50 5704

Contents: Part A, Physical properties of soils: Index of properties of soils. Hydraulic and mechanical properties of soils. Drainage of soils. Part B, Theoretical soil mechanics: Plastic equilibrium in soils. Settlement and contact pressure. Hydraulics of soils. Part C, Problems of design and construction. Soil exploration. Earth pressure and stability of slopes. Foundations. Settlement due to exceptional causes. Appendix. Miscellaneous problems of design and construction. Index.

Note: The senior author's *Theoretical soil mechanics* is well known as [illegible] major contribution to the current knowledge of soil mechanics. It is, however, too theoretical and mathematical for the typical practicing engineer. In this new work, the treatment is less mathematical, and the emphasis has been shifted to the practical analysis and solution of soil problems encountered in building. Nevertheless, approximately half of the book deals with general principles and phenomena; it [illegible] only in Part C that such structures [illegible] retaining walls, embankments, earth dams, footings, and the causes of settling are considered. Highway, airport and tunnel problems are not discussed specifically but much of the material is applicable to them.

TRASK, PARKER DAVIES, editor
Applied sedimentation. Prepared under direction of Committee on Symposium on Sedimentation Division of Geology and Geography National Research Council, Washington D C. New York John Wiley & Sons, Inc., 1950. 707 p. illus. 24 cm. $8.00 5705

Contents (abridged): Part I, Basic principles of sedimentation: Dynamics of sedimentation, by P. D. Trask. Origin of soils, by H. Jenny. Geophysical problems in applied sedimentation, by R. F. Brown. Principles of soil mechanics as [illegible] by [illegible] geologist, by C. A. Kaye. Sedimentation and ground water, by F. C. Foley. Part II, Engineering problems involving strength of sedimentary foundation problems of sedimentary rocks, by S. S. Philbrick. Earth dams, by T. A. Middlebrooks. Geologic aspects of soil ground tunneling, by K. Terzaghi. Sedimentary geology of the alluvial valley of the lower Mississippi River and its influence on foundation problems, by W. J. Turnbull and others. Part III, Applications of processes of sedimentation. Relation of landslides to sedimentary features, by D. J. Varnes. Permafrost, by R. F. Black. Geology in shore-control problems, by M. A. Mason. Stream-channel control, by S. C. Happ. Sedimentation in reservoirs, by A. S. Fry. Problems of irrigation canals, by A. R. Golzé. Effects of soil conservation, by C. B. Brown. Part IV, Applications involving nature of constituents: Influence of sedimentation on concrete aggregate, by E. Rhoades. Application of studies of the composition of clays in the field of ceramics, by R. E. Grim. Foundry sands, by H. Ries. Part V, Economic mineral deposits: The field of economic geology of sedimentary mineral deposits, by V. E. McKelvey. Sedimentary iron deposits, by S. A. Tyler. Geochemical prospecting for ores, by H. E. Hawkes. Part VI, Petroleum geology problems: Subsurface techniques, by D. A. Busch. Porosity, permeability and capillary properties of petroleum reservoirs, by C. D. Russell and P. A. Dickey. Carbonate porosity and permeability, by W. C. Imbt. Part VII, Military applications. Sedimentary materials in military geology, by F. C. Whitmore, Jr. Applications of sedimentation to naval problems, by R. D. Russell. Author index. Subject index.

Note: Mainly [illegible] survey of the aspects of sedimentation, sedimentary rocks, and other sedimentary deposits [illegible] hich are of practical concern to engineers. The typical chapter is essentially an outline of high spots, coupled with [illegible] good list of references for those [illegible] ho wish to read further. An unusual feature is the inclusion in most chapters of [illegible] few paragraphs on research [illegible] hich is still needed.

TREFETHEN JOSEPH MUZZY
Geology for engineers. New York D Van Nostrand Company Inc. 1949 620 p illus. 24 cm. $7.00. 5706

Contents: Geology and engineering. Minerals. Rocks, an introduction. Igneous rocks. Rock weathering and the regolith. The consolidated sediments. Metamorphism and the metamorphic rocks. Geological structures. Geological field work. Geophysical exploration in engineering. Earth history. Geologic maps. The atmosphere. Subsurface water. Earth movements. Earthquakes. Streams. Dam sites and reservoirs. Soil erosion. Shorelines. The work of glaciers. Geologic interpretation of topographic maps and airplane photographs. Appendixes: Sources of geologic information. The physical properties of some common rock types. Tables for the identification of some of the common minerals. Author index. Subject index.

Note: In this college textbook the aim is to give the student broad background which will enable him to understand the geological problems involved in excavation work, foundation design, etc.; hence, the highly developed geological applications of engineering, such as soil mechanics, are touched upon only incidentally. The book is well organized and clearly written. The illustrations are as effective as the text in relating geology to engineering.

TSCHEBOTARIOFF GREGORY P
Soil mechanics, foundations and earth structures an introduction to the theory and practice of design and construction. New York McGraw Hill Book Company Inc., 1951 655 p illus. 24 cm. (Civil engineering series Frederic T Mavis, consulting editor) $7.50. 5707

Contents: Special features of foundation and soil engineering. The formation of soils, geology agricultural soil science, and civil engi-

knowledge important in its engineering applications. The individual papers contain introductions, figures, tables, and references.

PECK, RALPH B, AND OTHERS

Foundation engineering By Ralph B Peck, Walter E Hanson, and Thomas H Thornburn New York John Wiley & Sons, Inc., 1953 410 p illus. 24 cm. $8 00 5696

Contents Part A, Properties of subsurface materials: Identification of soils and rocks. Physical properties of soil and rock. Techniques of subsurface investigation. Character of natural deposits. Program of subsurface exploration. Part II, Types of foundations and methods of construction. Excavating and bracing. Drainage and stabilization. Footing and raft foundations. Pile foundations. Pier foundations. Pier shafts, retaining walls, and abutments. Shoring and underpinning. Part III, Selection of foundation type and basis for design. Factors determining type of foundation. Foundations on sand. Foundations on clay. Foundations on silt and loess. Foundations on nonuniform soils. Damage due to construction operations. Part IV Structural design of foundation elements. Individual column and wall footings. Footings subjected to moment. Combined footings and rafts. Retaining walls and abutments. Problems. Index.

Note An excellent introduction to present-day foundation engineering. It is intended for undergraduate students in engineering colleges, but it will be of value also to such readers as contractors and architects who are occasionally called upon to design a foundation and to civil engineers who graduated from college before the recent advances in theoretical soil mechanics. There is no discussion of theoretical soil mechanics as such, but this science forms the background for the practical descriptions of soil characteristics, properties and classification in the first two chapters. Special emphasis is given to the selection of the best type of foundation for particular site and use, the selection to be based on a sound understanding of the engineering properties of soils and rocks.

PRENTIS, EDMUND ASTLEY, AND LAZARUS WHITE

Underpinning its practice and applications Second edition, revised and enlarged. New York Columbia University Press, 1950 374 p illus 25 cm. $10 00. 5697

Contents Foreword, by W A. Starrett. General considerations. Preliminary support. Underpinning methods. Examples of underpinning. Applications of underpinning methods to other work. Raising and moving structures. An introduction to the science of foundations. The White House. Appendices. Specifications (including payments) Legal aspects of underpinning and foundation work. Rates of pay. Glossary of terms used in underpinning. Index.

Note. This work has been the standard engineering treatise on the support of buildings and other existing structures while adjacent construction is going on since the publication of *Modern underpinning* in 1917 The title was changed to *Underpinning* in the edition published in 1931 The major change in the present edition is the addition of the chapter on the raising and moving of existing structures.

SCHULTZ, JOHN R, AND ARTHUR B CLEAVES

Geology in engineering With a chapter on Soil mechanics by E J Yoder New York John Wiley & Sons, Inc. 1955 592 p illus. 23 cm $8 75 5698

Contents Geology and its relationship to civil engineering. Minerals. Rocks. Geologic structure. Subsurface water. Rock weathering and soils. Erosion and deposition by streams. Desert land forms. Shore lines and beaches. Glaciers and glaciation. Frost action in soils. Landslides and related phenomena. Volcanoes and earthquakes. Historical geology. Geologic maps and sections. Aerial photographic interpretation of soils. Soil mechanics. Subsurface exploration. Dams and reservoirs. Tunnels. Highways and airfields. Concrete aggregates. Author index. Place name index. Subject index.

Note. The chapter titles indicate the wide range of topics covered in this book. However in numerous instances, only the high points of a topic are included, and the reader is expected to turn to the cited literature for more detail, if more is needed. The book's primary value lies in its relation of the principles and phenomena of geology to problems and practices of civil engineering. The actual design of engineering structures is not covered, but geological matters which should be considered in design are discussed. In addition, there is a good deal of both general and specific information about landscape features and geologic processes which is not related directly to engineering but is helpful as background knowledge for engineers in the field. There is no discussion of foundations for structures (except dams) because adequate treatments of them are already available in books for engineering students and engineers.

SEELYE, ELWYN E

Foundations, design and practice. With special acknowledgment to Philip P Page, jr New York John Wiley and Sons, Inc., 1956 494 p. illus. 26 cm $16.00 5699

Contents Introduction. Push-button design of spread footings and pile caps. Detail foundation design. Retaining walls. Bridge piers and abutments. Foundations for pipes, conduits, and culverts. Dams and reservoirs. Evaluation of bearing power of soil. Waterproofing. Construction methods. Foundations for light masonry. Soil mechanics. Embankments and pavements. Field practice. Costs. Specifications. Exercising engineering judgment. Factual data and appendix. Glossary Index.

Note In this substantial work, the whole field of foundations from earthen beddings for sewer pipes to foundations for large dams is covered. Simple retaining walls and foundations for small houses are included. The author, a construction engineer of long standing and a member of a prominent engineering firm in New York City has addressed the book to civil engineers concerned with foundation design, contractors and builders of foundations, building inspectors, architects etc. The necessity for correlating a knowledge of field and site conditions with design procedures is stressed. Many chapters of the book contain a section labeled "Red lights," in other words, dangers to be guarded against in designing specific foundations for specific conditions. The book contains all the expected information and in addition is a treasury of useful but unusual information gleaned from the author's practice and life-long interest in foundations. The volume is well illustrated and adequately indexed.

SOWERS, GEORGE B, AND GEORGE F SOWERS

Introductory soil mechanics and foundations New York The Macmillan Company 1951 284 p. illus. 24 cm. $6 00 5700

Contents The nature of soils. The physical properties of soils. Soils and soil deposits. Seepage drainage, and frost action. Foundations. Deep foundations. Problems in earth pressure. Construction of fills and subgrades. Stability of earth masses. Underground investigation. Index.

Note A short, simplified treatment suitable for engineering college students and graduate engineers who want only a general working knowledge of the subject. Little mathematics is used, and applications are stressed. The chapters are supplemented by good lists of references for those who need further information on specific topics.

SPANGLER, MERLIN GRANT

Soil engineering Scranton International Textbook Company 1951 458 p. illus. 24 cm. $8 00 5701

Contents Introduction. The origin and nature of soil. The soil profile. Soil structure and texture. Soil density. Soil surveying and sampling. Soil water Hygroscopic moisture and the colloidal fraction. Capillary water Gravitational water and seepage. Flow nets and seepage forces. Soil-water consistency. Engineering soil classification. Frost action in soil. Granular soil stabilization. Thickness of flexible pavements. Stress distribution in soil. Consolidation and settlement of structures. Shearing resistance and strength. Stability of slopes. Embankments, levees, earth dams. Pressure on retaining walls. Bearing capacity Piles and pile-driving formulas. Underground conduits. Index.

Note. A comprehensive introduction to soil topics that are of interest in civil engineering. The scope is wider than is usually embraced in soil mechanics, and the style is less technical than is typical of the basic works on soil mechanics. The book is organized as a college text. However some practicing engineers may find it useful as a simple introduction to such topics as permafrost, especially in view of the selected reference lists that accompany the chapters. The author is Research Professor of Civil Engineering at Iowa State College.

The hydraulic dredging and pumping of lake crest deposits, by W. H. [illegible] The [illegible] and their correction, [illegible] Great Lakes [illegible], by L. J Fuch. Shock pressure on [illegible], by C. W Ross. Some dynamic aspects in the design of [illegible] structures on the Great Lakes, by L. A. Mueller, and others. Experimental studies of forces on piles, by J R. Morison and others. Hydraulic model tests for Indiana harbor development, by L. G. Straub and E. Y. Hudson. Maintenance of navigable channel through [illegible] area, by A. T Ippen and D. R. F. Harleman. Tsunamis, by P Danel.

— Proceedings of Fifth Conference on Coastal Engineering, Grenoble France September 1954 Edited by J W Johnson. Richmond, Calif Council on Wave Research The Engineering Foundation 1955 669 p. illus. 26 cm. $7.50. 5712

Contents: Part 1, Theoretical and observed wave characteristics. [illegible] waves in enclosed bodies of water by R. W Burling. The [illegible] instability of waves on surface of the sea, by J R. D. French. [illegible] hydrodynamique d'une houle en profondeur [illegible], by R. Barrois and C. Chartier. The shoaling and breaking of the solitary wave, by A. T. Ippen and G. Kulin. [illegible] Part 2, Field and laboratory instruments and equipment: [illegible] A capacitance wave recorder for small waves, by M. J. Tucker and H. Charnock. [illegible]

Note. There have been five conferences on this important subject. The first was held in 1950, and the second in 1951. The proceedings of both were published by the Council on Wave Research, and the first of these was still available, price $4.50, when this note was written. The second was out of print. The contents of the latest three volumes of the series, all of which are in print, are listed above. Many of the papers as published contain illustrations and most include literature references.

CONFERENCE ON COASTAL ENGINEERING INSTRUMENTS

Proceedings of the First Conference on Coastal Engineering Instruments Berkeley California, October 31–November 2, 1955 Edited by R. L. Wiegel. Richmond, California Council on Wave Research, The Engineering Foundation, 1956 302 p. illus. 26 cm. $5.00 5713

Contents. Optical measurements of sea surface roughness, by C. Cox. Some laboratory-wave instruments, by M. J Wilde. Capacitive wave profile recorder, by J. M. Killen. Parallel wire resistance wave meter, by R. L. Wiegel. The step-resistance wave gage, by J. M. Caldwell. Mark IX shore wave recorder, by F. E. Snodgrass. Thermopile wave meter, by J. D. Isaacs and R. L. Wiegel. The Mark VIII strain gage wave meter, by J D. Isaacs and others. A ship-borne wave recorder, by M. J. Tucker. A selective period wave recorder, by W. G. Van Dorn. Mechanical recording of waves in the Gulf of Mexico, by H. Flinsch. Progress report on the U S Navy's development of wave recording and analyzing equipment, by F. J. Costello and A. G. Alexion. The N.I.O. wave analyser, by M. J. Tucker. Mooring cable force meter for models, by K. E. Beebe. A prototype mooring force meter, by J. T. O'Brien and R. E. Jones. [illegible] force meter by G. A. Schiemann. An ocean wave force meter, by K. E. Beebe and K. R. Morison. Shock pressure meters, by C. W Ross. Hydrodynamic impact measurements, by V. G. Szebehely and E. E. Zarnick. Instrumentation for investigation of seaplane impact loads in waves, by F. M. Edge, Jr. The principal tide and current measuring instruments used by the Coast and Geodetic Survey, by R. W. Knox. Orbital wave velocity meter and recording system, by D. G. Severn. A miniature current meter and free running rotary flowmeter, by R. R. A. Dodge. Carruthers current meter and wire angle gage, by J. N. Carruthers. C. B. I. salinity-temperature meters, by G. Emerson and D. W. Pritchard. The use of free diving equipment as a tool in coastal engineering and scientific studies, by R. F. Dill. A deep water instrument station, by W. M. Ramsey. List of papers on instruments of the Council on Wave Research published in previous publications.

Note. The conference whose *Proceedings* are published in this volume was concerned with instruments used to obtain data necessary to the design of structures along seacoasts, seaplanes and ships. A number of recently developed instruments are described as to their principles, applications and methods of using. Several papers deal with instruments still under development. Numerous illustrations and diagrams of the instruments and their components are included. There are also some photographs of complete instruments. The papers are technical in style and are addressed to such readers as practicing civil engineers, naval architects, and physicists and engineers engaged in research pertaining to coastal engineering, wave measurement, etc.

LINSLEY RAY K. JR. AND JOSEPH B FRANZINI

Elements of hydraulic engineering. New York McGraw Hill Book Company Inc., 1955 582 p. illus. 24 cm. (McGraw Hill civil engineering series Harmer E. Davis, consulting editor) $9.00. 5714

Contents Part [illegible] Introduction. Descriptive hydrology. Quantitative hydrology. Groundwater. Frequency analysis in hydrology. Water law. Part II, Reservoirs. Dams. Spillways, gates, and outlet works. Open channels. Pressure conduits. Hydraulic machinery. Some economic aspects of hydraulic projects. Part III, Irrigation. Water supply and purification. Hydroelectric power. River navigation. Drainage. Sewerage and sewage treatment. Flood control. Multiple-purpose projects. Appendix. Index.

Note A well-organized textbook for advanced undergraduate students of civil engineering. It provides a broad view of the field with emphasis on its fundamental principles and techniques. Only enough [illegible] included of descriptive engineering to illustrate the applications of principles. Selected literature references are given and the book is adequately illustrated. The authors are members of the faculty of Stanford University

UNITED STATES BEACH EROSION BOARD

Shore protection planning and design. Washington D C. Government Printing Of

neering. Definitions and tests related to the properties of the solid soil particles. Definitions and tests related to the density and to the consistency of soils. Capillary phenomena. Permeability of soils. Ground-water movements. Frost action. The consolidation of soils. The shearing strength and the shearing deformation of soils. The stability of vertical cuts and of slopes. The stress distribution in soils. The bearing capacity of soils. Lateral earth pressures. The compaction and the stabilization of soils. Exploration and classification of soils. The selection of suitable type of foundation. Spread foundations. Excavations. Pile and caisson foundations. Sheet piling. Underpinning. Earth-retaining structures. Cofferdams. Tunnels and conduits. Some soil engineering aspects of dam construction. Effects of vibratory and of slow repetitional loading of soils. Machinery foundations. Some soil engineering aspects of highway and airport construction. References. Name index. Subject index.

Note An engineering college textbook in which the theoretical knowledge of soil mechanics gained in the last few decades is applied directly to practical problems in civil engineering. Although the main theme is practical application of the theoretical knowledge, the author makes it clear that the theoretical knowledge is not complete and that many problems in foundation design must still be solved empirically. Much attention is given to the techniques of field and laboratory testing. Many instances of structural failures due to the vagaries of soils are mentioned. The style is exceptionally clear and the book is well illustrated. The bibliography runs to 448 references. The author is Professor of Civil Engineering in Princeton University

WHITE, LAZARUS, AND EDMUND ASTLEY PRENTIS

Cofferdams. Second edition, revised and enlarged. New York Columbia University Press 1950 311 p. illus (part col'd) 24 cm $10 00 5708

Contents Hydrodynamics of cofferdams. Erosion in streams. Lateral earth pressures. Land cofferdams. Practical considerations. Examples of cofferdams. Appendixes Miscellaneous photographs. Wages and prices. Glossary Bibliography Index.

Note Apparently this work is the only full-scale treatment in book form of its subject. It covers both basic theory and practice. It is used chiefly as a survey and reference book by practicing engineers and contractors who are directly concerned with the construction of cofferdams. The chapter on examples contains specific descriptions of 15 cofferdams of various types. The first edition appeared in 1940. A considerable amount of new material has been added in the present edition.

HYDRAULIC ENGINEERING

CREAGER, WILLIAM PITCHER, AND OTHERS

Engineering for dams, by William P Creager Joel D Justin and Julian Hinds New York John Wiley & Sons Inc., 1945 3 v illus 24 cm Vol I $7 25, vol II, $9.25, vol III $8 50 5709

Contents Volume I General design Investigation of dam sites. The choice of type of dam. Preparation and protection of the foundation. Hydraulic model studies. Flood flows. Spillways. Volume II, Concrete dams Forces acting on dams. Requirements for stability of gravity dams. General procedure for the design of gravity dams. The design of solid nonoverflow gravity dams The design of solid spillway gravity dams. Internal stresses and stress concentrations in gravity dams. Arch dams. Buttressed concrete dams. Concrete for concrete dams. Volume III, Earth, rock-fill, steel, and timber dams Soil tests and their utilization. Earth dams—general principles of design. Stability of earth dams. Details of earth dams. Rock-fill dams. Steel dams. Timber dams. Details and accessories. Headwater control.

Note During recent years many large dams have been built, and dam building has become more of an exact science than formerly *Engineering for dams* has been written in an effort to provide engineers and engineering students with an understanding of the modern dam design theory and practical construction methods The treatment is detailed and includes abundant drawings and data tables which among other things show graphical stress analysis techniques, profiles and plans of typical dams, minor parts of dam structures, and hydrographic information. Photographs of dam construction equipment such as earth movers, and of some of the more important dams in the United States of America are given. Bibliographies are appended to some of the chapters, and the index in each volume covers all three volumes. The work is based in part on Creager's *Engineering for masonry dams*, second edition, New York, 1929, and Justin's *Earth dam projects*, New York, 1932.

CONFERENCE ON COASTAL ENGINEERING

Proceedings of Third Conference on Coastal Engineering, Cambridge, Massachusetts, October, 1952 Edited by J W Johnson. Richmond Calif Council on Wave Research, The Engineering Foundation 1953 343 p. illus. 26 cm. $4 50 5710

Contents. Part I, Basic oceanographic information: Waves and breakers in shoaling water by H. W Iversen. The solitary wave, by J W Daily and S. C. Stephan, Jr. Accuracy of hydrographic surveying in and near the surf zone, by T Saville, Jr and J. M. Caldwell. Environmental aspects of the ebb side and flood side of tidal estuaries as factor in harbor locations, by F E. Elliott and others. The salt wedge, by H. G. Farmer and G. W Morgan. Circulation in estuaries, by B. H. Ketchum. Notes on the generation and growth of ocean waves under wind action by G. Neumann. The papers are technical in style and are addressed to such readers as *practicing civil engineers, naval architects, and physicists and engi*neers engaged in research pertaining to coastal engineering, wave measurement, etc.

Linsley Ray K. jr., and Joseph B Franzini

Elements of hydraulic engineering New York McGraw Hill Book Company, Inc., 1955 582 p. illus. 24 cm. (McGraw Hill civil engineering series Harmer E. Davis, consulting editor) $9.00. 5714

Contents: Part I: Introduction. Descriptive hydrology. Quantitative hydrology. Groundwater. Frequency analysis in hydrology. Water law. Part II: Reservoirs. Dams. Spillways, gates, and outlet works. Open channels. Pressure conduits. Hydraulic machinery. Some economic aspects of hydraulic projects. *Part III:* Irrigation. Water supply and purification. Hydroelectric power. River navigation. Drainage. Sewerage and sewage treatment. *Flood control.* Multiple-purpose projects. Appendix. Index.

Note: A well-organized textbook for advanced undergraduate students of civil engineering. *It provides* ... broad view of the field with emphasis on its fundamental principles and techniques. Only enough is included of descriptive engineering to illustrate the applications of principles. Selected literature references are given and the book is adequately illustrated. The authors are members of the faculty of Stanford University.

United States. Beach Erosion Board

Shore protection planning and design. Washington, D C. Government Printing Of

fice, 1954 v p illus. 26 cm. (U S Department of the Army Office of the Chief of Engineers Beach Erosion Board Technical report no 4) $2 25 5715

Contents Part I Functional planning Physical factors. Littoral processes. Planning analysis. Part II, Structural design Physical factors. Structural analysis. Appendices Glossary of terms. List of common symbols. Bibliography Miscellaneous tables and graphs. Miscellaneous derivations. Example beach erosion control study

Note. A report based on the experience of the Beach Erosion Board and its staff which "have been engaged in the study of shore erosion problems since 1930 and since then have pursued an intensive program of research and development with a view to improving shore protection techniques. The report is written from the practical standpoint hence, although a considerable range of basic information is included, the main emphasis is on principles and techniques of value in the design and construction of protective devices for shores which it is desired to protect against erosion. Considerations in design, examples of design procedures and computations, and typical structures are described specifically In addition, there are a useful glossary and an extensive bibliography as well as an example of a complete beach erosion control study

BRIDGES

AMERICAN ASSOCIATION OF STATE HIGHWAY OFFICIALS

Standard specifications for highway bridges, adopted by the American Association of State Highway Officials Sixth edition Washington, D C Published by the Association, 1953 328 p illus. 23 cm $4 00 5716

Contents (abridged): Division I, General provisions. Division II, Construction. Division III, Design. Division IV Materials. Appendices. Index.

Note The specifications published in this series are used primarily as guides for the preparation of specifications by the various states of the United States of America and for reference by bridge engineers. Some states adopt them without change or with slight modifications. New editions of the book are published frequently and the seventh edition was published in 1957 284 p. $5.00.

CLARK, JAMES G

Comparative bridge designs. Cleveland The James F Lincoln Arc Welding Foundation 211 p illus. 23 cm. $2 00 5717

Contents Introduction. Continuous beams and girders. Simple beam spans. Simple trusses. Continuous trusses. Arches.

Note The material in this book has been selected from papers and designs in an award program sponsored by the James F Lincoln Arc Welding Foundation in 1951 Unlike the award program which resulted in the publication of *Welded highway bridge design*, described below there were no limits on span or width but the contestants were required to design an all-welded bridge paralleling in its dimensions and other conditions a highway bridge of riveted construction. The winning designs are not presented as such in the book. Instead, the details are illustrated and discussed under the chapter headings listed above.

CLARK, JAMES G, editor

Welded highway bridge design. Cleveland The James F Lincoln Arc Welding Foundation 1952 240 p illus. 23 cm $2 00 5718

Contents Introduction. Structural types. Floor systems. New sections. Special connections and details. Quantities and costs.

Note. The contents of this volume have been selected from material submitted in an "award program" sponsored by the James F Lincoln Arc Welding Foundation in 1950. The rules and conditions of the contest limited the contestants to bridges meeting the specifications set forth in a set of rules and conditions, hence all of the bridges in the book are for highway bridges of identical length and roadway width. As indicated by the chapter titles listed above, details of the designs submitted are discussed rather than complete designs. However the types of bridges represented are described in the chapter entitled "Structural types. The book contains many ingenious and sound ideas for the details of welded steel bridges.

HAYDEN, ARTHUR GUNDERSON, AND MAURICE BARRON

The rigid frame bridge. Third edition. New York John Wiley & Sons, Inc., 1950 240 p. illus 24 cm $8 00 5719

Contents Principles of the rigid-frame bridge. Indeterminacy Theory of indeterminate analysis. Calculations for symmetrical single-span concrete frame bridge, hinged-end conditions. Calculations for unsymmetrical single-span concrete frame bridge. Calculations for symmetrical single-span steel-girder frame bridge. Theory and design of double-span frame bridge. Theory and design of skewed concrete frame bridges. Practical points of design and construction. General notes on rigid-frame bridges. Research in rigid-frame bridges. Architecture of short-span bridges.

Note. The principal engineering book on a type of bridge which is much used these days to carry roads and streets over parkways and other arterial highways. The book is addressed to engineers who are concerned with the design of such bridges. The important changes made in preparing this edition include a new simplified method for analysis of skewed arch and frame bridges. The illustrations include photographs of several of the rigid-frame bridges constructed over the parkways of Westchester county in the state of New York.

HOOL, GEORGE ALBERT, AND W S KINNE, editors

Movable and long-span steel bridges, compiled by a staff of specialists editors-in-chief, George A. Hool and W S Kinne revised by R. R. Zipprodt and H. E Langley Second edition. New York McGraw Hill Book Company, Inc., 1943 497 p illus 23 cm. $9 00 5720

Contents (abridged): Bascule bridges, designs and types, selection, superstructure design and erection problems. Foundations for bascule spans. Structural design of double-leaf simple-trunnion deck bascule highway bridge. Design of operating machinery. Vertical-lift bridges. Swing bridges. Continuous bridges, design and erection, stresses. Cantilever bridges. Suspension bridges. Steel arch bridges. Analysis of three-hinged arch bridges. Analysis of fixed arches. Analysis of two-hinged arches.

Note. A comprehensive reference work for the practicing engineer and student. Deals with the problems relating to the design and construction of the various types of bridges listed above. In this edition, errors have been corrected, and developments since the first edition (1923) are covered in paragraphs added at the end of each section. These additions account for 17 additional pages of text. The volume contains numerous photographs illustrating the type of bridge under discussion.

MCCULLOUGH, CONDE BALCOM, AND EDWARD S THAYER

Elastic arch bridges New York John Wiley & Sons, Inc. 1931 372 p. illus. 24 cm. $10 00 5721

Contents. Introduction. Résumé of fundamental theory Preliminary arch design. Analysis of fixed arches. Hinged arch bridges. Multi-span arches on elastic piers. Mechanical methods of stress analysis. Arches with rigidly connected superstructure. Freyssinet and other recent European methods for stress control in elastic arch ribs. Appendix. Index.

Note. Written for engineers by engineers. The authors discuss the mathematical theory of elasticity as applied to the design of arch bridges, with special reference to recent developments in the field of arch analysis. The book includes numerous plans and diagrams, as well as photographs of famous bridges, ancient and modern. The appendix gives useful references and problems arising out of special cases of arch construction which are discussed.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Distribution of load stresses in highway bridges. Presented at the thirty first annual meeting, January 1952 Washington, D C. National Academy of Sciences—National Research Council, 1952 85 p. illus. 25 cm. (National Research Council. Publication 253 Highway Research Board. Research report 14-B) $1.50. 5722

Contents: Effect of trucks upon [illegible] few bridge floors in Iowa in 1932 and in 1948, by A. H. Fuller. Test on rolled-beam bridge using H20-S16 loading, by G. M. Foster. Load distribution between girders on San Leandro Creek bridge, by T. Y. Lin and R. Horonjeff. Load distribution on highway bridges having adequate transverse diaphragms, by G. S. Paxson. Distribution of loads to girders. Slab-and-girder bridges—theoretical analyses and their relation to field tests, by C. P. Siess and A. S. Veletsos. Reactions of two-span, skewed, rigid-frame bridges, by G. P. Fisher and W. C. Lyon. Discussion.

Note: A selection of six illustrated technical papers, written by engineers and addressed to engineers who are concerned with the design of highway bridges.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Vibration and stresses in girder bridges. Presented at the thirty fourth annual meeting, January 11–14 1955 Washington D C. National Academy of Sciences—National Research Council, 1956 134 p. illus. 25 cm. (National Academy of Sciences—National Research Council. Publ. 411 Highway Research Board. Bulletin 124) $2.55 5723

Contents: Vibration measurements on simple-span bridges, by J. M. Biggs and H. S. Suer. Dynamic load analyses and design of highway bridges, by C. T. Schilling. Dynamic studies of two continuous plate-girder bridges, by R. C. Edgerton and G. W. Beecroft. Vibration study of three-span continuous I-beam bridge, by J. M. Biggs and J. A. Bernstein. Vibration and deflection of rolled-beam and plate girder bridges, by G. M. Foster and L. T. Oehler. Highway-bridge impact problems, by T. P. Tung and others.

Note: The six papers listed above are contained in this publication. For the most part they are based on measurements and research carried out by engineers. The results of measurements on specific bridges are included in several of the papers, and apparatus setups for the tests are described and illustrated.

STEINMAN DAVID B

A practical treatise on suspension bridges their design, construction and erection. Second edition, revised. New York John Wiley and Sons, Inc., 1929 299 p. illus. 22 cm. $9.25 5724

Contents: Progress in suspension bridges. Types and details of construction. Typical design computations. Erection of suspension bridges. Appendices: Design charts for suspension bridges. The Florianopolis bridge. The Ohio River suspension bridge at Portsmouth. The deflection theory. Chronological table of suspension bridges. Index.

Note: An authoritative work which is still useful although it has not been revised since 1929. It is addressed to advanced students of engineering who are preparing for careers in bridge design and to graduate engineers. The elements of suspension bridges, their design, and techniques of erection are covered explicitly. Case histories of [illegible] number of suspension bridges are included. The author, an eminent bridge engineer, is an internationally known authority on suspension bridges.

TAYLOR, FREDERICK WINSLOW, AND OTHERS

Reinforced-concrete bridges with formulas applicable to structural steel and concrete, by the late Frederick W Taylor Sanford E. Thompson and Edward Smulski New York John Wiley & Sons, Inc., 1939 456 p. illus. 23 cm. $12.00. 5725

Contents: Characteristics and use of reinforced-concrete girder bridges. Clearances—live loads—impact—distribution of live loads by slabs. Formulas for concentrated truck loads. Slab bridges. Deck girder bridges. Through girder bridges. Cantilever bridges. Description of continuous girder and multi-span frame bridges. Design of continuous girders of equal spans. Continuous girders, fixed-point method. Multi-span rigid frames, fixed point method. Special problems in rigid-frame design, fixed-point method. One-span rigid frame bridges. Flat-slab bridges. Miscellaneous general details. Abutments and piers. Index.

Note: The prime object of this book is to furnish complete information for logical design of bridges other than trusses and arches. It offers comprehensive treatment of slab bridges, simple deck and through girder bridges, cantilever and continuous girder bridges, rigid frames, and flat-slab bridges. The treatment includes discussion of the relative economy and usefulness of these types for different conditions and also the procedure to be followed in developing designs best fitted for any specific requirement.

VINCENT G S

Investigation of wind forces on highway bridges. Presented at the thirty-second annual meeting January 13–16 1953 Washington D C. National Academy of Sciences—National Research Council 1953 30 p. illus. 28 cm. (National Research Council. Publication 272 Highway Research Board. Special report 10) $0.60 5726

Contents: Introduction. Specifications. Nomenclature. Program of tests. Models. Tests at David Taylor model basin. Interpretation of coefficients. Presentation of data. Effect of abutments and ground board. Resultant wind forces. Maximum transverse force. Maximum longitudinal force. Maximum overturning effect. Chester Bridge. Downward reaction due to overturning. Appendices.

Note: A technical paper in which is reported in detail the results of tests of wind forces on model highway bridges, especially as to maximum transverse and longitudinal load forces.

ROADS AND RAILROADS

ALLEN CALVIN FRANCIS

Railroad curves and earthwork. Seventh edition, revised. New York McGraw Hill Book Company Inc. 1931 235 p. illus. 17 cm. $7.50 5727

Contents: Reconnaissance. Preliminary survey. Location survey. Simple curves. Compound curves. Reversed curves. Parabolic curves. Turnouts. Connecting tracks and crossings. Spiral easement curve. Setting stakes for earthwork. Methods of computing earthwork. Special problems in earthwork. Earthwork tables. Earthwork diagrams. Haul. Mass diagram. Spring laying of curves. Diagrams.

Note: This work has been standard textbook and engineers' reference book for many years. In this edition, the chapter on turnouts has been extensively revised, and the chapter on string lining of curves is new. A companion work is the author's Field and office tables, especially applicable to railroads, fourth edition, revised, New York, McGraw-Hill Book Company Inc., 1931 390 p. $4.00.

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on mineral aggregates (1948) Fifty first annual meeting, American Society

for Testing Materials, Detroit, Michigan, June 21–25, 1948 Philadelphia American Society for Testing Materials, 1948 233 p illus 23 cm. (Special technical publication no 83) $3 00 5728

Contents. Introduction to symposium, by K. B. Woods. Distribution of mineral aggregates, by K. B. Woods. Petographic and mineralogic characteristics of aggregates, by R. Rhoades and R. C. Mielenz. Physical and chemical tests of mineral aggregates and their significance, by H. S. Sweet. Sampling of mineral aggregates, by C. E. Proudley Production and manufacture of fine and coarse aggregates, by N C. Rockwood. The grading of aggregates for bituminous construction, by J R. Benson. Grading of mineral aggregates for Portland-cement concrete and mortars, by W H. Price. Influence of mineral aggregates on the strength and durability of concrete by C. W Allen. Lightweight aggregates, by R. E. Davis and J W Kelly Mineral aggregates for bituminous construction, by J T Pauls and C. A. Carpenter Mineral aggregates for low cost roads and water-bound macadams, by E. A. Willis and J A. Kelley jr Mineral aggregates for railroad ballast, by A. T Goldbeck. Mineral aggregates in the chemical and processing industries and in certain other uses, by H. F Kriege. Needed research, by D O Woolf.

Note. A collection of technical papers addressed to engineers, purchasing agents, and persons concerned with the establishment of standards and specifications for industrial materials. Most of them are devoted to aggregates for use in road construction, and most are accompanied by lists of references and reports of the discussion at the meeting.

AMERICAN SOCIETY FOR TESTING MATERIALS

Triaxial testing of soils and bituminous mixtures A compilation of papers presented at the first Pacific Area national meeting San Francisco, Calif , October 10 1949 and fifty third annual meeting, Atlantic City, N J , June 28, 1950, of the American Society for Testing Materials. Philadelphia American Society for Testing Materials 1951 303 p illus. 23 cm. (American Society for Testing Materials. Special technical publication no 106) $3 50 5729

Content Introduction, by W G. Holtz. The history and theory of triaxial testing, and the preparation f realistic test specimens report of the Triaxial Institute, by V A. Endersby Some concepts concerning triaxial compression testing of asphaltic paving mixtures and subgrade materials, by F N Hveem and H. E. Davis. Application of the triaxial test to bituminous mixtures California Research Corporation method, by V R. Smith. Application of triaxial testing to the design of bituminous pavements, by N W McLeod. Triaxial design correlated with flexible pavement performance in Kansas, by H. E. Worley Triaxial testing adapted to soils, flexible bases, and foundations, by R. J Hank. A triaxial apparatus for testing large soil specimens, by E. B. Hall. Shear testing at the Waterways Experiment Station, by S. J Johnson. A triaxial shear investigation on partially saturated soil, by D W Taylor Shear characteristics of remolded earth materials, by A. A. Wagner Application of triaxial compression test results to highway soil problems, by E. S. Barber and C. L. Sawyer The importance of natural controlling conditions upon triaxial compression test conditions, by D M. Burmister Interpretation of triaxial compression tests on granular mixtures, by W S. Housel. General discussion.

Note The method of testing which forms the central theme of this book is defined in Endersby's paper as follows. "the word triaxial" is applied to form of mechanical test under which load is applied axially to cylindrical specimen, while supporting pressure is maintained against its sides by water air or other means. The stress-resistant properties of the material tested triaxially are derived from the relation between the testing load and the supporting pressure. Taken together the papers present the current status of this method of testing as applied to road materials in the United States of America.

BATEMAN JOHN HENRY

Introduction to highway engineering a textbook for students of civil engineering Fifth edition. New York John Wiley & Sons, Inc., 1948 538 p illus. 24 cm. $7 75 5730

Contents. Development of highways. Highway subgrade soils. Drainage. General features of highway design. Grading operations and construction of subgrades. Bituminous materials. Theory of structural design of flexible pavements. Earth, gravel, traffic-bound macadam, and stabilized soil base courses and surface courses. Broken-stone base and surface courses. Bituminous surface treatments and low-cost bituminous surfaces. Theory of structural design of concrete pavements. Concrete pavements and base courses. Sheet asphalt and asphaltic concrete pavements. Rock asphalt pavements. Block pavements. Highway and street maintenance. Surveys, plans, specifications, and supervision of construction. Economics of highway improvement. Highway planning, financing, and administration. Appendices. Determination of street intersection elevations. Tables for determining volumes of earthwork. Problems. Index.

Note: A standard textbook for college students of civil engineering. It is outstanding for its thorough coverage of modern road-building materials and techniques. In the present edition, the work has been extensively revised, and such chapters as those on highway subgrade soils, bituminous construction, grading operations, concrete, soil-cement and bituminous soil bases has been expanded to include recent developments. Many of the bibliographies collected at the ends of the chapters are brought up to date, and the collection of review problems has been revised and enlarged. There ar now over 170 figures, many of which are reproduced from photographs of actual steps in the building of roads.

BRUCE, ARTHUR GARFIELD, AND JOHN CLARKESON

Highway design and construction. Third edition. Scranton International Textbook Company, 1950 734 p. illus. 23 cm. (International textbooks in civil engineering Benjamin A. Whisler, consulting editor) $8.50. 5731

Contents (abridged) Highway administration. Highway location. Design of roads. Design of intersections. Low-cost roads. Bituminous surface treatments. Bituminous-macadam pavements. Portland-cement concrete pavements. Brick and block pavements. General highway and street maintenance. Estimates, contracts, and specifications. Control and testing of construction materials. Transportation surveys. Airport design. Appendixes: Bureau of Public Roads soil groups. Highway Research Board soil classifications. Classification of soils for airport construction—Civil Aeronautics Administration. Index.

Note. A standard engineering college textbook which has been thoroughly revised and modernized in this edition—the first in which Clarkeson appears as co-author. It is introductory but comprehensive enough to be of reference also in libraries. The presentation is only semitechnical hence, the greater part of the book can be readily understood by lay readers seeking information on highway engineering. Each chapter ends with a list of pertinent advanced literature. It should be noted that maintenance operations such as periodic oiling of dirt roads are covered, as are strictly engineering operations.

CRUM, ROY WINCHESTER, AND OTHERS, editors

Symposium investigations of the design and control of asphalt paving mixtures and their role in the structural design of flexible pavements by Corps of Engineers Department of the Army Presented at the twenty eighth annual meeting 1948, of the Highway Research Board Division of Engineering and Industrial Research National Research Council Editorial staff R W Crum Fred Burggraf W N Carey jr Washington, D C. Highway Research Board 1949 115 p. illus. 25 cm (Highway Research Board. Research report no. 7 B) $1.80 5732

Civil Engineering

Roads and Railroads

Contents: Introduction, by G. McFadden and W. C. [illegible]. Laboratory study of [illegible] of test equipment, by J. M. Griffith. Laboratory [illegible] asphalt paving mixtures, by W. K. Boyd. Asphalt stability test [illegible], by C. L. [illegible]. Correlation of laboratory and field data, by [illegible]. Detailed test procedures for design and field control [illegible]. The practical application of asphalt paving mixtures, by J. M. Griffith. The practical application of the design method of asphaltic mixtures to pavement construction, by W. K. Boyd. Design of asphalt mixes as related to [illegible], by W. J. Turnbull. [illegible] flexible pavement design, by [illegible] Smith. [illegible]. Glossary of terms. Discussion, by [illegible]. Discussion, by J. T. [illegible]. Discussion, by [illegible]. Discussion, by W. H. Campen.

Note: The papers here published present the results of an extensive study of asphalt paving mixtures by the Corps of Engineers, U. S. Army, and comments thereon by highway engineers and other [illegible]. Most of the experimental work, including laboratory study, field investigations, traffic tests, and the establishment of pavement criteria, was carried on by the Corps of Engineers Flexible Pavement Laboratory located at the U. S. Waterways Experiment Station, Vicksburg, Mississippi. While the reported projects were directed toward the design of airfield pavements, the results obtained are also applicable to the design of road and street pavements, particularly those subjected to considerable traffic of heavy vehicles.

HAY, WILLIAM W.

Railroad engineering. Volume one. New York, John Wiley & Sons, Inc., 1953. 483 p. illus. 24 cm. $8.50. 5733

Contents (abridged): Part I, Principles of location and operation: Importance of the railroad industry. The nature of railroad traffic. [illegible]. Cost of traffic—operating expenses. The location process—effects of [illegible]. Train resistance. Tractive effort—the steam [illegible]. Acceleration and deceleration. Problems in gradients. [illegible]. Part II, Principles of maintenance and construction: Roadway design. Rail [illegible]. [illegible] construction and maintenance. [illegible] Subgrades and sidings. Drainage. Ballast. Ties. [illegible]. Track fastenings. Track. Organization and work programs. Index.

Note: Although such factors as the changed economic situation and the primary importance of freight as a source of railroad income have brought about major changes in railroad engineering [illegible] the past few decades, most of the text and treatises in the field are more than 20 years old. The publication of this book [illegible]. Most of the matter in it was [illegible] when the other books were written. The [illegible] aspects of route location, curves, etc., are discussed [illegible]. The engineering and maintenance practices described are those which are currently in use on efficient roads. The author [illegible] Associate Professor of Railway Civil Engineering at the University of Illinois, and the work was developed in the course of his teaching.

HEWES, LAURENCE I.

American highway practice. New York, John Wiley & Sons, Inc., 1941–42. 2 v. illus. 23 cm. $10.50 per vol. 5734

Contents: Volume [illegible]: Highway location. Design of roadway. Grading the roadbed. Highway landscape. Sand-clay and stabilized roads. Macadam roads. Gravel and fine-crushed rock roads. Intermediate bituminous surfacings. Appendices. Index. Volume II: Penetration macadam. Sheet asphalt. Asphaltic or bituminous concrete. Construction of Portland-cement concrete roads. Design of cement concrete pavement mixtures. Design of concrete road slabs. Brick roads. Miscellaneous structures. Appendices. Index.

Note: These books provide detailed discussion of both theory and practice of highway location, design, and construction. Enough historical background is given to show the development of each type of road surface and pavement. The results of all important research and experimentation for 25 years are incorporated [illegible] the discussion. Both volumes are liberally illustrated with photographs, charts, and line drawings. Tables of condensed information supplement the text.

HEWES, LAURENCE I. AND CLARKSON H. OGLESBY

Highway engineering. New York, John Wiley & Sons, Inc., 1954. 658 p. illus. 24 cm. $8.00. 5735

Contents: Introduction. Highway systems, organization, and [illegible]. Highway economy. Highway finance. [illegible]. Highway planning. Highway surveys and plans. Rights of way. Highway design. Highway drainage. Roadside development. Traffic engineering. [illegible]. Subgrade structure. Constructing the roadway. Gravel and crushed rock roads—stabilized roads. Base courses. Macadam surfaces—macadam bases. Bituminous pavements. Portland-cement-concrete pavements. Highway maintenance. Index.

Note: Highway design, traffic engineering and highway construction are all co-ordinated in this excellent text. The main theme is good design in the light of what is known about driver psychology, highway and street capacities, sight distances, etc. Systems for continuing traffic are described. Also included is much information on the incidental aspects of highway design, such as the [illegible] costs of collecting tolls, and the costs of stopping and starting automobiles at intersections. In contrast to older texts, there is reduced emphasis on actual construction techniques, although all the methods of current interest are described in fair detail. The book is written in a style which is reasonably easy to read; therefore, it can be recommended to writers and other nonengineers who require technical and semitechnical information about modern highways and traffic problems. Literature references are included and the index is [illegible].

JOHNSON, A. W.

Frost action in roads and airfields: a review of the literature. Washington, D. C., National Academy of Sciences—National Research Council, 1952. 287 p. illus. 28 cm. (National Research Council. Publication 211. Highway Research Board. Special report no. 1) $3.00. 5736

Contents: Foreword. Historical introduction. Definition of frost action. The physical processes of soil freezing and thawing. Magnitude of frost heave and increase in soil moisture. [illegible] of ice and frozen soils. Magnitude of reduction in load bearing capacity. Factors influencing magnitude, rate, and nature of frost action and reduction in load carrying capacity. Penetration of frost. Design methods for preventing detrimental frost action. Construction practices relative to frost action. Permafrost. Heat [illegible]. Thermal properties of materials. Bibliography. Index.

Note: A technical summary of scientific information on frost action taken from the literature of the subject in all languages, including Swedish and Russian, from 1765 to 1951 inclusive. It contains 242 figures (graphs, charts, diagrams, line drawings, photographs) and 70 tables. The bibliography extends to 29 pages.

JUMIKIS, ALFREDS R.

The frost penetration problem in highway engineering. New Brunswick, Rutgers University Press, 1955. 162 p. illus. 26 cm. $5.00. 5737

Contents: Part one: Introduction. The highway and its design. The frost problem. Theoretical bases. Part two: The steady-state flow of heat. Heat conduction in the unsteady-state. Sudden change of temperature. F. Neumann's theory. Sudan's solution. Frost penetration considering upward flow of soil [illegible]. Neumann's theory. The suction force theory. Part three: Some remedial measures against frost damage to roads. Factors to be studied in frost action research. Frost criteria. Summary. Appendices. References and bibliographical notes. Index.

Note: In this useful book various theories applicable to the study of frost penetration in the soils under highways, airport paving, cold storage warehouses, etc., are explained and evaluated. The theories considered are: (1) the steady-state flow of heat; (2) the unsteady-state flow of heat; (3) Neumann's theory; ( ) Sudan's theory; and (5) the suction force theory. The author shows that the last-mentioned theory offers the best approach to the analysis of frost penetration because it takes into account such factors as the geotechnical and thermal properties of soils, and the position of the ground water table. Although primarily [illegible] of theory the book is addressed to practicing engineers and the mathematics has been made as simple as is possible. The chapter on remedial measures against frost damage to roads is [illegible] short but useful summary. Fifty-eight references to the international literature are included in the list of references.

KURTZ, CHARLES MEARS

Track and turnout engineering, a hand book on design details of railroad turnouts and crossings, with mathematical treatments of track layouts and connections. New York Simmons-Boardman Publishing Corporation, 1945 461 p illus. 19 cm. $5 50 5738

Contents: Accepted definitions of general track terms. Design of split switches. Design of frogs. Design of movable point crossings and slip switches. Design of crossings. Design of split switch turnout layouts. Turnouts in paved streets. Turnout engineering. Turnouts connecting with divergent tracks. Connecting tracks. Wye tracks. Siding connections. Crossovers. Yard layouts. Crossing layouts. Solution by traverse. Vertical curves. Easement curves and superelevation. Tables. Index.

Note. An advanced treatment of the subject of track design and layout for engineers connected with maintenance of way or track construction departments of railroads. Numerous illustrative diagrams, worked examples, and tables for making the necessary mathematical calculations are included. Corrections and minor revisions have been made in this edition, and an index has been added.

LABATUT, JEAN, AND WHEATON J LANE, editors

Highways in our national life, a symposium. Princeton Princeton University Press, 1950 506 p illus. 25 cm. $7.50 5739

Contents: (abridged): Part I, Historical: The highway and the anthropologist, by J O. Brew The highway system in the Near East from 3000 B.C., to 300 B.C., by K. Heichelheim. The Roman Empire highway system, by M. P Charlesworth. The early highway in America, to the coming of the railroad, by W J Lane. History of the modern highway in the United States, by S. Miller jr Part II, Analytical The highway and social problems, by F E. Merrill. The fusion of urban and rural, by W Firey and others. The Pan American highway by J L. Harrison. The highway from the point of view of the economist, by S. Peterson. The motor vehicle and the highway some historical implications, by O. Rooney The relation of the highway to rail transportation, by J H. Parmelee and E. R. Feldman. Freight transportation on the highway by W A. Bresnahan. Mass transit on the highway by L. Williams. The planning of the highway by G. D Kennedy The design of highway intersections, by R. H. Baldock. The highway as a park way by H. J Neale. Highway engineering, by L. I. Hewes. Highway construction, by H. C. Coons. Maintenance of the highway by S. O. Linzell and H. D Metcalf. Visibility and highway lighting, by S. G. Hibben. Automotive safety on the highway by N Damon. The service of the highway by O. L. Kipp. Summation, by J Labatut. Selected references. Biographical sketches of contributors. Index.

Note. In this book, prepared under the sponsorship of the Bureau of Urban Research of Princeton University the highway is viewed as an important element in the social structure. Altogether there are 44 chapters, and the majority of them deal with historical or sociological aspects. On the other hand, there are valuable chapters on technical aspects. Those chapters that bear on highway engineering are limited more or less to practices in the United States of America, but the historical and sociological articles are of international interest. There is an extensive but not comprehensive list of references arranged by chapters.

MATSON, THEODORE M, AND OTHERS

Traffic engineering By Theodore M Matson, Wilbur S Smith and Frederick W Hurd. New York McGraw Hill Book Company Inc. 1955 647 p illus 24 cm. (McGraw Hill series in civil engineering Harmer E Davis consulting editor) $12 50 5740

Contents: Introduction. Section I, Characteristics. The road user The vehicle. Speed. Volume. Origin and destination. Stream characteristics. Parking characteristics. Accident characteristics. Section II, Regulations: Basic considerations in traffic regulation. Driver controls. Vehicle controls. General controls. Speed controls. One-way streets. Curb-parking regulations. Miscellaneous regulations. Section III, Control devices and aids. Traffic control devices. Traffic signs and markings. Traffic signals. Road lighting. Section IV Design: Factors in traffic design. Road surface. Cross section. Sight distances. Vertical alignment. Horizontal alignment. The design of maneuver areas. Geometric elements of intersection design. Intersection design. The traffic design of parking terminals. Section V, Administration and planning: Traffic engineering functions and organizations. Traffic factors in administrative decisions. Traffic and planning. Off-street parking. Traffic engineering interests in highway finance. Index.

Note An important treatise developed out of the work of the Bureau of Highway Traffic of Yale University Although it deals with the whole problem, including the characteristics of automobile traffic, police regulations, and other non-engineering aspects, it includes valuable discussions of the traffic factors in highway design. Also included are details of such highway elements as dividers. The entire book is of interest to civil engineers who specialize in highway design.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Bituminous paving mixtures fundamentals for design Washington, D C. National Academy of Sciences—National Research Council, 1955 45 p illus. 25 cm. (National Research Council Publication 355 Highway Research Board. Bulletin 105) $0 75 5741

Contents: Properties required of bituminous paving mixtures. Uses of bituminous paving mixtures. Types of bituminous paving mixtures. Voids. Methods of mixture design. Effects of variations in characteristics and gradations of aggregates on physical properties of mixtures. Effects of variations in bitumen content and characteristics of bitumen on physical properties of mixtures. Practice in designing bituminous paving mixtures. References. Appendixes: Proposed tentative method of test for stability and flow value of bituminous mixtures. Proposed tentative methods of test for resistance to deformation and cohesion of bituminous mixtures. Resistance to deformation. Cohesion. Kneading compaction method for bituminous mixtures to be tested in the H eem Stabilometer. Method of test for determination of bulk-impregnated specific gravity of aggregate for use in bituminous paving mixtures. Method of test for measurement of maximum theoretical specific gravity of a bituminous mixture by solvent immersion. Method of test for maximum specific gravity of bituminous paving mixtures by vacuum-saturation technique using uncompacted samples. Special instructions for mixtures containing porous aggregate not completely coated. Determination of specific gravity of bituminous concrete mix for field density control. Skid resistance of bituminous pavement.

Note: In this bulletin are discussed the fundamentals governing the design of bituminous paving materials. The publication is especially intended for practicing engineers needing concise, up-to-date material on the design and construction of bituminous paving materials.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

Experimental concrete pavements. Presented at the thirty fourth annual meeting, January 11–14 1955 Washington, D C. National Academy of Sciences—National Research Council, 1956 71 p illus. 25 cm. (National Research Council. Publication 403 Highway Research Board Bulletin 116) $1.35 5742

Contents: Report on pavement research project in Indiana, by W T Spencer and others. Report on pavement research project in Ohio, by C. W Allen and L. D. Childs. Appendix.

Note: The pumping action of concrete pavement slabs is a phenomenon which under certain conditions of heavy traffic leads to the breakdown of the pavement. Two four-mile test roads, one in Indiana, one in Ohio, were constructed for the research study of this pumping action. The object was to study the effectiveness of sub-bases in the control of pumping. This bulletin, which is of chief interest to highway engineers, contains illustrated reports describing the location, design, materials, construction, traffic, and early performance of these experimental pavements.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD

The WASHO road test. Final report in two parts. Washington D C. National Academy of Sciences—National Research Council, 1954–55 illus. 28 cm. (National Academy of Sciences—National Research Council. Publication 310, 360. Highway Research Board Special report 18 22) Part I $2.25 part II $3.60. 5743

Contents: Part I, Design, construction, and testing procedures: Background and general description. Construction and construction control. Test vehicles and operations. Instrumentation, procedures, and general research. Appendices: Analysis of construction contract. Summary of construction costs. Control and inspection of subgrade construction. Control and inspection of gravel plant and [illegible] and base construction. Construction and control of bituminous surfacing and studies of the asphaltic concrete. Subgrade moisture content studies, 1952. Identification and stability tests on typical subgrade soil. Transverse position of test vehicles. Part II, Test data, analyses, and findings: Introduction. Primary objectives, principal test considerations, and synopsis of findings. Operation of test traffic. Performance of test pavements. Special observations and measurements. Special studies of pavement material. Maintenance of test pavement. Summary discussion. Appendices: Statistical methods of analysis. List of available supplemental information. Glossary of terms, symbols and conventions, and identification of test sections.

Note: The WASHO road test was a study of the behavior of certain flexible pavements under the repeated application of a number of selected heavy axle loads. It was carried out in 1952 and 1953 on specially constructed pavement sections on a site in southern Idaho. The test was under the sponsorship of the Western Association of State Highway Officials and under the administration and direction of the Highway Research Board. The report includes a comprehensive description of the project, the methods of test operation, and instrumentation procedures. Part I is a report on the construction of the test road and provides the basis for thorough understanding of the test. Part II gives the details of the behavior of the pavement under the controlled heavy truck traffic. Both parts contain technical data presented in text, figures, graphs, tables, and photographic illustrations.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD COMMITTEE ON FLEXIBLE PAVEMENT DESIGN

Design of flexible pavements. Presented at the thirty-third annual meeting January 12–15 1954 Washington, D C National Academy of Sciences—National Research Council 1954 77 p. illus. 25 cm. (National Research Council. Publication 321 Highway Research Board, Research Report 16-B) $1 05 5744

Contents: Foreword, by W. S. Housel. Triaxial tests in analysis of flexible pavements, by C. McDowell. Appendix: Triaxial compression test, Texas Highway Department, THD-1. Discussion, by R. C. Herner. Flexible-pavement design as evolved for heavy traffic, by L. D. Hicks. Flexible-pavement design by the group-index method, by W. C. Davis and W. G. Jones. Modified C. B. R. flexible-pavement design, by D. J. Olinger. Designing flexible pavements (Virginia), by D. D. Wandrey?. Flexible-pavement design correlated with road performance, by D. L. Lacey?. General discussion, by W. S. Housel and others.

Note: The Committee on Flexible Pavement Design by acting as clearing house for the various state highway departments keeps in touch with methods of flexible-pavement design currently used throughout the United States of America. In 1954, a conference was held at which highway engineers of the states—Texas, North Carolina, Missouri, Wyoming, Virginia, Kansas—reported the results of recent experience with methods adopted as a result of their association with the work of the committee. In this report the proceedings of the conference are published with illustrations and bibliographical references for the information of highway engineers concerned with flexible-pavement design.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD COMMITTEE ON FLEXIBLE PAVEMENT DESIGN

Design and testing of flexible pavement. Presented at the thirty fourth annual meeting, January 11–14, 1955 Washington, D C. National Academy of Sciences—National Research Council 1955 87 p illus. 25 cm (National Academy of Sciences—National Research Council Publication 401 Highway Research Board. Bulletin 114) $1.65 5745

Contents. Wheel-load-stress computations related to flexible pavement design, by C. McDowell. Discussion, by R. G. Ahlvin and R. M. Fergus. Design, construction and evaluation of heavy-duty runways, by W. H. Campen and J. R. Smith. Discussion, by R. C. Herner and others. Flexible-pavement design: the cone device, by W. A. Wise. Appendix: method of determining bearing power of soil: the cone device. Discussion, by C. W. Johnston and E. B. Hall. Pavement deflections and fatigue failures, by F. N. Hveem. Discussion, by E. C. Sutherland and others.

Note. In this bulletin are published four technical papers on different phases of the design and testing of flexible concrete pavement for highways and airports. Each paper includes tables and illustrations and is followed by formal discussion presented by engineers in attendance at the Conference where the papers were first presented.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD COMMITTEE ON MATERIAL SURVEYS

Highway materials surveys. Presented at the thirty first annual meeting, January 1952 Washington, D C. National Academy of Sciences—National Research Council, 1952 113 p. illus. (part col d) 25 cm. (National Research Council Publication 247 Highway Research Board. Bulletin 62) $1 50 5746

Contents Foreword, by E. A. Finney. How to use airphotos and maps for material surveys, by O. W. Mintzer and R. E. Frost. Geologic considerations in relation to a materials survey by J. L. Young, Jr., and L. K. Gregg?. Geophysical methods of subsurface exploration applied to material surveys, by R. W. Moore. Material inventories, by T. E. Shelburne.

Note: The problem of obtaining suitable aggregates and granular materials for highway-construction purposes having become critical in some regions of the United States of America, the Highway Research Board in 1947 established the Committee on Material Surveys to study the problem. The scope of work of the committee was to include all aggregate materials emanating from natural gravel deposits or rock formations. The first task of the committee was to bring the art of material surveys up to date by adding geophysical exploration and aerial photography to the older methods. This publication gives recent information and developments on material surveys in such a manner as to be readily usable by those connected with state highway departments in immediate need of such information. The symposium where the contributions were first presented covered only the newer methods, as current practice involving hand test holes and mechanical boring methods were so well known to highway engineers that it was believed unnecessary to repeat them. Each of the four papers is accompanied by a list of references. The first paper, which makes up about half the bulletin, also includes a bibliography of 18 pages on the use of aerial photographs in soil surveys.

NATIONAL RESEARCH COUNCIL. HIGHWAY RESEARCH BOARD COMMITTEE ON NIGHT VISIBILITY

Night visibility 1955 Presented at the thirty fourth annual meeting January 11–14 1955 Washington, D C. National Academy

of Sciences—National Research Council, 1956 65 p illus. 25 cm (National Research Council Publication 415 Highway Research Board Bulletin 127) $1.20 5747

Contents Sign brightness and legibility by T M. Allen and A. L. Straub. Candle power of rear lights on trucks, by K. R. Ricker. Specifications and performance of new sealed-beam headlamp, by W F Sherman. Discussion, by O. W Richards. Co-operative road tests of night visibility through heat-absorbing glass, by H. C. Doane and G M. Rassweiler Discussion, by O. W Richards. Discussion, by O. W Richards. Safety hazard of tinted automobile windshields at night, by H. Haber Visual efficiency in monocular driving, by T Shipley Stray light in the eye, by R. M. Boynton.

Note A collection of technical papers reporting experiments and studies, pertaining to visibility in automobile driving at night. Five of the papers are concerned with the efficiency and effects of such devices as sealed-beam headlamps and tinted windshields. The other two deal with the seeing ability of the human eye under specific conditions, including that of excessive light from the headlamps of meeting automobiles.

NATIONAL RESEARCH COUNCIL HIGHWAY RESEARCH BOARD COMMITTEE ON RIGID PAVEMENT DESIGN

Joint spacing in concrete pavements 10-year reports on six experimental projects. Washington, D C National Academy of Sciences—National Research Council, 1956 159 p illus 25 cm (National Research Council Publication 417 Highway Research Board Research report 17 B) $2 70 5748

Content Analysis of data from state reports, by E. C. Sutherland. Report on experimental project in—California, by F N Hveem. Kentucky by D H. Sawyer Michigan, by H. C. Coons. Minnesota, by E. C. Carsberg and P G. Velz. Missouri, by F V Reagel. Oregon, by G S. Paxson.

Note. In 1940 and 1941 experimental concrete pavements several miles in length were constructed on a comparative research basis in six states—California, Kentucky Michigan, Minnesota, Missouri, Oregon—to allow data to be collected on joint spacing in concrete pavements. These pavements embodied experimental features and were kept continuously under observation for period of 10 years. This publication contains detailed engineering reports after the first 10 years by highway engineers from the six states, introduced by a comparative engineering study of the data by an engineer of the United States Bureau of Public Roads. The publication is of interest to engineers concerned with the performance of concrete pavements under traffic, especially with the performance of expansion joints and contraction joints in concrete pavements under traffic.

NATIONAL RESEARCH COUNCIL HIGHWAY RESEARCH BOARD COMMITTEE ON SURFACE DRAINAGE OF HIGHWAYS

Culvert hydraulics. Presented at the thirty second annual meeting January 13–16 1953 Washington D C National Academy of Sciences—National Research Council, 1953 71 p illus. 25 cm (National Research Council Publication 287 Highway Research Board Research report 15-B) $1 05 5749

Contents Model studies of tapered inlets for box culverts, by R. H. Shoemaker Jr., and L. A. Clayton. Appendix Identification of experiments. Discussion, by W O Ree and C. F Izzard. Importance of inlet design on culvert capacity by L. G. Straub and others. Discussion, by F T Mavis and others. Closure, by L. G. Straub and others.

Note. Published here are two significant contributions to knowledge of culvert hydraulics. the first, a report on tests made on a 4-inch, round, lucite culvert model for the Minnesota State Highway Department and the Bureau of Public Roads the second, report on tests made on 4-inch, square, lucite culvert model for the Oregon State Highway Commission and the Bureau of Public Roads.

RENCH, WALTER FREEMAN

Roadway and track. Third edition. New York Simmons Boardman Publishing Corporation, 1946 350 p illus. 23 cm. $5.50. 5750

Contents (abridged) Part I, Roadway The right of way Drainage of roadbed and track. Vegetation for banks. Economics of roadway machines. Labor saving methods and devices in roadway work. Part II, Track Program for maintenance of way and structures work. The track obstruction. Power machines and equipment. Labor saving methods in track work. Track materials and their uses. Practice in rail renewals. Practice in rail repair and inspection. Maintenance of main tracks. Maintenance of yards and terminals. Part III, Special problems and duties. Tables. Index.

Note A standard authority on the maintenance of railroad tracks, roadbeds, and rights-of-way Although the practices described are chiefly those employed on the Pennsylvania Railroad, practices that have proved successful on other railroads are also described. In this edition the original material has largely been retained but has been augmented with descriptions of new methods and new mechanical equipment. The new equipment described includes such power machines and labor-saving devices as ditch-diggers, snow removers, and equipment for melting snow at switches. The chapter on track materials has been lengthened by adding information on the care of ties and on repairing rails by welding. The revision and the inclusion of new illustrations account for approximately 80 additional pages. The copies of this book offered as this bibliography goes to press contain a ten-page supplement which covers developments through June, 1948.

RENCH, WALTER FREEMAN

Simplified curve and switch work. Valuable and necessary information for engineers, supervisors and foremen. Fifth edition. New York Simmons-Boardman Publishing Company, 1947 212 p. illus. 18 cm U S. A., $2 00, other countries, $4 50 5751

Contents. Relining of curves with a string. Preliminary study of the curve. Solution of string lining problems. Superelevation of curves. The spiral. The vertical curve. Economics of curves. Essential elements in the design of switch connections. Rules for computing switch dimensions. Rules for various functions of turnouts. Practical considerations in installing turnouts Methods in installing and maintaining switches. Simplified field work in siding location. Special practices. Index.

Note. A standard handbook for railway track foremen and supervisors of maintenance work. It is based on the practice of the Pennsylvania Railroad and other railroads. Complex algebraic calculations are reduced to their simplest form and as nearly as possible to simple arithmetic. Drawings and tables supplement the text. Five editions have been published since 1923. Changes from one edition to another are usually small.

RITTER, LEO JOHN, JR., AND R. J PAQUETTE

Highway engineering New York The Ronald Press Company 1951 721 p. illus. 24 cm (A volume of a series in civil engineering advisory editorial committee Lorenz G Straub and others) $8 00 5752

Contents. Introduction. Highway administration. Highway economics and finance. Highway planning. Geometric design of highways. Highway soil engineering. Drainage and drainage structures. Surveys and plans. Contractual documents and supervision of construction. Earthwork operations and equipment. Bituminous materials. Thickness design of flexible pavements and bases. Stabilized soil roads. Macadam roads. Bituminous surface treatments—rock and soil roads. Road-mix and intermediate-type bituminous pavements. Asphalt pavements. High-type bituminous pavements. Portland cement concrete pavements—design—construction—brick and block pavements. Highway maintenance. Bibliography Index.

Note A textbook for junior and senior civil engineering students for colleges. Various phases of highway engineering are covered with some emphasis on the economic, legal, and administrative aspects. The nature and function of many major pieces of modern construction equipment are described. The bibliography lists 166 references.

APPLIED HYDROLOGY

AMERICAN SOCIETY OF CIVIL ENGINEERS HYDRAULICS DIVISION HYDROLOGY COMMITTEE

Hydrology handbook. Prepared by The Hydrology Committee of the Hydraulic Division Hydrology Committee Merrill Bernard, chairman. Subcommittees Precipitation Merrill Bernard, chairman. Infiltration S. W Jens, chairman. Runoff W B Langbein chairman. Evaporation and transpiration Adolph F Meyer chairman. Ground water storage. Donald M. Baker chairman. New York: American Society of Civil Engineers, 1949 184 p. illus. 23 cm. (American Society of Civil Engineers. Manuals of engineering practice. No. 28) $4.00 5753

Contents: Historical summary. Foreword. Precipitation. Infiltration. Runoff. Evaporation and transpiration. Ground water storage. Glossary.

Note: A manual of technical information and data on the behavior of water as it occurs in the atmosphere, on the surface, and underground. It was published as an aid to engineers concerned with the regulation, control, and utilization of water. The five chapters were prepared by five subcommittees of the Hydrology Committee, each covering a phase of the hydrologic cycle. The 11-page bibliography arranged to correspond to the chapters. The handbook is of especial value to engineers planning flood control and water supply projects and designing land drainage and storm sewers. It is useful also as a source of information on the character and scope of hydrology for engineers outside this field.

FOSTER, EDGAR E.

Rainfall and runoff New York The Macmillan Company 1948 487 p. illus. 24 cm. $9.00. 5754

Contents: The field of hydrology. Atmospheric moisture and its precipitation. Air masses. Storms which produce precipitation. Distribution of precipitation. Frequency of precipitation. Snow. Evaporation. Runoff. Floods. Ground water. The utilization of hydrologic data. Bibliography. Index.

Note: During the past quarter-century the methods which have been developed for collecting and evaluating data relating to rainfall, snowfall, flood peaks, runoff, depth of ground water etc. have reached the proportions of a science. This volume describes the methods and basic principles of hydrology but its primary purpose is to show how statistical methods may be employed in the study and correlation of hydrological data, particularly those dealing with precipitation and runoff. It is assumed that the reader has knowledge of general statistical methods. The work is addressed to persons with professional interest in the subject, especially engineers concerned with flood control, water power, irrigation, and water supply projects.

HOYT WILLIAM G., AND WALTER B LANGBEIN

Floods. Princeton Princeton University Press, 1955 469 p. illus. 25 cm. $7.50. 5755

Contents: Flood problems. Why we have flood problems. Life history of a flood. Damage from floods. Man adaptation to floods. Protection through control of water. Floods and the Constitution. Our present flood-control policy. Basin problems, projects, and plans. Flood history. Bibliography. Index.

Note: An authoritative book on the causes of floods, how they do damage, methods of controlling them, and flood control as a national policy are all discussed. In addition, major flood control programs, accomplished and projected, are described. *Finally* there is detailed description of major floods which have occurred in the United States of America. The book is interesting and informative reading for anyone interested in flood control, and is essential background for any engineer working in the field.

JOHNSTONE, DON, AND WILLIAM P CROSS

Elements of applied hydrology New York The Ronald Press Company 1949 276 p. illus. 24 cm. $5.00. 5756

Contents: Introduction. Collecting and presenting precipitation data. Collecting and presenting runoff data. Elementary relationships between precipitation and runoff. The role of the land. Analysis and synthesis of the hydrograph by unitgraph methods. Flood routing. Infiltration theory and the analysis of the hydrograph. The hydrograph as a function of drainage basin characteristics. Applications of statistical analysis to hydrology. Problems, questions, and special assignments. Subject index. Index of names.

Note: A well-planned textbook designed for students of civil or other branches of engineering who do not plan to specialize in hydrology but who recognize the need of some knowledge of the subject. It provides a good general view of the field, with emphasis on its applications and basic methods. A good part of the book is devoted to methods of recording, analyzing and synthesizing data, and to the application of statistical methods. The unitgraph is discussed as a means for predicting time distribution of flow during flood periods.

LINSLEY RAY K., JR., AND OTHERS

Applied hydrology by Ray K. Linsley jr Max A. Kohler and Joseph L. H. Paulhus. New York McGraw Hill Book Company Inc. 1949 689 p. illus. 24 cm. (Civil engineering series Frederick T Mavis, consulting editor) $9.50 5757

Contents: Introduction. Climate. Temperature in the atmosphere. Atmospheric humidity. Winds. Precipitation. Snow, ice, and frost. Evaporation and transpiration. Streamflow. The basin. Surface retention and detention and overland flow. Soil physics. Sedimentation. Groundwater. Hydrograph analysis. Runoff relations. Runoff distribution. Waves. Streamflow routing. Design criteria. Design and operation of water-control works. River forecasting. Appendices: Graphical correlation. Sources of hydrologic and meteorological data. Physical constants, conversion tables, and equivalents. Index.

Note: An inclusive work which is designed for use both as a text in engineering courses and as a reference book for engineers concerned with the design of highways, airports, storm-sewers, water supply projects, etc. Basic theory, methods of collecting data, and equipment used are discussed, but emphasis is placed on the interpretation of data and practical applications. The treatment requires knowledge of simple statistical methods and of elementary calculus.

MORGAN ARTHUR ERNEST

The Miami Conservancy District. Yellow Springs, Ohio Community Service, Inc., 1951 504 p. illus. 24 cm. $6.50. 5758

Contents: The Miami valley. The Miami river flood of March, 1913. Relief. Emergency government. Flood control. The Ohio conservancy act. Organization of the Miami Conservancy District. The official plan. The engineering staff. The appraisal and assessment. Preparing for construction. By-products and incidentals. Methods and policies of construction. Industrial relations. The construction period. As the years pass. The influence of the Miami Conservancy District. Bibliography. Index of names. Index.

Note: The complete history of a major engineering undertaking is told in this book written by one of its chief engineers. The Miami Conservancy District, organized following the disastrous 1913 flood, has since that date protected the citizens of Dayton, Ohio, and vicinity from a repetition of flood conditions in the Miami River valley. The engineering, social, and legal aspects of this great flood-control project are all treated in full detail. A feature of the table of contents is that the author has there indicated the sections of the book of most interest to the general reader. The work is well illustrated with photographs, maps, plans, and tabulations. A comprehensive bibliography and adequate indexes conclude the book.

THOMAS HAROLD EDGAR

The conservation of ground water A survey of the present ground-water situation in the United States. Sponsored by The Conservation Foundation. New York McGraw

Hill Book Company, Inc., 1951 327 p 24 cm. $7 00 5759

Contents Introduction. Hydrologic principles and basic data. Problems resulting from ground-water development and use. Ground-water problems resulting from land occupancy Our increasing requirements for water Current deficiencies and future needs for effective ground-water development. Better ground-water management, by A. Wolman. Appendixes Pumpage from major ground-water reservoirs in order of magnitude. Index of localities. Selected bibliography of areal ground-water studies. Subject index.

Note. An authoritative study particularly applicable to the United States of America, of current and probable future demands for well water the problems that arise when too much water is pumped from underground reservoirs, and means of conserving and replenishing underground water Included are many case histories of ground-water reservoir exploitation. Related aspects, such as the pollution of underground water by sewage and chemical wastes, are covered. The author argues strongly for government management of important ground-water reservoirs.

TOLMAN, CYRUS FISHER

Ground water New York McGraw Hill Book Company, Inc , 1937 593 p illus. 23 cm $9 00 5760

Contents. Introduction. Résumé of elements of ground-water hydrology and application to ground-water litigation. Brief review of rainfall, runoff, evaporation, and transpiration. Hydrologic properties of water-bearing materials, except soils. The soil. Occurrence of water and forces acting in the zone of aeration. Influent seepage including water spreading. Percolation, ground-water turbulent flow and permeability The water table in granular pervious material. Ground water in fractures and solution openings. Confined water. Geological classification of artesian aquifers. Wells. Oil-field fluids. Springs. The ground-water inventory Ground-water provinces of the United States of America and Hawaiian Islands.

Note A technical treatment of the science of locating and estimating supplies of water underground and their availability for use at the surface, giving in detail the information needed by the student or practicing engineer or geologist who wishes to work out problems in ground water hydrology

WISLER, CHESTER OWEN, AND E F BRATER

Hydrology New York John Wiley & Sons, Inc. 1949 419 p illus. (part col'd) 22 cm. $7 50 5761

Contents Introduction. The hydrograph. The drainage basin. Precipitation. Water losses. Infiltration. Ground water. Runoff. Floods. Stream-flow records. Index.

Note Knowledge of the basic principles and methods for obtaining data regarding fluctuation in stream flow flood conditions, rainfall and runoff, and of the processes governing the depletion and replenishment of water resources have become increasingly important in the fields of civil engineering, forestry and agriculture. This volume, planned for use as college text and based on courses given at the University of Michigan, provides a comprehensive and up-to-date discussion of these principles and methods. The treatment assumes knowledge of simple statistical methods and of the fundamentals of calculus. No formal bibliography is included, but pertinent literature is cited in footnote references.

SANITARY ENGINEERING

AMERICAN PUBLIC HEALTH ASSOCIATION

Standard methods for the examination of water, sewage, and industrial wastes. Prepared and published jointly by the American Public Health Association, American Water Works Association, Federation of Sewage and Industrial Wastes Associations. Tenth edition. New York American Public Health Association, 1955 522 p. illus. 24 cm. $7.50. 5762

Contents (abridged). Part I. Physical and chemical examination of natural and treated waters in the absence of gross pollution. Part II. Physical and chemical examination of sewage, treatment plant effluents, and polluted waters. Part III. Physical and chemical examination of industrial wastes. Part IV. Physical and chemical examination of sludge and bottom sediments in sewage treatment processes and in polluted rivers, lakes or estuaries. Part V. Routine bacteriologic examination of water to determine its sanitary quality. Part VI. Biologic examination of water, sewage, sludge, or bottom materials. Index.

Note. A carefully compiled and well sponsored reference manual. Under each of the headings listed above, it presents detailed procedures (and related directions and information) for laboratory determinations of chemical elements, odors, microorganisms, etc., in water, sewage and industrial wastes. This edition, the first since 1946, not only presents new and revised methods, but has also been reorganized and has a new more readable format. "Nonstandard" and "tentative" methods are no longer included, but only those accepted as standard and a few designated as "tentative." The Federation of Sewage and Industrial Wastes Associations appears as sponsor for the first time.

AMERICAN WATER WORKS ASSOCIATION

Water quality and treatment a manual prepared by the American Water Works Association. Second edition. New York American Water Works Association, Inc., 1951 451 p. illus. 24 cm. $5.00. 5763

Contents: Characteristics of available water sources. Organisms in water. Standards of quality. Pollution and self-purification of surface water supplies. Control of impounding reservoirs. Aeration of water. Coagulants and coagulation. Mixing and sedimentation basins. Chlorination and other disinfection practices. Taste and odor control. Filtration. Scale and corrosion control. Softening. Occurrence and removal of iron and manganese. Treatment of water for steam generation. Chemical treatment of water for physiological benefits. Treatment plant control. Appendixes: The water supply library. American Water Works Association code of practice. Chemicals used in water treatment. Conversion equivalents for water. Index.

Note. An authoritative treatment and reference book sponsored by the chief society in the water supply field in North America. Contemporary standards and practices are compactly described, and the descriptions are supplemented by selected references to the literature. The work is intended for water supply engineers and others who are professionally concerned with water purification and standards of quality for potable water. Important revisions and additions have been made in the present edition.

BABBITT HAROLD E.

Engineering in public health. New York McGraw-Hill Book Company Inc., 1952 582 p. illus. 23 cm. (McGraw Hill civil engineering series Frederic T Mavis, consulting editor) $9.50. 5764

Contents Engineering in public health. Values and costs in public health. Public health administration. Disease and immunity. Epidemiology of communicable diseases. Biostatistics. Diseases transmitted by insects, the lower animals, and birds. Disinfection. Pesticides, poisons, and fumigants. Food sanitation. Milk. Water and the public health. Housing. Plumbing. Ventilation and heating. Light, sound, and odor. Sanitation of hospitals. Sanitation of city air. The city streets. The collection and disposal of municipal refuse. Industrial hygiene. Swimming pools and bathing places. Sewage and industrial wastes treatment. Pollution of surface waters. Rural and camp sanitation. Sanitary engineering in disasters. Index.

Note. This work is intended for the professional engineer practicing in fields related to public health. Although written for persons with basic education in civil engineering and with knowledge of water works and sewerage principles, most of the text would be comprehensible to others with basic training in mathematics and the sanitary sciences. The book was developed principally from notes, references, and lectures used in graduate courses conducted by the author at the University of Illinois over a period of [illegible] years. It is a complete and detailed exposition of the subject, emphasizing the breadth of knowledge required by the sanitary or public health engineer. For the sake of brevity, discussions have been omitted of fundamentals in the major branches of professional engineering, such as the procurement of water and the collection of sewage. References are given at the ends of the chapters.

BABBITT HAROLD E.

Sewerage and sewage treatment. Seventh edition. New York John Wiley & Sons, 1953 674 p. illus. 24 cm. $8 75 5765

Contents Introduction. Developmental and preliminary work. Quantity of sewage. Hydraulics of sewers. Design of sewer systems. Appurtenances. Materials. Loads on buried pipes. Construction of sewers. Trenches and tunnels. Laying and constructing sewer pipe and backfilling trenches. Pumping. Maintenance of sewers. Sewage treatment. Characteristics of sewage. The disposal of sewage. Screening. Sedimentation. Chemical treatment. Septic tanks and Imhoff tanks. Sewage filtration. Intermittent sand filters and other filters. Activated sludge. Sludge handling and disposal. Sludge digestion. Sludge drying and incineration. Industrial wastes. Summary of sewage-treatment processes. Operation. Appendix. Index.

Note A standard text and reference manual for engineering students and graduate engineers. As in the preceding editions, emphasis is on fundamentals rather than details of practice, although illustrations from practical work are freely used. The scope and arrangement of the sixth edition have been retained, but many revisions have been made to incorporate recent developments in equipment design and sewage treatment; thus, there are new sections on the disposal of radioactive wastes, locating lost sewers, detergents, internal combustion engines, and revised data on design standards, scum control, filter loading, etc. Footnote references have replaced the bibliographies of the earlier editions.

BABBITT HAROLD E., AND JAMES J DOLAND

Water supply engineering. Fifth edition. New York McGraw Hill Book Company Inc., 1955 608 p. illus. 24 cm. $8.50. 5766

Contents: Introduction. Hydraulics. Demand for water. Ground water. Location, construction, and maintenance of wells. Meteorology and hydrology. Dams. Intakes. Aqueducts. Streams in pipe. Impounding reservoirs. Pumping stations. Electrical equipment. Pumping engines. Centrifugal, rotary and other pumps. Well pumps. Materials for and the design of pipes. Valves, gates, hydrants, and meters. Metallic corrosion. Storage and distributing reservoirs. Design of distribution systems. Construction and maintenance of distribution systems. Relation of the quality of water to health and to industry. Measures of the quality of water supplies. Living organisms in water. Plain sedimentation. Sedimentation with coagulation. Slow sand and rapid sand filtration. Water softening. Disinfection. Miscellaneous methods of water purification. Appendices. Index.

Note. A standard text on water plant design and on the background knowledge essential to good design. Most of the engineering aspects of water plants are covered in detail, including those aspects of operation within the province of specialists in water supply engineering. There are several hundred diagrams and other illustrations, and many footnote references to the literature. The first edition was published in 1929 and the fourth edition in 1949 In this fifth edition, the organization of the book is the same nevertheless, the book has been adequately revised. Both deletions and additions were made in most of the chapters.

BAKER, MOSES NELSON

The quest for pure water, the history of water purification from the earliest records to the twentieth century New York The American Water Works Association, Inc., 1948 527 p illus 24 cm $5 00 5767

Contents (abridged) From the earliest records through the sixteenth century Seventeenth century Eighteenth and early nineteenth centuries. Four centuries of filtration in France. British contributions to filtration. Inception and widespread adoption of rapid filtration in America. Upward filtration in Europe and America. Drifting-sand rapid filters. Plain sedimentation. Coagulation: ancient and modern Disinfection. Distillation. Aeration in theory and practice. Algae troubles and their conquest. Softening. Cause and removal of color Iron and manganese removal. Taste and odor control. Medication by means of the water supply Bibliography Index.

Note A comprehensive history of civilized man's long quest for potable water It records the story of the many complex problems which underlie the task of providing supplies of pure water for human consumption, especially for the residents of cities. The methods of purifying water which were employed in early times in Europe and America are all described and usually depicted. Careful attention has been given to tracing out the history of such developments. The book ends with a rich bibliography of the literature which shows library location in selected libraries in the U.S.A. and Europe. The author was formerly associate editor of *Engineering news-record* and has had long interest in the subject of water supply

BESSELIEVRE, EDMUND BULKLEY

Industrial waste treatment. New York McGraw Hill Book Company, Inc., 1952 391 p. illus 23 cm $9 00 5768

Contents What constitutes waste problem? Who starts waste-treatment problem? The first steps to take in the solution. The place of the engineer or specialist. Cooperation between enforcing agencies, industrialist, and technician. Factors in the solution of waste problem. The interests concerned in industrial-waste problems. Districts for industrial-waste treatment. Sampling and analysis of wastes. Combining wastes from several plants to reduce costs. The pollutional effect of various wastes. Methods of waste treatment. Equipment for waste treatment and its selection. Coagulants and chemicals. Handling industrial wastes in municipal systems and charges therefor Factors in the development of low-cost plants. Reuse of wastes and recovery of values. Appendixes. Author index. Subject index.

Note. Liquid wastes produced in industrial processes are discussed in this book primarily from the viewpoint of executives and engineers who are concerned with the disposal of wastes, so as not to violate the law pollute streams, and adversely affect public relations. There is of course some discussion of the public health aspects, but this is subordinate. The general phases of the problem and the general methods of solving them are given most of the space, but the treatment of specific types of waste is described in the chapters entitled Methods of waste treatment" and "Reuse of waste and recovery of values." Bibliographies are included. Considerable attention is given to the reclaiming of water from liquid wastes for re-use in manufacturing processes and in cooling.

CONFERENCE ON BIOLOGICAL WASTE TREATMENT

Biological treatment of sewage and industrial wastes Edited by Joseph McCabe and W W Eckenfelder Jr Papers presented at the Conference on Biological Waste Treatment sponsored by Manhattan College New York, April 13–15 1955 Volume I Aerobic oxidation New York Reinhold Publishing Corporation, 1956 393 p illus. 24 cm $10.00 5769

Contents: Part I Theory and mechanism of biological waste treatment. Bacterial nutrition and synthesis, by C. N. Sawyer. Kinetics of biological oxidation, by W W Eckenfelder, Jr and R. F Weston. Principles of biological oxidation, by N. Porges and others. Factors affecting efficiency and solids production in the activated sludge process, by K. Wuhrmann. A study of the equilibria and kinetics of adsorption by activated sludge, by W J. Katz and G. A. Rohlich. Biological flocculation, by R. E. McKinney Biochemical oxidation of glucose by dispersed growth aeration, by N L. Nemerow and J. Ray Factors influencing development of biological flocs, by J. B. Lackey and D. R. Smith. Biophysical processes in slime film and floc formation, by C. E. Renn. The application of the logarithmic equation in biological oxidation, by H. E. Orford. References to Part I. Part II, Aeration—theory and design: The nature of the oxygen transfer coefficient in aeration systems, by W E. Dobbins. Absorption of oxygen in bubble aeration, by C. E. Carver Jr. Aeration and oxygen transport in biological systems—basic considerations, by E. L. Gaden, Jr. Preliminary investigations into the effect of oxygen tension on biological sewage treatment, by H. A. Okun and W R. Lynn. Oxygen supply as the limiting factor in activated sludge purification, by A. Pasveer E aluating proprietary aeration devices, by R. R. Kountz. Theory and development of aeration equipment, by D. E. Dreier. Practical design considerations in the application of aeration equipment, by J A. Tapleshay Aeration of biological systems using mixing impellers, by J Y Oldshue. Mechanical air dispersers for sewage and waste treatment, by A. A. Kalinske. References to Part II. Part III, Sewage treatment A rational approach to the design of activated sludge plants, by T R. Haseltine. Effect of BOD loadings on activated sludge plant operation, by R. F Logan and W E. Budd. The utilization of the kinetics of activated sludge in process and equipment design, by A. W Busch and A. A. Kalinske. Principles of activated sludge operation, by W N Torpey and A. H. Chasick. High-rate filters of biofiltration type and their application to biological treatment of sewage, by R. S. Rankin. Some aspects affecting biological oxidation of domestic sewage, by J W Hood. Final clarifiers and clarifier mechanisms, by C. N Sawyer References to Part III. Part IV Industrial waste treatment Design of waste treatment plants for the pulp and paper industry by T L. Moore and E. A. Kass. Activated sludge at high temperatures and high pH values, by H. W Gehm. Dairy waste treatment plant design, by R. R. Kountz. The evaluation and design of biological treatment facilities for pharmaceutical wastes, by F E. Dyden and others Biological oxidation of petroleum phenolic wast waters, by W K. Ross and A. A. Sheppard. Cannery waste oxidation by activated sludge, by W W Eckenfelder Jr and E. R. Grich. References to Part IV Author index. Subject index.

Note. The papers published in this volume are listed by title and author above. Both the breadth and the detail of the book are apparent. The authors of the papers are eminent specialists, and they have addressed themselves to graduate engineers and scientists who are concerned in practical ways with the treatment of municipal and industrial wastes. The typical paper is a short, concisely written statement based partly on the author's own experience and partly on the literature. A second conference and companion volume of papers on anaerobic treatments is planned.

COX, CHARLES RAYMOND

Laboratory control of water purification a handbook of laboratory practice in the water works plant, prepared particularly for the man who has not had the advantages of extended training in chemistry and bacteriology New York Case-Shepperd Mann Publishing Corporation 1946 386 p. illus. 21 cm. $3 50 5770

Contents I troduction. Principles of chemistry Dissolved oxygen and aeration. Micro-organisms, their identification and control. Control of tastes and odors. Mineral constituents of water Hydrogen ion concentration or pH value. Alkalinity Carbon dioxide. Turbidity Color Residual aluminum. Coagulation. Flocculation, sedimentation and filtration. Residual chlorine. Free ammonia. Chlorination. Hardness. Magnesium. Softening. Iron. Manganese. Iron and manganese removal. Corrosion. Bacteriology

Note: The intended audience for this manual is indicated in its subtitle. The principles of water purification processes are explained and standard treatment equipment is described. Laboratory procedures for making routine tests of various qualities of water are

pos- deal. The material appeared originally as series of articles. Water works engineering, but it has been somewhat revised here. The book contains no index.

EHLERS, VICTOR MARCUS, AND ERNEST W STEEL

Municipal and rural sanitation. Fourth edition. New York McGraw Hill Book Company Inc., 1950. 548 p. illus. 23 cm. $8.00. 5771

Contents (abridged). Communicable diseases. Excreta disposal without water carriage. Excreta disposal with water carriage. Treatment of water. Function of water supply. Refuse disposal. Milk sanitation. Fly control. Rodent control. Milk sanitation. Food sanitation. Plumbing. Ventilation and air conditioning. Lighting. Swimming pools. Rural sanitation. Industrial hygiene. Disinfectants and insecticides. Vital statistics. Public-health organizations. Appendixes: How to make good concrete. Maximum allowable concentrations for various industrial poisons. Index.

Note. A successful college textbook. The first edition was published in 1927, and each revised edition has included improvements and additional material. A broad view is taken of the scope of sanitation; hence, the inclusion of chapters on ventilation and lighting is appropriate. Besides its intended use, the book is suitable for reference use by practicing engineers, public health officials, and others. Many of the discussions have direct application to sanitation problems in rural areas and small villages. A fifth edition was published in 1958, 596 p. $9.00.

FAIR, GORDON MASKEW AND JOHN CHARLES GEYER

Water supply and waste-water disposal. With a chapter on Water chemistry by John Carrell Morris. New York John Wiley & Sons, 1954 973 p. illus. 24 cm. $16.00. 5772

Contents. Elements of water sanitation. Water-supply systems. Waste-water disposal systems. Statistical analysis of quantitative information. Quantities of water and waste water. Elements of hydrology. Rainfall and runoff. Storage and regulation of runoff. Ground water. Collection of surface water. Collection of ground water. Transmission of water. Distribution of water. Water supply and drainage of buildings. Flow in sewers and their appurtenances. Collection of sewage and storm drainage. Physical properties of water. Elements of water chemistry. Biology of water and waste water. Examination of water and waste water. Standards of water quality and unit operations of water and waste-water treatment. ... Chemical coagulation, precipitation, ... and stabilization. Filtration. Biological flocculation and precipitation. Sludge treatment and disposal. Disinfection, destruction of aquatic growths, and removal of odors and tastes. The ... of self-purification of water. Industrial water supply and waste-water disposal. Rural water supply and waste-water disposal ... Appendix. Bibliography. Index.

Note. An engineering college textbook in which broad and fairly detailed view of the fundamentals of present-day sanitary engineering is presented. There is much less description of water works and sewage disposal plants than is customary in such texts. ... such as sewers, filters, water softeners are adequately described as to operating principles. Sewage disposal is presented as an aspect of the broader problem of the collection, treatment and disposal of waste waters. Subjects, such as the hydrodynamics of wells, are treated with thoroughness. The bibliography is extensive.

GARVER, HARRY L.

Safe water for the farm. Washington, D.C. Government Printing Office, 1948. 46 p. illus. 23 cm. (United States. Department of Agriculture. Farmers' bulletin no. 1978) $0.20. 5773

Contents. Importance of safe water supply. Quality of water. Quantity of water required. Sources of water. Ground water. Springs. Wells. Surface water. Pumps and pumping. Water storage. Pipes and pipe fittings.

Note. Superseding Farmers' bulletin 1448, *Farmstead water supply*, the present bulletin was first issued in 1946 and is slightly revised here in 1948. Farmers in need of an abundant and dependable supply of water will find practical information in this pamphlet regarding the sanitary and engineering principles required to provide safe fresh water.

GURNHAM C FRED

Principles of industrial waste treatment. New York John Wiley & Sons, Inc., 1955 399 p. illus. 24 cm. $9 50 5774

Contents. Introduction. The over-all waste picture. Effects of wastes on streams. Effects of industrial wastes on sewerage systems. Criteria of pollution—physical properties—chemical properties—organic and biological properties. Pretreatment of wastes. Physical treatment—sedimentation—flotation—heat transfer operations. Chemical treatment—pH adjustment—oxidation and reduction—coagulation and chemical reaction—adsorption and ion exchange. Miscellaneous treatment methods. Aerobic biologic treatment—biological filtration—activated sludge—lagoons. Anaerobic biological treatment. Ultimate disposal of wastes. Industrial waste disposal programs. Wastes from specific industries. Index.

Note. Primarily addressed to college students of chemical engineering and sanitary engineering, this book is also of interest to graduate chemists and engineers and manufacturers. The basic problems of stream pollution by industrial wastes are explored at some length in the early chapters. From the eighth chapter on, however the book is devoted to treatment methods and waste disposal systems which avoid or mitigate pollution. As shown by the chapter titles, the material is organized according to "unit processes," a feature that will facilitate its use by chemical engineers. The final chapter is a very concise review of the waste problems of specific industries. Selected lists of literature references appear throughout the book and are a special feature of this last chapter.

HARDENBERGH WILLIAM ANDREW

Sewerage and sewage treatment. Third edition. Scranton International Textbook Company 1950. 467 p. illus. 23 cm. (International textbooks in civil engineering Benjamin A. Whisler consulting editor) $6 75 5775

Contents (abridged). Hydraulics of sewers. Pipe sewers. Sewers built in place. Sewer appurtenances. Planning of sewerage systems. Design of sanitary sewers. Design of storm and combined sewers. Pumping of sewage. Construction of sewers. Records and estimates. Fundamentals of sewage treatment. Dilution and irrigation. Grit removal and screening. Sedimentation. Chemical treatment of sewage. Activated-sludge process. Sludge digestion and disposal. Chlorination of sewage. Industrial wastes. Industrial-waste treatment. Selecting the method of treatment and designing the plant. Operation of sewage-treatment plants. Typical design of sewage-treatment plant. Index.

Note. A standard text written by the editor of *Public works magazine*. The treatment is compact, and much attention is given to such practical matters as basic engineering data and construction details of sewer systems. The book has special application to the design of small plants. In this edition, there are revised discussions of industrial wastes, trickling filters, and a few other topics. Citations to recently published literature have been added to some chapter bibliographies.

HARDENBERGH WILLIAM ANDREW

Water supply and purification. Third edition. Scranton International Textbook Company 1952 516 p. illus. 21 cm. $6 75 5776

Contents. General considerations in planning water-supply systems. Consumption of water. Rainfall. Evaporation, percolation, and absorption. Surface water. Ground water. Storage reservoirs. Distributing reservoirs. Gravity conduits. Pipe conduits. Pipe appurtenances. Laying pipe and maintaining lines. Planning the distribution system. Hydraulics of flow. Design of dead-end distribution system. Design of continuous-flow system. Pumps and pumping. Factors in water purification. Physical tests of water. Chemical analysis of water. Bacteriological examination of water. Microscopical examination. Screening. Sedimentation and coagulation. Filtration. Disinfection. Removing dissolved minerals. Control of corrosiveness. Taste and odor control. Fluoridation of water. Water for industrial uses. Typical design of treatment plant. Appendixes. Index.

Note. An established textbook for engineering college students. It has a strong practical slant and is therefore used also by beginning engineers and operators of water plants. Operations such

as the laying of pipe lines are described specifically and the descriptions usually include detailed procedures for suboperations, such as the testing of a new line for leaks. The preceding edition was published in 1943 In the present edition the chapter on *fluoridation of water is new and certain other chapters—for instance* those on laying pipe, on maintaining lines, and on filtration—have been extensively rewritten. Recent literature has been added to the selected lists of references which appear at the ends of many of the chapters.

HIRSCH, A. ADLER

Manual for water plant operators Brooklyn, N Y Chemical Publishing Company, Inc , 1945 386 p illus. 22 cm. $6 50 5777

Contents. General considerations. Section I, Procurement: Ground water Wells. Surface water Section II Methods of treatment. General aims and methods of water treatment. *Storage. Aeration. Coagulation and sedimentation. Filtration. Disinfection.* Section III, Other special treatments: Iron removal. Softening. Corrosion control. Taste and odor removal. Section IV Distribution system Pumping. Reservoirs. Piping and connections. Hydraulic measurement devices. Section V Control tests Plant arithmetic. Chemical tests. Water bacteriology Section VI, Miscellaneous: Operation during emergencies. Records and operator policy Useful literature. Useful water plant data and factors. Index.

Note. The author is an instructor in water purification with the Sectional School on Water Supply and Sewerage maintained by the State Department of Education of Louisiana, and this book grew out of the need for a self-instruction text to supplement the class instruction of that school. The result is a compact, up-to-date survey of water-plant chemistry and techniques that will be useful to many operators of small and medium-sized water-supply systems. A few practice problems are included and there are lists of books, documents, and manufacturers' literature for further reading.

HOPKINS, EDWARD SCOTT, AND WILMER HENRY SCHULZE

The practice of sanitation Second edition Baltimore The Williams & Wilkins Company 1954 466 p illus. 24 cm $8 00 5778

Contents Fundamental concepts. Administration of sanitation programs. The sanitary survey Principles of hydrogen ion concentration. Principles of disinfection. Food sanitation. Sanitation of eating places. Milk and milk products. Public water supplies. Rural water supplies. Refuse disposal. Rural sewage disposal. Urban sewage disposal. Stream pollution and industrial wastes. Air pollution. Ventilation. Housing. Industrial sanitation. Public transportation. Camps and motor courts. Swimming pools. Insect control. Rodent control. Subject index.

Note A manual of fundamental practices according to the best public health standards. Such matters as the sanitary handling of food in restaurants and such devices as incinerators for the disposal of garbage are described. The descriptions are cast in a simple, readable style and are only semitechnical. However the chapters are all supplemented with well-selected references to the technical literature. The book is suited to use as an elementary text in courses offered to medical, nursing and public health students and as a reference book in public health in general libraries. The first edition was published in 1951 In this second edition, written with the aid of another co-author the book has been revised, somewhat reorganized, and considerably expanded. There are now 131 figures, most of which are reproductions of photographs of devices of public health interest or of practices such as the construction of sanitary land fills.

IMHOFF KARL, AND GORDON MASKEW FAIR

Sewage treatment. Second edition New York John Wiley & Sons Inc. 1956 338 p illus 21 cm $7 50 5779

Contents General considerations. Composition of sewage. Screening and skimming. Sedimentation. Chemical precipitation. Elements of biological treatment. Treatment on soil. Trickling filtration. The activated-sludge process. Chlorination. Sewage sludge. Sludge digestion. Sludge gas and its utilization. Sludge treatment, disposal, and utilization. Unsewered household wastes. Water-borne industrial wastes. Self-purification of receiving waters. Disposal of sewage in receiving waters. Appendices References and bibliography Abbreviations and symbols, weights and measures. Index.

Note: A simplified but nevertheless authoritative and useful manual of information on sewage treatment methods and plants. It is addressed primarily to operating personnel and is suitable also for other classes of readers whose needs are served by descriptive treatment. Only simple mathematics is used in the exposition, and the verbal text is written in a clear explicit style. The preceding edition was published in 1940. The organization of this second edition and its purpose are much the same, but new information has been added wherever changes in practice have made it necessary Furthermore, the text has been generally rewritten, and the clarity of many passages and sentences improved. The book is related to but is by no means an adaptation or translation of Imhoff' *Taschenbuch der Stadtentwässerung*, which enjoys wide use in Europe.

MAGILL, PAUL L , AND OTHERS, editors

Air pollution handbook. Edited by Paul L. Magill Francis R. Holden and Charles Ackley Editorial consultant Frederick G. Sawyer New York McGraw Hill Book Company, Inc., 1956 670 p. illus. 24 cm. $15.00. 5780

Contents Air pollution sources and their control. City planning, industrial-plant location, and air pollution. Chemistry of contaminated atmospheres. Physics of the atmosphere. Evaluation of weather effect. Visibility and air pollution. The epidemiology of air pollution. The effects of air pollutants on farm animals. Effect of air pollution on plants. Sampling procedures. Analytical methods. Experimental test methods. Equipment and processes for abating air pollution. Air pollution control by legislation. Table of conversion factors. Index.

Note. In this volume a group of experts in the field, chemists, physicists, biologists, engineers and meteorologists, summarize what is known regarding the causes, effects, and control of air pollution. Both theoretical and practical aspects of the subject are presented, but the major portion of the book deals with the practical effects of air pollution on man, animals and plants, and the remedial measures which have been developed thus far. Each section is complete in itself and includes an extensive bibliography in some cases running to more than 150 references.

MALLETTE, FREDERICK S , editor

Problems and control of air pollution. Proceedings of the First International Congress on Air Pollution Controls, the American Society of Mechanical Engineers. New York Reinhold Publishing Corporation, 1955 272 p. illus 23 cm $7 50 5781

Contents. The growth of public opinion, by H. E. C. Barnes Management aspects of air pollution, by G. R. Fandrey Gaps in the available knowledge on air pollution. Biological aspects of air pollution, by N Nelson. Administrative needs and patterns of air-pollution control, by L. Silverman. Meteorological problems in air-pollution control, by E. W Hewson. Biological systems for the identification and distribution of air pollutants, by J. T Middleton. Associated health implications in air-pollution control, by R. A. Wattleson. Current developments in air pollution: Exhaust gases from diesel engines, by R. F Davis and J. C. Holtz. Research findings in standards of incinerator design, by A. H. Rose and H. R. Crabaugh. Measurement of average particle size in aerosols by light scattering, by D Sinclair The sulfur survey: Action without compulsion, by R. C. Newbury Sulfur dioxide treatment and recovery: The world supply of sulfur by J. C. Cardington. Removal of sulfur dioxide from power-plant stack gases, by R. L. Rees. Recovery of sulfur dioxide from coal combustion stack gases, by L. B. Hein, A. B. Phillips, and R. D. Young. Ammonia process for removal of sulfur dioxide from flue gas, by H. E. Newall. Recovery of refinery sulfur in air-pollution control, by G. R. Smalley and J W Kiehr Sulfur in iron- and steelmaking, by T P Colclough. Recovery and utilization of sulfur dioxide from coke oven gas, by J. K. Kurtz. Use of a sulfur dioxide scrubbing system in air-pollution control, by W C. Lasier Experience in air pollution abroad Influence of the size of the dust outlet on the efficiency of cyclones, by J. J. van E. Terbergen. Air pollution in Holland, by A. J ter Linden. Abietic disease in forest species, by N F dos Santos de Azevedo. Industrial atmospheric pollution in Italy by G. Fanchesi. Air pollution by dust fume, and smoke, by A. P Avy

Note. The many facets of the air pollution problem are discussed by experts in this book. Generally speaking, each author has at-

tional hazard to persons with professional or technical interests or to those who are not specialists in the specific area of his paper. Literature references are included for most papers. There is an index. The section on sulfur dioxide recovery is of interest to chemical engineers.

Metcalf Leonard and Harrison P Eddy

American sewerage practice. Third edition revised by Harrison P Eddy New York McGraw-Hill Book Company Inc., 1915–35 3 v illus. 23 cm. Vol. I II, o.p. vol. III, $10.00 5782

Contents (abridged) Volume I, Design of sewers: The general arrangement of sewerage systems. Hydraulics: Flow of water and sewage. Quantity of sewage. Separate sewers. Precipitation. Storm drains and combined sewers. Gaging storm-water flow in sewers. Sewer pipe. Masonry sewers. The analysis of stresses in sewer sections. Catchbasins and manholes. Regulators. Ventilation. Pumps and pumping stations. Index. Volume II, Construction of sewers. Engineering work and inspection during construction. Excavation. Machinery for trench excavation. Methods of rock excavation. Explosives and blasting. The sheeting and bracing of trenches and tunnels. Purchasing, handling and laying sewer pipe. Construction of brick and block sewers. Construction of concrete sewers. Contracts, specifications and drawings. Operation and maintenance of sewerage systems. Index. Volume III, Disposal of sewage: Characteristics and behavior of sewage. Elements of sewage analysis. Composition of municipal sewage. Pollution and self-purification of natural waters. Sewage disposal by dilution. Sewage disposal by irrigation. Racks and screens. Grit chambers, skimming tanks. Sedimentation. Chemical precipitation. Septic tanks. Contact beds. Disposal of industrial wastes. Operation and maintenance of sewage and treatment plants. Index.

Note For many years this work was recognized as the standard comprehensive treatise on its subject. It is now of historical interest only except for Volume III which was published in a third edition in 1935 and describes some sewage treatment practices still in use.

Nordell, Eskel

Water treatment for industrial and other uses. New York Reinhold Publishing Corporation, 1951 526 p. illus. 24 cm. $12.00 5783

Contents: Industrial water supplies. Dissolved mineral matter. Dissolved gases. Turbidity, sediment, color, organic matter, tastes, odors and microorganisms. Water requirements. Boiler feed waters. Cooling waters. Aeration. Deaeration. Chemical feeders. Sedimentation, coagulation, settling, and filtration. Iron and manganese removal. Zeolite (sodium cation-exchanger) water-softening process. Hydrogen cation-exchanger processes. Demineralization and distillation. Cold lime-soda water-softening processes. Hot lime-soda water-softening process. Silica removal. Appendix section. Index.

Note. The treatment of natural waters in order to render them more suitable for industrial and domestic uses is a subject of wide interest. This is a comprehensive work on the subject, with 120 tables of reference data, approximately the same number of illustrations, and long bibliographies. It is written on a professional level, and it is of interest to chemists, process engineers, and many others whose work involves the use of water in industry

Phelps, Earle Bernard

Public health engineering a textbook of the principles of environmental sanitation. Volume I. New York John Wiley & Sons Inc., 1948. 655 p. illus. 22 cm. $8.50 5784

Contents Man and his environment. Part I, The air contact: Weather and climate—heating. The air supply of enclosed places. The thermal environment of the human body. Heating, ventilation, and air conditioning. Illumination and lighting. Atmospheric pollution—smoke. Insects and insect control, by H. D. Pratt. Part II, The water contact, with C J Velz: Hydrology. Water quality. Water supply. Sewage disposal and the pollution and self-purification of watercourses. Treatment of polluted waters—principles—domestic water supply—sewage and wastes. Rural sanitation. Appendix. Index.

—— Volume II The food contact In collaboration with Walter D Tiedeman New York John Wiley & Sons Inc., 1950 213 p. illus. 22 cm $5.50 5785

Contents: The relation of food to disease. Food control administration. Milk production. Pasteurization of milk. Auxiliary processes and equipment. Plant layout. Milk plant inspection and control. Shellfish production and control. Public eating and drinking places. The handling and disposal of garbage, refuse, and municipal wastes. Rodent control. Index.

Note. In order to indicate the broad scope of this work, the author used the title "Public health engineering" instead of the more customary "Sanitary engineering." The work is intended for public health officers and students who have either engineering or medical backgrounds. It presents a detailed study of man's physical environment, how it may be controlled or modified, and its relationship to man's health, with emphasis on the biological and chemical aspects. It completely supersedes the author's earlier work, Principles of public health engineering, 1925, in which somewhat similar scope and purpose were introduced. The second volume deals with the food sanitation phase, with emphasis on the handling and control of shellfish and milk. Particular attention is given in it to such details as the design and sanitation of valves in dairy plants.

Phelps Earle Bernard

Stream sanitation with a chapter on stream microbiology by James B Lackey New York John Wiley and Sons, Inc. 1944 276 p. illus. 22 cm. $6.00 5786

Contents The life history of a stream. Biology of growth and decay. Aerobic decomposition—oxidation. Anaerobic decomposition—digestion. The oxygen balance. Public health aspects—bacterial pollution. Stream microbiology. Index.

Note A discussion of the manner in which streams, serving various types of communities, become polluted, the forms and tests of pollution, and the natural and artificial means of purification. The book is of interest to public health officials, sanitary engineers, and persons concerned with the conservation of natural resources.

Prescott Samuel Cate, and others

Water bacteriology with special reference to sanitary water analysis by Samuel Cate Prescott, Charles-Edward A Winslow and Mac Harvey McCrady Sixth edition. New York John Wiley & Sons Inc., 1946 368 p. 22 cm. $5.25 5787

Contents (abridged) The bacteria in natural waters. The collection of samples for bacteriological examination of water. Determination of the number of organisms developing at room temperature. Determination of the number of organisms developing at body temperature. Coliform organisms and methods for their detection. Differentiation of organisms of the coliform group. Significance of the presence of coliform organisms in water. Other intestinal bacteria which have been used as indices of pollution. The significance and applicability of the bacteriological examination. Bacteriology of sewage and sewage effluents. Bacteriological examination of shellfish. Appendix: Tables for obtaining the most probable number from dilution data. Index.

Note In its sixth edition, this standard work is essentially a digest of the knowledge of water pollution by bacteria from extraneous sources and of the methods of testing for such pollution. The subject is treated from the public health standpoint; hence, the bacteriology of harmless bacteria indigenous to water is not treated. This edition has been extensively revised. References to recent literature were incorporated in the text, the volume has been reset, and the number of pages has been increased by about 150, as compared to the fifth edition (1931) The bibliography contains 33 pages.

Rudolfs Willem

Industrial wastes their disposal and treatment. New York Reinhold Publishing Corporation 1953 497 p. illus. 24 cm. $9.50 5788

as the laying of pipe lines are described specifically and the descriptions usually include detailed procedures for suboperations, such as the testing of a new line for leaks. The preceding edition was published in 1945 In the present edition the chapter on fluoridation of water is new and certain other chapters—for instance those on laying pipe, on maintaining lines, and on filtration—have been extensively rewritten. Recent literature has been added to the selected lists of references which appear at the ends of many of the chapters.

HIRSCH, A. ADLER

MECHANICAL ENGINEERING

GENERAL

AMERICAN SOCIETY OF MECHANICAL ENGINEERS

ASME handbook, engineering tables. Edited by Jesse Huckert. Sponsored by the Metals Engineering Handbook Board of the American Society of Mechanical Engineers. New York. McGraw Hill Book Company Inc., 1956. 714 p. illus. 25 cm. $12 00. 5793

Contents: Bar stock and shafting—conversion factors—formulas for areas and stress—properties of sections and cylinders. Bearings—[illegible] load analysis. Spur gears. Helical and herringbone gears—bevel gears. Worm gears. Cylindrical fits—standard tapers. Keys and keyseats. Bolts—[illegible]—screw threads—[illegible]—broached, drilled, reamed, and tapped holes. Serrations and splines, by E. [illegible]. [illegible]—washers—wrench [illegible] openings. [illegible], by A. M. Wahl. Aircraft and mechanical tubing—pressure tube—pipe—pipe threads and fittings. Electric motors—graphical symbols—welding. Gaskets—hydraulic standards and symbols—O-rings—packings—seals. Bibliography.

Note: An authoritative compendium, organized under the headings listed above. Most of the tables have been taken from other publications, such as the standards of the American Standards Association, the Handbook of the Society of Automotive Engineers, and manufacturers' literature. The compilation is one of wide scope, but has been planned to supplement other compilations rather than supersede them. The editor's statement on this point reads as follows: [illegible] collection of tables, up-to-date and generally accepted as standard, such are often wanted by engineers and technicians, which are not commonly found in handbooks. Thus, a table of [illegible] functions is included; tables of squares and cubes and trigonometric functions, being readily found elsewhere, are not. Methods for finding the loads on ball bearings are included; the loads that ball bearings can safely carry are not. Data upon bars and tubes suitable for reworking into gears, levers, shafts, or struts are included; the sizes of rolled sections as used in structures are not. The volume is organized in 15 separately paged sections. The number of pages given following the title of this entry was arrived at by adding the pagination of the individual sections.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS

ASME handbook metals engineering design. Edited by Oscar J Horger Sponsored by the Metals Engineering Handbook Board of the American Society of Mechanical Engineers. New York McGraw Hill Book Company Inc., 1953 405 p. illus. 25 cm. $10.00. 5794

Contents: Part I, Selection of material, by H W Gillett. Part II, Mechanical properties of metals in design, by H W Gillett and others. Part III, Mechanical factors influencing corrosion, by H. R. Copson and G. Sachs. Part IV Metallurgical factors in design, by C. E. Sims and others. Part [illegible] Processing considerations in design, by R. W. Bolz and J. A. Brandeton. Part VI, Design procedure, by C. Lipson and others. Index.

Note: A well-sponsored and carefully edited reference book of information useful in the design of structures, machine elements, etc., in metals. The titles of the six parts into which [illegible] is organized are given above. These parts are further subdivided to make [illegible] total of 48 sections in the volume, and each of the sections is the work of [illegible] specialist whose name is given. Thus, Part II contains 29 sections on such topics as "High-temperature considerations in design," "Plasticity considerations in design," "Residual stresses," "Types of stresses," "Surface finish," "Shot peening," "Press-fitted assembly" and "Wear considerations in design." In the typical section, fundamental information and data are presented compactly in [illegible] verbal text, tables and graphs, and literature references are given. In appropriate sections, there are examples of computations typical of the design procedure under discussion.

AMERICAN SOCIETY FOR TESTING MATERIALS AND SOCIETY FOR EXPERIMENTAL STRESS ANALYSIS

Symposium on testing of parts and assemblies presented at the forty ninth annual meeting American Society for Testing Materials, Buffalo, N Y., June 26 1946. Philadelphia American Society for Testing Materials, 1947 86 p. illus. 23 cm. (Technical publication. No 72) $1.50. 5795

Contents: Introduction, by L. L. Wyman. The fatigue strength of lap joints in some magnesium sheet alloys, by H. J. Grover and L. R. Jackson. Fatigue characteristics of magnesium castings, by G. H. Found. Endurance—a criterion of design, by W T Bean. Pneumatic fatigue machines, by F. R. Quinlan. Automotive rear axles and means of improving their fatigue resistance, by O. J. Horger and C. M. Lipson. Stress concentration and the fatigue strength of engine components, by C. Gadd and others.

Note: The principal aim of these papers is to aid in establishing material tests that will more accurately predict the serviceability of mechanical parts before they are placed in service. Charts, diagrams, photographs of test equipment, and photomicrographs of metals are included. Each paper is accompanied by [illegible] report of the discussion of it at the meeting. The volume is directed at metallurgical and mechanical engineers.

BURWELL, JOHN T JR. editor

Mechanical wear being the proceedings of a summer conference on this subject held in June, 1948 at the Massachusetts Institute of Technology Cambridge Mass. Cleveland American Society for Metals 1950 287 p illus. 23 cm. $6.50. 5796

Contents: Dimensional considerations in friction and wear, by C. F. Taylor. Wear in Diesel engines, by C. G. A. Rosen. Wear of automotive engines—cylinders and rings, by P. R. Lane. Fuel and lubrication factors in piston ring and cylinder wear, by A. O. Cattaneo and E. R. Starkman. Chemical aspects of wear and friction, by R. O. Larsen and G. L. Perry. The vapor-lubrication of graphite in relation to carbon brush wear, by R. H. Savage. The wear and damage of metal surfaces with field lubrication, no lubrication and boundary lubrication, by F. P. Bowden and D. Tabor. Wear in steam turbines, by N. L. Mochel. The need for studies of "real" hydrodynamic lubrication, by R. W. Dayton. The dielectric strength of oil film in plain bearings, by C. M. Allen. Gear wear as related to the viscosity of the gear oil, by H. Blok. Surface deterioration of gear

Contents The problem, by W Rudolfs. Stream pollution and self-purification, by H. Heukelekian. Milk products waste, by E. F Eldridge. Canning, freezing and dehydration, by N H. Sanborn. Slaughterhouse and meat packing wastes, by W Rudolfs. The fermentation industries, by C. S. Boruff Corn starch processes, by W D. Hatfield. Wastes from the tanning, fat processing, and laundry soap industries, by E. W Moore. Textile dyeing and finishing, by S. K. Coburn. Pulp, paper and paperboard, by H. W Gehm. Acid and explosives wastes, by R. P Logan. Steel pickling, by R. D Hoak. Plating wastes, by M. G. Barford and J W Masselli. Waste disposal problems in the coal mining industry by W W Hodge. Water disposal problems of the petroleum industry by R. F Weston and others. Treatment and disposal of liquid radioactive wastes, by C. P Straub. Miscellaneous wastes, by W Rudolfs. Index.

Note Eighteen experts in the fields of sanitation and sewage disposal have collaborated to prepare this description of present day methods for utilizing and treating industrial wastes. The problem as a whole and the principles of stream pollution and purification are discussed in the introductory chapters. The remaining chapters deal with the sources of waste materials, recovery techniques, quantity and characteristics of the wastes, and methods of treatment for specific industries. Extensive bibliographies are included, but the book is based on the experience of the authors, rather than on review of the literature of the subject. An authoritative work for industrialists, chemical engineers, municipal officials and others concerned with the disposal of both industrial and domestic wastes.

RYAN, WILLIAM JOHN

Water treatment and purification Second edition. New York McGraw Hill Book Company, Inc., 1946 270 p illus. 21 cm. $5 50 5789

Contents The impurities in water. Sedimentation and coagulation. Filtration. The analysis of water The lime and soda-ash process. Ion exchangers. Boiler feed-water treatment—general considerations. Boiler feed-water treatment—methods used. Disinfection of water Tastes and odors. Miscellaneous treatments. Prevention of corrosion. Appendix. Index.

Note A simple, descriptive manual of water treatment processes and equipment. It is designed for the instruction of engineers who are not specialists in the field, students, and operating men. Added in this edition are new discussions of the use of organic ion exchangers, the processing of boiler feed water and the stabilization of water so as to lessen the deposition of scale in pipe lines.

STEEL, ERNEST W

Water supply and sewerage. Third edition New York McGraw Hill Book Company Inc. 1953 582 p illus 24 cm $8 75 5790

Contents. Introduction. Quantity of water and sewage. Rainfall and runoff Ground water Aqueducts and water pipes. Collection and distribution of water. Pumps and pumping stations. Quality of water supplies. Treatment of water—clarification—filtration. Miscellaneous water treatment methods. Sewerage—general considerations. Amount of storm sewage. Sewer pipes. Flow in sewers. Sewer appurtenances. Design of sewer systems. Sewer construction. Maintenance of sewers. Characteristics of sewage. Sewage disposal. Screens and skimming tanks. Sedimentation of sewage. Sewage filtration. Activated sludge. Sludge treatment and disposal. Miscellaneous sewage treatment problems. Financing and management. Appendix U.S.P.H.S. drinking water standards. Index.

Note A comprehensive work used both as a text by college students f engineering and as reference manual for practicing engineers. By careful combination of related topics and compact writing, a great deal of ground is covered. The second edition was published in 1947 In preparing this third edition, numerous small revisions were made in arious chapters to bring them into conformity with current practice, and the chapter on rainfall and runoff was rewritten. Literature references were added to support the new matter. The author is Professor of Sanitary Engineering on the faculty of the University of Texas.

UNITED STATES PUBLIC HEALTH SERVICE. SANITARY ENGINEERING DIVISION

Manual of recommended water-sanitation practice, recommended by the United States Public Health Service. Prepared by direction of the Surgeon General. Washington, D C. Government Printing Office, 1946 40 p. illus. 23 cm. (United States Public Health Service. Public health bulletin no 296) $0 20 5791

Contents. Introduction. Physical features of water-supply systems and their sanitary protection. Scope of requisite information as to source and protection. Recommended sanitary requirements for water-treatment systems. Recommended general sanitary requirements for water-distribution systems. Discussion of the chemical and bacteriological requirements for potable water as exemplified by the 1946 Drinking Water Standards. References.

Note. A technical committee of U S. Public Health Service officers wrote this manual. Its primary function is to serv as a guide to Public Health Service engineers in evaluating the sanitary features of water supplies with hich they are concerned. In preparing it the committee took advantage of criticisms by various sanitary engineers of the earlier text which appeared in 1941 as Reprint no. 2440 from the Public health reports. The pamphlet, although it "does not have the effect of law regulation, or ruling, should be useful not only to Public Health Service engineers but also to state departments of health and others concerned ith water sanitation.

WRIGHT, FORREST B

Rural water supply and sanitation. Second edition. New York John Wiley & Sons, Inc., 1956 347 p. illus 22 cm. $4 95 5792

Contents (abridged) Part I, Importance of water. The nature and sources of water Development of sources of water. Water treatment. Problems of head and pressure. Pumps, types and principles of operation. Water systems, types and principles of operation. Typical water system installations. Maintenance of water systems. Plumbing systems for homes and farms. Sewage and garbage disposal. Part II, Making joints in copper tubing. Repairing faucets. Determining pipe sizes. Building septic tank. Index.

Note A practical book on water supply and sewage disposal systems and equipment for farm homes and other individual residences located where community systems are not ailable. It is organized so that it may be used as text in college classes in agricultural engineering, and it is also suited to use as reference book by farmers and other rural residents, and by plumbers and contractors who install individual water systems and sewage disposal systems. Basic information, useful engineering data, and specific information on systems and equipment are covered. The title of the chapters in the first part is given above. The second part contains 15 jobs, illustrating various operations, such as the cutting and threading of pipes. The first edition was published in 1939 In this second edition the book has been thoroughly revised in both expository text and illustrations and has been much enlarged.

[illegible] are [illegible] and are supplemented with [illegible]. The [illegible] [illegible] through [illegible]. Older material which has been carried over has been systematically revised, and the newly added material on such subjects as atomic power, gas turbines, jet propulsion, heat pumps, plastic materials, and [illegible] quality control.

LE GRAND RUPERT, editor

The new American machinist's handbook. Based upon earlier editions of "American machinists' handbook," edited by Fred H. Colvin and Frank A. Stanley New York McGraw-Hill Book Company Inc. 1955 1,556 p. illus. 22 cm. $11.00. 5802

Contents: Part 1. Machining methods. Broaches and broaching. Drills and drilling. Files and burrs. Gears, splines, and serrations. Grinding, honing, lapping, and superfinishing. Milling and milling [illegible]. Planing and shaping. Reamers and reaming. Saws and [illegible]. Threading processes and thread systems. Taps and tapping. Turning and boring. Screw-machine work. Part 2. Metal-forming methods. Metal spinning. Press-working and cold-roll forming. Forging, upsetting, and cold heading. Cold working of metals. Die casting. [illegible] of bearings. Part 3. Assembly methods. Arc welding and cutting. Gas welding and oxygen cutting. Resistance welding. Brazing, soldering and soft solders. Part 4. Materials: Steels and irons. Nonferrous metals. Heat-treatment of metals. Cast [illegible] and weights of metal products. Part 5. Finishing of metals. [illegible] processes. Plating and metal coatings. Paints and [illegible]. Electrolytic and chemical finishes for metals. Part 6. [illegible]: Limits, fits, and tolerances. Measuring and gaging equipment. Tapers and dovetails. Part 7. Fastening devices. Bolts, screws, [illegible], and washers. Keys and pins. Part 8. Tool engineering and drafting practice: Jig and fixture details. Drafting practices and [illegible]. [illegible]. Part 9. Machine-tool standards. Standard machine-tool elements. Machine-tool inspection. Part 10. Power-transmission equipment: Chains, V-belts, and motors. Part 11. Mathematics and tables: Mathematics. Reference tables. Index.

Note: This book [illegible] successor to the original American machinists' handbook, rather than [illegible] revised edition of it. The work is still [illegible] reference book intended for use by machinists, machine and product designers, draftsmen and mechanical engineers. However [illegible] has been reorganized and largely rewritten. It has been printed from new type, and both text and tables are more legible than in the latest edition of the predecessor work. The page size also [illegible] larger. Undoubtedly it will become as standard as its widely used predecessor.

LITTLETON CHARLES T

Industrial piping. Special chapter on estimating by R. A. Dickson. New York McGraw-Hill Book Company Inc., 1951 394 p. illus. 23 cm. $9.00. 5803

Contents: Flow sheets, plot plans, and design procedure. Steam piping. [illegible]. Water piping. Oil piping and the Foraking formula. Gas, air, and instrument piping. Alloy piping. Miscellaneous process materials. Insulation. Piping cost estimation, by R. A. Dickson. Index.

Note: A textbook and guidebook for industrial piping presenting the technical information on the subject needed by practicing pipe designers, [illegible], and engineering students. The author has not attempted to cover the theoretical aspects of hydraulics, thermal expansion, and radiation, but sets forth practical methods currently in use for solving such problems as the sizing of pipes and the determination of pressure drop. Much information is presented in tabular form. It is assumed that the user of the book has command of algebra and elementary physics.

MARKS LIONEL SIMEON editor

Mechanical engineers handbook. Fifth edition. New York McGraw Hill Book Company Inc., 1951. 2,236 p. illus. 24 cm. $16.50. 5804

Contents: Mathematical tables. Weights and measures. Mathematics. Mechanics of solids. Friction. Mechanics of fluids. Thermal properties of bodies and thermodynamics. Transmission of heat by conduction, convection, and radiation. Mechanical properties of materials. Mechanics of materials. Vibration problems. Iron and steel. Non-ferrous metals. Fuels. Gas producers and gas cleaning. Industrial furnaces. Machine elements. Gearing. Bearings. Pipes and pipe fittings. Steam engines and turbines. Internal-combustion engines and turbines. Hydraulic turbines. Hoisting and conveying. Automobiles. Railway engineering. Marine engineering. Aeronautics. Building construction. Heating, ventilation, and air conditioning. Illumination. Machine-shop practice. Industrial management and cost accounting. Statistical quality control. Pumps, compressors, and fans. Electrical engineering. Electron tubes and radio. Measuring instruments. Automatic control. Surveying. Mechanical refrigeration. Index.

Note: One of the outstanding engineering handbooks published in the United States of America. More than 50 specialists in the various branches of mechanical engineering have written or revised the signed sections and subsections. Generally speaking, each section includes theory and factual information presented in easy form and also reference data presented in tables. In this edition the general scope and arrangement are the same as in the preceding edition, but the format has been improved by the use of larger type and pages. The inclusion of new or expanded material on such topics as [illegible], dynamics, aircraft jet propulsion, solar heating, heat pumps, dust explosions, [illegible], and atomic power accounts for approximately 400 additional pages.

OBERG ERIK AND F D JONES

Machinery's handbook for machine shop and drafting room a reference book on machine design and shop practice for the mechanical engineer draftsman, toolmaker and machinist. Fifteenth edition Holbrook L. Horton editor New York Industrial Press, 1954 1 911 p. illus 19 cm. $9.00 5805

Note: A reference book which has become a standard fixture in machine shops, drafting departments, and the offices of machine designers. Apparently the publisher has determined that it shall remain a handbook—though a thick one—for the last three editions have contained the same number of pages. In comparison to the 14th edition, the 15th has been revised in several sections, notably in those dealing with gearing, screw threads, [illegible] cutting and [illegible]. Less extensive but nevertheless important revisions have been made in numerous sections, for example, in the tables on alloy steels. In all cases, the new material has been inserted by deleting or condensing material that appeared in the 14th edition. The majority of pages are unchanged.

PLANT ENGINEERING HANDBOOK. Prepared by a staff of specialists. William Staniar editor in-chief. New York McGraw Hill Book Company Inc., 1950 2,007 p. illus. 24 cm. (McGraw Hill Industrial organization and management series L. C. Morrow consulting editor) $17.00. 5806

Contents (abridged) Basic industrial costs and cost reduction. Management engineering. Foundations and reinforced concrete. Materials of construction. Industrial water purification and treatment. Power plants. Refrigeration. Industrial instrumentation and control. Industrial piping. Welding. Industrial-plant power distribution and lighting. Mechanical power transmission. Antifriction bearings. Electrical speed control. Hydraulic power systems. Lubrication. Mechanical packings. Materials handling. Industrial process air conditioning. Crushing and grinding. Drying. Trade waste disposal. Physics in the industries. Graphical mathematics. Vibration control and noise silencing. Industrial containers and packaging equipment. Plastics. Patents and copyrights. Index.

Note A one-volume encyclopedia for plant engineers and others who are responsible for the organization, construction, operation or maintenance of factories and other industrial establishments. Most of the chapters are devoted to engineering and mechanical phases of the large field. However, costs, work simplification, administration of job evaluation plans, etc., are given some space. The treatment of each subject is compact but, in general, there is enough information under each heading to orient the plant engineer and to provide him with the basic facts about the subject under discussion. Literature references are appended for those who wish to read further. The sections and subsections of the book are signed, and the authors, recognized authorities, are affiliated with universities or industrial organizations.

teeth, by J O. Almen. Recent roll tests on endurance limits of materials, by E. Buckingham and G. J Talbourdet. Hardness and its influence on wear by R. Holm. Wear of metals against smooth refractory materials, by L. H. Milligan. Friction and wear of some powder metallurgy bronzes, by J Dedrick and J Wulff. Summary of factors in the wear process, by J T Burwell, Jr Bibliography Index.

Note. The papers in this volume present a broad survey of research methods and current knowledge regarding the causes and control of wear of metals. The authors are specialists associated with universities, research institutions, and industrial corporations and the material has been drawn from reports of laboratory investigations and studies of machines in actual service, as well as from published literature. The book is generously illustrated, and there is a 10-page bibliography It is of interest to mechanical engineers in general and to lubrication experts and machine designers in particular.

CROCKER, SABIN

Piping handbook. Fourth edition New York McGraw Hill Book Company, Inc., 1945 1,376 p. illus 18 cm $12 00 5797

Contents List of collaborators. List of abbreviations. Definitions, formulas, and tables. Fluids—properties of fluids. Metallurgy of piping materials. Pipe, valves, and fittings. Heat insulation. Hangers and supports. Expansion and flexibility Steam power-plant piping. Building heating systems. Plumbing systems. Underground steam piping. Water-supply piping. Fire-protection piping. Oil piping. Gas piping. Refrigeration piping. Corrosion. Hydraulic power transmission piping. Index.

Note The purpose of this manual is to assemble and co-ordinate authoritative data relevant to piping design for engineering and industrial applications. This edition has been enlarged by more than 475 pages, part of which include the new chapters on gas and refrigeration piping, hydraulic power transmission and corrosion. Material dealing with water supply piping and flow of water in pipes has been expanded existing codes, dimensional standards, and specifications have been revised. Previous editions were published under joint authorship ith J H. Walker

GEMANT, ANDREW

Frictional phenomena. New York Chemical Publishing Company, Inc., 1950 497 p. illus 23 cm. $12 00 5798

Contents (abridged) Part A, Frictional processes in general Review of the concept of friction in physics and engineering. Outline of the mathematical treatment of frictional processes. Part B Frictional processes in gases. Theory and experimental facts. Absorption of sound waves and of supersonics. Part C, Frictional processes in liquids Structural viscosity The flow of fluids. Applications of liquid viscosity to electrical insulating liquids, particularly in high-voltage cables. Lubrication. Part D Frictional processes in solids. The plastic flow of solids. Correlation between elastic moduli and viscosity of liquids and plastics. Engineering applications of the plastic flow of solids. Internal friction in solids. Reduction of vibrations by use of materials of high damping capacity Stress-dependent plastic resistance and damping capacity of alloys. External friction of solids. Part E, Problems with solutions. Index.

Note Essentially this is a monograph on the physics of frictional phenomena, but examples of engineering applications are introduced frequently Many topics are discussed rather briefly For example, the chapter on lubrication is only 15 pages long, but bibliography of 36 references to books and papers is appended to it. The treatment is on graduate level. The book is of interest to many fields of science and industry The author is Staff Physicist in the Research Department of the Detroit Edison Company

HEATING, PIPING AND AIR CONDITIONING CONTRACTORS NATIONAL ASSOCIATION

Standard manual on pipe welding [Second edition] New York Heating Piping and Air Conditioning Contractors National Association, 1951 506 p illus. 23 cm. $7 50 5799

Contents. Welding—a tool of the contractor Description of welding processes. Welding equipment maintenance. Selection and training of operators. Scope of pipe welding. Materials and filler metals. Testing and inspection. Code welding—procedures—specifications. Templets and jigs. Layout and fabrication details. Estimating pipe welding costs. Co-ordination of facilities. Fabricating shop organization. Field welding shop organization. Alloy steels—chrome moly-stainless. Aluminum and aluminum alloys. Copper and copper alloys. Nickel and nickel alloys. Cast iron. Lead welding and burning. Hard facing materials. Welding terms. Welding symbols. Tables and formulas Index.

Note. A standard work in which the fabrication of piping installations in factories, office buildings, etc., by the use of welding techniques is treated primarily from the viewpoint of contractors who build piping systems. Techniques of fabrication in the shop and on the job are both described. Most of the space is given over to descriptions of materials and techniques, but other phases such as selling welded installations in competition with those put together with mechanical joints, selection of welding operators, etc., are covered as well. As a source of information on the welding of pipe the book is potentially useful to anyone concerned with the subject, whether he is a contractor architectural engineer, or practical welder.

KELLOGG, M W, COMPANY

Design of piping systems. Second edition. New York John Wiley & Sons, Inc., 1956. 365 p illus. 29 cm. $15.00 5800

Contents Strength and failure of materials. Design assumptions, stress evaluation, and design limits. Local components. Simplified method for flexibility analysis. Flexibility analysis by the general analytical method. Flexibility analysis by model test. Approaches for reducing expansion effects—expansion joints. Supporting, restraining, and bracing the piping system. Vibration—prevention and control. Appendixes. History and derivation of piping flexibility analysis. Derivation of acoustic vibration formulas. Charts and tables. Index.

Note. A substantial treatise and practical manual on the structural design of piping systems, such as are characteristic of present-day oil refineries, steam plants, chemical manufacturing plants, etc. The chapters on flexibility analysis are the heart of the book. They present an approach which has become known as the Kellogg general analytical method. The chapters on the handling of expansion effects, supporting, bracing and the control of vibration are especially useful ones for practical engineers. The first appendix is devoted to an extensive account of the historical development of the analysis of piping flexibility and derivation of the equations used. The third appendix contains 18 charts and tables of reference information. The first edition of the book was published by the M. W Kellogg Company itself in 1941, and has been widely used. In this second edition, the scope of the book has been considerably extended and much useful material added. Also, an index has been provided.

KENT, WILLIAM

Kent's Mechanical engineers handbook twelfth edition. Power volume, prepared by a staff of specialists, J Kenneth Salisbury editor Design and production volume, prepared by a staff of specialists, Colin Carmichael, editor New York John Wiley & Sons, Inc. 1950 2 vol. $10 00 per vol. 5801

Contents (abridged) Power volume: Air by J Kay and others. Heat and heat exchange, by C. O. Mackey and others. Steam, water, and ice, by J K. Salisbury and others. Hydrodynamics, hydraulics, and pumps, by G. E. Barnes and others. Piping, by E. J. Wheeler and others. Steam-generating units, by E. M. Powell and others. Steam turbines and engines, by A. G. Christie and W Tobias. Condensers and cooling equipment, by K. S. Brundige and J. G. Dunn. Combustion gas turbines, by W A. Wilson. Refrigeration and ice-making, by B. H. Jennings. Heating, ventilating, and air conditioning, by J. W James and others. Internal-combustion engines, by J W Anderson and others. Electric power by D. L. Beeman and others. Atomic power by D. Cochran. Instrumentation, by D. P Eckman. Index. Design and production volume General properties of materials, by N B. Pilling and H. W Gillett. Corrosion and corrosion resistance, by F N. Speller and H. H. Uhlig. Nonmetallic materials, by C. R. Austin and others. Mechanics, mechanics, and machine elements, by V L. Doughtie. Vibration and machine control, by R. O. Fehr Fasteners, by C. Carmichael. Mechanical springs, by A. M. Wahl. Machine hydraulics, by L. S. Linderoth, Jr Gearing, by S. L. Crawshaw Control mechanisms, by C. K. S. Smith and others. Metal molding and casting processes, by E. C. Clarke and others. Plastic working of metals, by C. W Obert and others. Dimensional control, by H. S. Shaw and others. Joining of materials, by T D Perry and J E. Falcon. Working of nonmetallic materials, by M W Potts. Index.

Note: A long-established reference book in mechanical engineering. The titles given above are those of sections. Each section contains several parts in which the fundamentals of specific area of mechanical engineering are treated.

[illegible] strength of materials, and related basic subjects. It is [illegible] reference book to graduate engineers and machine [illegible]. Various machine parts are discussed at some length [illegible] of the various details with the designing of specific machine elements, such as are named in the chapter titles. The [illegible] edition was published in 1943. This second edition is the result of considerable reorganization and augmentation of the original text. The length of the book has been extended by approximately 1[illegible] pages.

Bradford, Louis Jacquelin, and Paul B Eaton

Machine design. Fifth edition. New York John Wiley & Sons, Inc., 1947 283 p. illus. 22 cm. $4.50. 5814

Contents: Fundamental definitions and considerations. Friction and lubrication. Bearings and sliding surfaces. Friction clutches and [illegible]. Belts. Fans and [illegible]. Screws and screw fastenings. [illegible] Springs. Flywheels. Miscellaneous machine elements. Tables. Index.

Note: A college textbook designed for use in short, intensive courses in machine design. It includes, therefore, only part of the [illegible] found in more extensive texts, but it does aim to give the student [illegible] good background, and to help him to analyze and [illegible] problems. Most of the revisions in the current edition [illegible] to the [illegible] of metals and to new ideas concerning friction and lubrication. The problems presented by the use of aluminum machine parts are discussed.

Buckingham Earle

Analytical mechanics of gears. New York McGraw Hill Book Company Inc., 1949 546 p. illus. 23 cm. $12.00. 5815

Contents: Conjugate action on spur gears. Conjugate action on [illegible] gears. Toothed, with [illegible], and [illegible]. The involute curve and its properties. Involutometry of spur gears. Involutometry of [illegible] gears. Conjugate action on helical gears. Involutometry of [illegible] gears. Involutometry of spiral gears. Helicoid surfaces. Contact on worm-gear drives. Design of worm-gear drives. [illegible] drives. Conjugate tooth action on bevel gears. The actual form of bevel gears. Spiral bevel gears. Skew bevel or hypoid gears. Gear [illegible]. Efficiencies of gears. Analysis of dynamic loads on [illegible] teeth. Dynamic loads on gear teeth. Beam strength of gear teeth. [illegible] limits of materials. Limiting loads for wear on gears. Index.

Note: An important contribution to the literature of gears. The author [illegible] widely known for his books on gear design. However, this [illegible] deals, not with practical design but with the basis of design. In it are presented clearly mathematical analyses of the actions of gears of the many types [illegible] are mentioned in the chapter titles. [illegible] topics, such as the ways in which gears wear and the functions of lubricants under various conditions, are not discussed. The book [illegible] largely on the author's own work, and there are no literature citations.

Buckingham, Earle

Dimensions and tolerances for mass production. New York. Industrial Press 1954 164 p. illus. 29 cm. $8.00. 5816

Contents: Need for an adequate system of dimensioning with tolerances. Production design. Dimensioning and tolerances for the detail drawing. Tolerances on conditions of size. Tolerances on conditions of form—profiles—tapers and angles. Tolerances on conditions of position. Specifications by means of functional gages. Specifying [illegible] limits. Production design of [illegible] check. Production design of [illegible] valve. Summary. Appendix.

Note: The author of this book has had [illegible] intimate interest in the problems of manufacturing interchangeable machine parts, and his Principles of interchangeable manufacturing, 2nd edition, 1941, is well known. Interchangeability is, of course, based on manufacturing to specified dimensions and shapes within acceptable limits of variation (tolerances). Under the present title he has offered [illegible] both analyses of two problems: (1) the specifying of dimensions and tolerances for parts to be manufactured on [illegible] basis (in contrast to [illegible]) basis, and (2) the representation of these on drawings. He makes specific recommendations as to solutions, although he admits that the specification of certain properties, for instance [illegible] finish, can not yet be standardized. Much of the book appeared as articles in Machinery.

Buckingham Earle

Manual of gear design. New York The Industrial Press 1937 3 v. illus. 28 cm. $3.50 per vol. set $9.00 5817

Contents: Section I, Mathematical tables: Table of trigonometrical functions to eight decimal places and to degrees and hundredths of a degree. Converting degrees into radians. Involute functions. Table for converting minutes into decimals of a degree. Gear ratios and decimal equivalents. Factors of all numbers up to 6000. Section II, Spur and internal gears. Terms and definitions. Plane trigonometry. Involute trigonometry. Spur gears—14½ degree composite system. 14½ degree full-depth involute system. 20-degree full-depth involute system. 20-degree stub involute system. Internal gear drives. Differential gears. Planetary gears. Internal gear type clutches. Backlash. Gear tooth loads. Non-metallic gears. Clock and instrument gears. Section III, Helical and spiral gears. Terms and definitions. Helical gear mathematics. Teeth for helical gears. Internal helical gears. Planetary drives. End thrust and bearing loads. Herringbone gears. Backlash. Speed reducers. Helical gear-tooth loads. Efficiency of helical gears. Spiral gears. Milled and hobbed spiral gears. Load capacity and efficiency.

Note: A useful companion for engineers and technicians who design or cut gears. Formulas are accompanied by practical examples worked out in detail to show the solutions and the way each formula is actually applied in gear-designing practice.

Buckingham Earle

Principles of interchangeable manufacturing a treatise on the basic principles involved in successful interchangeable manufacturing practice. Second edition. New York The Industrial Press, 1941 258 p. illus. 23 cm. $4.50. 5818

Contents: Terms used in interchangeable manufacturing. Machine design in interchangeable manufacturing. Purpose of models. Principles in making component drawings. Practice in making component drawings. Economical production. Equipment for interchangeable manufacturing. Gages in interchangeable manufacturing. Inspection and testing. Manufacturing for selective assembly. Small quantity production. Service factor in interchangeable manufacturing.

Note: A treatise on the basic principles involved in successful interchangeable manufacturing practice in the machine and metal-working fields, covering design, tolerances, drawings, manufacturing equipment, gaging and inspection. The author has gathered the information on which this book is based from a study of many manufacturing plants, both large and small, in the United States of America and Canada, and every method described has been seen in successful operation. In the second edition the chapter on gages in interchangeable manufacturing has been enlarged.

Colvin Fred Herbert and Frank A. Stanley

Gear cutting practice methods of producing gears for commercial use. Third edition. New York McGraw Hill Book Company Inc., 1950 532 p. illus. 23 cm. $7.50. 5819

Contents (abridged): Introduction to gear cutting. Cutting spur gears with circular cutters. Shaping external and internal gears. [illegible] with circular cutters. Shaping external and internal gears and cutters. Worms and worm gearing. Involute and straight-sided splines. Finishing gear teeth and bores. Heat treatment of gears. Gear-inspection methods and equipment. Index.

Note: A well-known book for practical mechanics. It is planned for beginners in gear cutting, but the discussions of practice are carried far enough to make the book of interest to many men with substantial experience in the field. All of the standard practices are covered and, in addition, there are good descriptions of the principal gear-cutting machines. In this edition the length of the book has been increased very substantially. New machinery is described, and there are additional data on many topics, such as carbide-tipped hobs, hobbing speeds, new methods of cutting and finishing gears, and new standards.

WAGENER, ALBERT M , AND HARLAN R ARTHUR

The machinists' and draftsmen's handbook. New York D Van Nostrand Company, Inc., 1945 662 p illus 21 cm $6 95 5807

Contents Symbols and mathematics. Parts of the circle. Areas. Volumes. Geometrical constructions. Weights and measures. Triangulation. Drills. Threads. Spur gearing. Milling tables. Tapers. Miscellaneous tables. Speeds, feeds, and cutting tools. Dies and presses. Metals. Strength of materials. Mechanics. Logarithms. Index.

Note A compact reference work designed to provide the basic information required by machinists and draftsmen in most of their routine assignments. It contains tables, charts, terminology formulas, and directions for calculating standard problems in shop mathematics. The last one-third of the book represents a revision from Peder Lobben's *Machinists' and draftsman's handbook*, New York, 1899

WOODSON, WESLEY E

Human engineering guide for equipment designers Berkeley University of California Press, 1954 253 p. illus 27 cm. $3 50 5808

Contents Design of equipment and workspace. Vision. Audition. Body measurement. Other factors. Bibliography for design applications. Suggested reference library Subject index.

Note. A wide range of information pertaining to the design of mechanical equipment for convenient, efficient and saf use by human operators is contained in this book. Preferred design of numerals for readability preferred shapes of control knobs, tactile coding of controls, good dimensions for seats in airplanes, factors affecting visibility the sensitivity of the senses, and speeds of reactions to various stimuli are some of the topics on which recommendations and data are furnished. Extensi e use is made of graphics in conveying the information. The 16-page bibliography is extensive and classified. Preparation of the book was sponsored by the Elec tronics Design and Development Division, Bureau of Ships, U S. Navy

YORK, JOHN EDMUND

Methods of joining pipe, standard and special joints for different classes of pipes and pipe materials including steel, cast iron, dur iron brass copper, lead, chemical tile vitreous tile, synthetic resin plastic, concrete, glass, transite and wood. New York The Industrial Press, 1949 236 p illus 22 cm $3 00 5809

Contents Screwed joints for ferrous and brass pipe. Flanged pipe joints. Welded and brazed pipe joints. Methods of joining cast iron pipe. Joints for thin wall tubes. Joints for plumbing and chemical-resistant pipe. Joints for vitreous tile and concrete pipe. Joints for transite pipe. Joints for wood pipe. Joints to permit movement. Index.

Note. Not all of the methods which have been devised for joining pipe are described in this book, but most of the practical ones are here. The larger part of the space is devoted t joints for metal pipes, but onmetallic piping systems, such as transite, ood, and glass, are adequately covered. Each type of joint is discussed as to design, construction, advantages and disadvantages. Numerous line drawings show details of joints. American Water Works Association Society of Automotive Engineers, and American Petroleum Institute specifications are frequently cited.

MECHANISM AND MACHINE DESIGN

BEGGS, JOSEPH STILES

Mechanism New York McGraw Hill Book Company Inc. 1955 418 p illus. 23 cm. (McGraw Hill series in mechanical engineering Richard G Folsom, consulting editor) $7.50 5810

Contents Introduction. Position velocity and acceleration. Gears. Cams. Rotary drives. Linkages. Tension and flexural links. Compression links—fluids. Computing mechanisms. The control of mechanisms. Special topics. Newtonian mechanics of rigid bodies. A repertory of mechanisms. Appendixes: Inventions and patents. Placing the decimal point in slide-rule calculations. Glossary Bibliography Index.

Note. An advanced work on mechanisms, or machine elements. It was developed in a course offered by the University of California at Los Angeles to graduate students and to engineers employed in industry Although its coverage is not cyclopedic, it describes a considerable range of mechanisms from gears to calculating machines. Mechanical principles of the mechanisms are described, but the main emphasis is on their properties. These are covered in a manner that combines physical description and mathematical analysis. Books predominate in the classified bibliography but some periodical articles are included.

BERARD, SAMUEL J , AND OTHERS

Principles of machine design By Samuel J Berard, Everett O Waters, and Charles W Phelps. New York The Ronald Press Company, 1955 534 p illus. 24 cm. $7 50 5811

Contents Part I, Introduction: Fundamentals. Engineering materials. Elements of theoretical design. Part II, Screws, bolts, and other fasteners: Screws and bolts. Pins, keys, and other fasteners. Welding processes. Welding design. Part III, Shafting, couplings, clutches, and bearings. Shafting. Couplings and clutches. Sliding bearings. Rolling bearings. Part IV Belt, chain, and gear drives. Belt and chain drives. Parallel-shaft gearing. Bevel gearing. Worm gearing. Screw gearing. Part V Mechanisms and other elements Cams. Linkages. Springs. Brakes. Curved beams and miscellaneous elements. Tables. Index.

Note Written by members of the faculty f Brown University and Yale University this book is designed for the instruction of engineering college students who have completed courses in strength of materials and kinematics. It is an introduction to machine design and covers the standard elements. Welding as method of fastening is treated rather fully and about 100 pages are devoted to gearing. Many worked examples of design problems are included, and there are several hundred illustrations.

BILLINGS, J HARLAND

Applied kinematics for students and mechanical designers Third edition. Princeton, N J D Van Nostrand Company Inc., 1953 352 p illus 23 cm. $5 00 5812

Contents Motion in machines. Mechanisms and centros. Inversion in mechanisms. Parallel and straight-line mechanisms. The phorograph—a device for finding velocities in mechanisms. Centro and component methods for velocity Accelerations in mechanisms. Cams. Spur gearing Bevel and helical gearing. Gear combinations. Flexible connectors. Miscellaneous mechanisms. Automatic control and its mechanisms General references. Appendix. Index.

Note Although this textbook for advanced undergraduate students presents rigorous exposition of principles, it is particularly valuable for its extensive analytical studies of common machine elements. T ch examples, thirty-six pages are devoted to cams, 106 pages to gears. The book is ell illustrated with diagrams and reproductions of photographs of basic mechanisms. The second edition was published in 1943 The newly added chapter on automatic control is the principal change in this third edition.

BLACK, PAUL H

Machine design Second edition. New York McGraw Hill Book Company Inc. 1955 471 p illus 23 cm. $7 75 5813

Contents Introduction. Machine-design computations. Loading induced stresses, and failure. Stress concentration in machine members. Allowable stresses. Members that fail by buckling. Engineering materials. Mechanical fabrication and processes. Detachable fastenings. Springs. Pressure cylinders. Translation screws. Shafting. Belt drives and hoists. Power-transmission chains. Shaft couplings. Clutches and brakes. Spur and parallel helical gears. Gears for nonparallel shafts. Surface finish, friction, and wear Sliding bearings and lubrication. Rolling contact bearings. Metal fits and tolerances Vibration and fixation control Motor selection. Appendixes. Questions and problems. Author index. Subject index.

Note A textbook designed for the instruction of advanced undergraduate engineering students ho has background knowledge of

Mechanical Engineering

[illegible] by coil diameter of from ½ inch to 4 inches. Instructions [illegible] to using the torsion spring tables. Step-by-step examples of how the tables are used. Table of life, stress, and material conversion [illegible]. Chart for determining initial tension in tension springs. [illegible] styles of tension spring ends. Tables of tension springs arranged by coil diameter of from ¼ to 2 inches.

Note: A reference handbook for the use of machine designers and others who, though not specialists in spring design, must occasionally [illegible] design springs as machine elements or for other purposes. [illegible] the tables of compression springs and of torsion springs cover [illegible] considerable range of spring sizes so as to enable the designer to [illegible] quickly to select [illegible] spring of suitable diameter, length, [illegible] from [illegible] table. All of the tables are calculated for springs made of spring steel wire; however, conversion factors are included for adapting the data to springs made of chromium vanadium steel wire, high carbon steel wire, and music wire. Full directions for using the tables, both as specifications and design, are included.

GIBBS, JOSIAH WILLARD

The early work of Willard Gibbs in applied mechanics, comprising the text of his hitherto unpublished Ph.D thesis and accounts of his mechanical inventions. Assembled by Lynde Phelps Wheeler Everett Oyler Waters, & Samuel William Dudley New York Abelard Schuman, Inc., 1947 78 p. illus. 24 cm. (Yale University School of Medicine. Historical Library Publication no. 17) $3.00 5827

Contents: Preface, by L. P. Wheeler. Introduction, by L. P. Wheeler. On the form of the teeth of wheels in spur gearing, by Willard Gibbs: [illegible] dissertation submitted to the Sheffield Scientific School in fulfillment of the requirements for [illegible] Ph.D degree in 1863. Commentary upon the Gibbs monograph, "On the form of the teeth of wheels in spur gearing," by E. O. Waters. An improved railway car brake, by S. W. Dudley. The Gibbs governor for steam engines, by L. P. Wheeler.

Note: The centennial anniversary of the Sheffield Scientific School, Yale University in 1947 was the occasion for the publication of this book by and about Willard Gibbs, the distinguished Professor of Mathematical Physics at Yale University from 1871 until his death in 1903. It reproduces his Ph.D. thesis (Gibbs was one of the earliest recipients in the United States of America of the Ph.D. degree), and gives accounts of two other early contributions by Gibbs in the field of applied mechanics.

HAMPTON ROY E.

Introduction to the basic mechanisms. Annapolis United States Naval Institute, 1956 249 p. illus. 23 cm. $4.50 5828

Contents: Introduction—basic definitions. Vectors. Velocity and acceleration analyses of plane motion. Linkages. Rolling bodies. Cams. Gearing. Gear trains. Flexible connectors. Miscellaneous mechanisms. Bibliography. Answers. Index.

Note: An introductory textbook written by [illegible] member of the faculty of the United States Naval Academy. It offers [illegible] relatively compact treatment with emphasis on basic definitions and principles. The detail that would be included in [illegible] book on the subject written for students preparing for careers in machine design [illegible] lacking. Appropriately, some of the problems illustrate applications to shipboard machinery and the handling of ships. The chapter on "Flexible connectors" deals [illegible] with ropes, chains and belts for the transmission of forces in tension.

HARTMAN JAMES B

Dynamics of machinery New York McGraw Hill Book Company Inc. 1956 283 p. illus. 24 cm. (McGraw Hill series in mechanical engineering Richard G Folsom consulting editor) $7.50. 5829

Contents: Some preliminary considerations. Some principles of dynamics. Inertia forces. Mechanical vibrations. Balancing of machinery. Engine dynamics. Mechanical transients. Dynamics of automatic-control systems. Appendix. Bibliography. Answers to selected problems. Index.

Note: A college textbook in which the topics covered are more advanced than those taken up in the usual introductory courses in dynamics. Vector notation is introduced in the first chapter, and the Laplace transform is introduced in [illegible] late chapter. However the Laplace transform is presented only as [illegible] tool for engineers. Along with the mathematics, the book contains much verbal explanation of basic principles, descriptions of techniques and machines, some worked examples, and numerous problems for the reader to solve. It is addressed primarily to advanced undergraduate students and graduate students of mechanical engineering. It will be of interest to some graduate mechanical engineers as [illegible] refresher or as an introduction to such fields as engine dynamics.

HINKLE ROLLAND T

Kinematics of machines. Englewood Cliffs, N J Prentice-Hall Inc. 1953 231 p illus. 24 cm. $4 75 5830

Contents. Terminology and basic concepts. Equations of motion. Velocities in mechanisms: relative motion, and transmission of motion. Velocity polygons. Accelerations, instant centers and resolution. Velocity and acceleration graphs, special constructions, analytical methods. Cams. Rolling contact. Gearing. Flexible connectors. Gear trains, translation screws. Miscellaneous mechanisms. Index.

Note: A well-organized textbook for engineering college students who have completed basic courses in engineering mechanics. Its purpose is to introduce such students to the analysis of problems in the relative motion of machine parts. It is compact and written in [illegible] terse but not difficult style. Analytical techniques, such as the use of velocity and acceleration polygons, are clearly explained and numerous examples are included. The chapter on miscellaneous mechanisms considers four-bar linkages, universal joints, escapements, and [illegible] number of other ingenious mechanisms. The author is Professor of Mechanical Engineering on the faculty of Michigan State College.

HOLOWENKO A. R.

Dynamics of machinery New York John Wiley & Sons Inc., 1955 464 p. illus. 24 cm. $7.50. 5831

Contents. Introduction. Velocities and accelerations. Relative velocities. Application of the relative velocity equation. Special methods of velocity solution. Relative accelerations. Application of the relative acceleration equation for two points on [illegible] rigid link. Acceleration equation for two coincident points. Special methods of acceleration solution. Equivalent mechanisms. Review of static forces and graphic statics. Static forces in machines. Inertia forces. Dynamic analysis. Analytic determination of accelerations in slider-crank mechanism. Flywheel analysis. Balancing rotating masses. Balancing machines. Balancing masses reciprocating in [illegible] plane. Balancing masses reciprocating in several planes. Vibrations in shafts. Gyroscopes. Index.

Note: A textbook designed for undergraduate engineering students. Its scope and the detail of the exposition reflect the increased attention now paid to dynamics in curricula on machine design. The subject is treated analytically and proofs are included. There is much emphasis on the use of free-body diagrams as [illegible] graphic approach to solution of dynamics problems. An insight into the problems of graduate machine designers working on today's high-speed machinery is afforded by discussions of the balancing of aeronautical and automotive engines and by [illegible] chapter on gyroscopic actions in high-speed engines as airplanes, automobiles, etc.

HRONES JOHN ANTHONY AND GEORGE L. NELSON

Analysis of the four bar linkage its application to the synthesis of mechanisms. New York Technology Press of the Massachusetts Institute of Technology and John Wiley & Sons, Inc., 1951 730 p. 44 cm. $22 00. 5832

Note: The 730 large-scale charts comprising this volume show the trajectories of various points on the connecting rod of [illegible] four-bar linkage as the driving crank of the linkage rotates through 360°. For each set of link ratios, there are five charts from which the displacement and velocity of points on [illegible] given linkage may be read directly. Introductory pages explain how the charts were compiled and the manner of their use. The book is of interest to mechanical engineers and machine designers.

CORNETET, WENDELL H , AND DANIEL W FOX

Applied fundamentals of machines Bloomington McKnight & McKnight, *1944* *323* p illus 25 cm. $3 00 5820

Contents (abridged): Properties of materials. Measurement. Precision instruments. Theory of machines. Pulley systems. Gears and gearing. Hydraulics. Elasticity Viscosity Surface tension. Lubrication. Solutions and emulsions. Internal combustion engines. Forces. Heat. Refrigeration. Chemistry of combustion. Petroleum.

Note. A beginner's textbook and laboratory manual suitable for use in vocational schools. The treatment is designed for students who are taking short courses in preparation for or along with, work in industry The work is well illustrated and is supplemented with questions for the student to answer and lists of related material.

CROSSLEY, F R ERSKINE

Dynamics in machines. New York The Ronald Press Company, 1954 463 p. illus. 24 cm $7 50 5821

Contents Introductory kinetics. Equations of motion. Simple harmonic motion. Balance of rotors and critical speeds. Vibrations—damped and forced. Three-dimensional rotation. Static and dynamic forces in machines (rigid) Flywheels and engine balancing. Flexible machine members in motion. Governors. Answers to selected problems. Index.

Note A college text designed for advanced undergraduate students. It is an introduction to the dynamic analysis of machines. Appropriately the presentation is mathematically simple and is related to familiar machines, for example, the V-8 internal combustion engine The author is Assistant Professor of Mechanical Engineering in Yale University

DAYTON, RUSSELL WENDT, editor

Sleeve bearing *materials A series of* educational lectures on sleeve bearing materials presented to members of the A S M during the twenty-eighth National Metal Congress and Exposition, Atlantic City Cleveland American Society for Metals, 1949 256 p. illus 23 cm. $5 00 5822

Contents Part I, The characteristics of bearing materials Fundamental considerations concerning the behavior of bearings, by R. W D yton. Some general comments on bearings, by C. E. Swartz. British thought and practice how they differ from American, by W H Tait. Discussion of paper by W H. Tait, by S. D. Heron. Part II, Specific bearing materials Newer bearing materials, by I. C. Sleight and L. W Sink. Aluminum alloy bearings—metallurgy design and service characteristics, by H. Y Hunsicker. Porous metal bearings, by A. J Langhammer. Monel Duras 100 engine bearings, by J A. Lignian. Cast bronze bushings, by L. M Long. Discussion of Satco metal, by R. J Shoemaker Discussion of wrought (or rolled) bushings and bushing materials, by H. P Croft and others. Discussion of cast bronze bearings, by J S. Toursey Part III, Bearing structures and fabrication methods Mechanical features of steel-backed bearings, by R. Cruikshaw Lubrication, by R. Cruikshaw and J Mearath. Bronze-backed bearings, by B. J Emery Electroplated bearings, by R. A. Schaefer Preparing cast iron surfaces for bonding, by J H. Shoemaker Part IV Factors involved in the application of bearings The selection of bearing materials, by A. F Underwood. Aircraft engine bearings, by J Palsulich and R. W Blair Selection of bearing materials in the electrical industry by D F Wilcock. Railroad journal bearings, by E. S. Pearce. Index.

Note The papers collected in this book are addressed to metallurgists, engineers, and other men who have a practical interest in bearings and bearing materials. Several of these are supplemented by summaries of the discussion that followed their original presentation. Six of them contain lists of related literature.

DOUGHTIE, VENTON LEVY AND WALTER H JAMES

Elements of mechanism. New York John Wiley & Sons, 1954 494 p illus 22 cm. $6 00 5823

Contents Introduction. Motion. Velocity analysis. Acceleration analysis. Linkages. Transmission of motion by direct contact. Cams. Bodies in pure rolling contact. Gears. Belts, ropes and chains. Trains. Miscellaneous mechanisms. Laboratory problems. Index.

Note. The lineage of this book goes back to Professor Peter Schwamb's anonymously issued *Notes on the elements of mechanism* (1885) The first trade edition appeared in 1904, with Professor A. L. Merrill as co-author There are three authors of the third edition (1920) Professor W A. James being the newcomer. All three are members of the faculty of Massachusetts Institute of Technology Professor Doughtie's name appeared first on the title page of the sixth edition, published in 1947 Apparently because the present book represents such an extensive revision and reorganization, it is presented as a new work rather than a new edition however It is still an introduction for engineering students to the analysis of mechanical movements. All of the common types of mechanisms are described in passing, but the emphasis is on the use of physics and mathematics in studying cams, gears, linkages etc. The "Miscellaneous" chapter covers a variety of such mechanisms as pulley blocks, jack screws, ratchet wheels and clock escapements.

DUDLEY, DARLE W

Practical gear design. *New York* McGraw Hill Book Company, Inc., 1954 335 p. illus *24* cm $7 00 *5824*

Contents Gear-design trends. Preliminary design considerations. Design formulas. Gear materials. Gear-manufacturing methods. Design of tools to make gear teeth. The kinds and causes of gear failures. Special design problems. Index.

Note A manual for such readers as engineers engaged in the design of machinery and draftsmen responsible for some mechanical designing. It provides view of the field, with special emphasis on those factors hich are most important in selecting gear types and materials and in designing gears for specific uses. All kinds of gears are described, from simple stamped gears used in toys and cheap clocks to complex marine gearing. Techniques of gear manufacturing are covered in the same inclusive way The chapter on gear failures is an important one for the nonspecialist designer Each chapter has its literature references for those readers who need more specialized information. The author is Supervisor of Gear Advance and Development Information for the General Electric Company

FAIRES, VIRGIL MORING

Design of machine elements. Third edition. New York The Macmillian Company, 1955 550 p illus. 23 cm. $10 00 5825

Contents: Stress analysis—simple stresses. Materials and their properties. Tolerances and allowances. Variable loads and stress concentrations. Screw fastenings. Thin-shell cylinders, riveted joints. Springs. Columns and power screws. Combined stresses. Shaft design. Keys and couplings. Journal and plane-surface bearings. Ball and roller bearings. Flat belts and pulleys. V-belts, chains, and wire ropes. Spur gears. Helical gears. Bevel gears. Worm gearing. Brakes and clutches. Welding. Miscellaneous problems. List of references. Index.

Note A long-established textbook for college students of engineering. The first edition was published in 1934 and the second edition in 1941 In its third edition the book is an introduction to machine design, but substantial one It teaches the basic theory and relates it to practical design. Numerous worked examples of design computations are included in the expository matter There are 403 figures, 54 tables, and nine-page list of references. The publisher makes available with the book J. G H. Thompson and V M. Faires, editors, Case studies in engineering design, third edition, January 1955 [illegible] pages, pamphlet in which 111 studies of specific problems in engineering design are briefly discussed.

GAYER JOHN D , AND PAUL H. STONE, JR.

Helical spring tables an easy to-use index of ready-designed compression and tension springs from which selections may be made with minimum calculation. New York The Industrial *Press 1955 165 p. 24 cm* $5.00. 5826

Contents Simplifying helical spring design. How the data were compiled. Instructions for using the compression spring tables. Step-by-step examples of how the tables are used. Table of life, stress, and material correction factors. Tables of compression springs ar-

MAURER, EDWARD ROSE, AND OTHERS

Mechanics for engineers statics and dynamics by Edward R. Maurer Raymond J Roark, and George W Washa. New York. John Wiley & Sons, Inc., 1945 425 p. illus. 22 cm. $4.50. 5839

Contents: Force and force systems. Composition and resolution of forces. Forces in equilibrium. Simple frameworks. Friction. Center of gravity and centroid. Cables. Rectilinear motion. Curvilinear motion of a particle. Rotation of a rigid body. Plane motion of a rigid body. D'Alembert's principle. Work, power, energy. Momentum and impulse. Three-dimensional (or mixed) motion of a rigid body. Appendix. Systems and dimensions of units. Moment of inertia and radius of gyration. Mechanical vibrations. Problems. Tables. Index.

Note: The revision of a long-established engineering college text (the last edition was published in 1931) has been recent and almost completely rewritten, as compared to the fifth edition (1928). Topics introduced for the first time are virtual work and mechanical vibrations; topics amplified or treated in a new way include dynamics, relative motion and relative motion, and d'Alembert's principle. Many new problems are introduced and answers are now furnished for most of the more difficult ones. Throughout, sentences and paragraphs have been revised and reworded for the sake of clarity. Earlier editions were entitled Technical mechanics.

PETERSON R. E.

Stress concentration design factors charts and relations useful in making strength calculations for machine parts and structural elements. New York John Wiley & Sons, Inc., 1953. 155 p. illus. 29 cm. $8.50. 5840

Contents: List of symbols. Definitions and design relations. Grooves and notches. Shoulder fillets. Hole in a plate or shaft. Miscellaneous design elements. Appendix: Stress relations for member with single groove or notch. Application of Mohr theory for fatigue of brittle materials. Derivation of relations for limited number of cycles. Derivation of combined stress relations. References.

Note: Primarily a reference book for the office libraries of engineers engaged in machine and structural design. It is devoted to the factors of stress concentration caused by holes, grooves, notches, keyways, fillets, etc., in machine parts and structural elements. The heart of the book is a series of graphs in which stress concentration factors for a variety of dimensions are presented. The information presented graphically is discussed in an accompanying text, which includes the necessary mathematical computations. The text and data contained in it are keyed to the bibliography of 174 literature citations. The author is manager of the Mechanics Department of Westinghouse Research Laboratories.

ROTHBART HAROLD A.

Cams design, dynamics, and accuracy New York. John Wiley & Sons, Inc., 1956 350 p. illus. 23 cm. $9.50. 5841

Contents: Introduction. Basic curves. Cam size determination. Cam profile determination. Additional cams and followers. Advanced curves. Polydyne cams. The dynamics of high-speed cam systems. Force analysis. Surface materials, stresses, and accuracy. Special cams and mechanisms. Appendix. Index.

Note: A broad and at the same time detailed treatise on cams and associated mechanisms, particularly followers and follower springs. The subject is covered from the viewpoint of specialists in machine design. There is considerable emphasis on the dynamics of cam systems. Often several rather than one method of attack on each problem, as the analysis of follower response are presented. Such aspects as the influence of materials and conditions of surfaces are also thoroughly explored. The chapter on special cams presents descriptions and diagrams of a number of unusual cam systems, for instance, variable-angular-velocity cams. The book is well illustrated and includes citations of related literature.

SAHAG, LEON MARK

Kinematics of machines. Revised printing. New York. The Ronald Press Company 1952. 249 p. illus. 24 cm. $4.50 5842

Contents: Fundamental conceptions. Motion in machines. Instant centers. Linear and angular velocities. Accelerations in machines. Velocity and acceleration diagrams. Cams. Rolling friction surfaces. Gears. Gears on intersecting and nonintersecting shafts. Gear trains. Flexible links. Other useful mechanisms. General instructions for drawing room problems. References. Index.

Note: A text designed for use in introductory but thorough courses offered to mechanical engineering students. The treatment takes into account the present-day demands upon the basic knowledge of machine designers due to the increasing use of complex and high-speed machinery. Problems in accelerations and velocities are solved graphically rather than by analytical mechanics. The major change in this revised printing is a thorough rewriting of the chapter on accelerations. This chapter is now 12 pages longer. The additional pages have been inserted without alteration in the page numbers in the balance of the book.

SHAW MILTON C AND E. FRED MACKS

Analysis and lubrication of bearings. New York McGraw Hill Book Company Inc., 1949 618 p. illus. 24 cm. (McGraw Hill publications in aeronautical science Jerome C. Hunsaker consulting editor) $11.00. 5843

Contents: Principal notation. Introduction. Bearing-load analysis. Dimensional analysis. Aircraft-engine bearing loads. Hydrodynamic lubrication. Dynamically loaded bearings. Journal bearings. Hydrodynamic thrust bearings. High-speed considerations. Rolling-contact bearings. Boundary considerations. Bearing evaluation. Appendix. Problems. References and selected bibliography. Index.

Note: A comprehensive technical treatise designed for use both by advanced students of engineering and practicing engineers. Instead of assuming bearings rotating at constant speeds under ideal dynamic conditions, the authors have endeavored to present an analysis of bearing conditions as they actually exist in operating machinery. The analysis of bearing loads in reciprocating aircraft engines is especially detailed. Many subtopics, such as testing machines for bearings and special kinds of lubricants, are discussed though not mentioned in the table of contents. The selected bibliography runs to nearly 430 entries and contains references to books, periodicals, and a few patents.

SHIGLEY JOSEPH EDWARD

Machine design. New York McGraw Hill Book Company Inc., 1956 523 p. illus. 24 cm. (McGraw Hill series in mechanical engineering Richard G. Folsom, consulting editor) $7 75 5844

Contents: Part 1, Fundamentals of machine design: Introduction. Stresses in machine parts. Deflection of machine parts. Materials and their properties. Principles of machine design. Part II, The design and selection of machine elements: The design of screws, fasteners, and joints. Mechanical springs. Antifriction bearings. Lubrication and journal bearings. Spur gears. Helical, worm, and bevel gears. Clutches, brakes, and couplings. Flexible machine elements. Miscellaneous machine elements. Appendix. Index.

Note: In this introductory textbook for engineering-college students, there is more than the usual emphasis on the scientific knowledge that underlies successful machine design. However, the standard elements of machines, such as are named in the chapter titles, are all included and are discussed as to their properties, uses, methods of manufacture, as well as considerations in design. A considerable range of engineering data is presented in tables. The volume has an attractive format and is well indexed.

SOCIETY OF AUTOMOTIVE ENGINEERS INC.

Manual on design and application of helical and spiral springs for ordnance. Second edition. New York Society of Automotive Engineers, Inc., 1945 38 p. illus. 28 cm. $8.00. 5845

Contents: Introduction. Fundamental considerations. Factors of importance in spring design. Spring materials and maximum design stresses. General spring tolerances. Spring design formulae. Appendix.

—— Manual on design and application of leaf springs. New York Society of Automotive Engineers, Inc., 1945 89 p. illus. 28 cm. $5.00. 5846

JEFFERSON, THEODORE BREWSTER, AND WALTER J BROOKING

Introduction to mechanical design. New York The Ronald Press Company, 1951 612 p illus 24 cm $7 00 5833

Contents Glossary Abbreviations. Machine types and their functional design. Fundamental concepts and terminology Engineering materials and their properties. Forming and fabrication in design. Bolted and riveted connections, screws. Welded fastenings and joints. The machine frame and its elements. Shafting, keys, and couplings. Bearings and lubrication. Friction gearing, brakes and clutches. Gears and flywheels. Belt, rope, and chain drives. Cams, linkages, and miscellaneous devices. Springs. Piping and containers for machines. Styling, streamlining, and finishing of machines. Standard machine elements and standardizing agencies. Appendix. Index.

Note. An outstanding textbook in which the authors have made a special effort to present the subject so that the reader will get a clear picture of actual problems and operations in the professional designing of machines. The book won the first award in the Machine Design Division of the Competitive Program for Modernized Textbooks on Design sponsored by the James F Lincoln Arc Welding Foundation. Recently developed machine elements, such as ball-bearing sleeve bearings, are covered, as well as the expected order elements. The book is exceptionally well illustrated, and there are approximately 100 tables of engineering data.

JONES, FRANKLIN DAY

Gear design simplified, a series of gear-designing charts illustrating by simple diagrams and examples the solutions of practical problems relating to spur gears straight tooth bevel gears, spiral bevel gears, helical gears for parallel shaft drives, helical (spiral) gears for angular drives, herringbone gears and worm gears. Second edition. New York The Industrial Press, 1940 139 p illus. 29 cm. $4 50 5834

Contents Gear-tooth standards. Spur gears—full depth teeth. Spur gears—stub teeth. Internal gearing. Bevel gears for right-angle drives. Bevel gears—acute and obtuse angles. Straight-tooth bevel gears—Gleason system. Spiral bevel gears—Gleason system. Bevel gears of parallel-depth type. Helical gears. Herringbone gears. Worm gearing. Gearing ratios and speeds. Power-transmitting capacity Definitions of gear terms. Checking spur gears by chordal measurement. Steels for industrial gearing. Index.

Note. A book of working rules and formulas in gear design for shop men and designers. Gear problems are presented in simple chart forms, and worked-out examples of gear design illustrate the application of rules in obtaining the essential dimensions, angles, or other values. Material new in this edition includes definitions of gear terms, table for spur gear sizes, and a discussion of steels for industrial gearing.

JONES, FRANKLIN DAY, editor

Ingenious mechanisms for designers and inventors New York The Industrial Press 1930–36 2 v illus 23 cm $6 50 per vol. 5835

Contents (abridged) : Cams and their applications. Special cam designs. Intermittent motions. Tripping or stop mechanisms. Reversing mechanisms for rotating parts. Overload relief mechanisms and automatic safeguards. Interlocking devices. Driving mechanisms for reciprocating parts. Reciprocating motions derived from cams, gears, levers, and special mechanisms. Quick-return motions for tool slides. Speed-changing mechanisms. Differential and straight line motions. Hydraulic transmissions for machine tools. Automatic feeding mechanisms and hopper design. Design of magazine loading attachments, carriers and slides. Special transmissions and over running clutches. Self-centering pivoted levers and sliding members. Multiple-lever mechanisms. Val diagrams. Index.

—— Volume III. Edited by Holbrook L. Horton New York The Industrial Press 1951 536 p illus. 24 cm $6 50 set of 3 vol. $16 00 5836

Contents Cam applications and special cam designs. Intermittent motions from gears and cams. Intermittent motions from ratchet and Geneva mechanisms. Overload, tripping, and stop mechanisms. Locking, clamping, and locating devices. Reversing mechanisms of special design. Reciprocating motions derived from cams, gears, and levers. Crank actuated reciprocating mechanisms. Variable stroke reciprocating mechanisms. Mechanisms which provide oscillating motion. Mechanisms providing combined rotary and linear motions. Speed changing mechanisms. Speed regulating mechanisms. Feed regulating, shifting, and stopping mechanisms. Automatic work feeding and transfer mechanisms. Feeding and ejecting mechanisms for power presses. Hoppers and hopper selector mechanisms for automatic machines. Miscellaneous mechanisms. Index.

Note: The first two volumes of this series have been invaluable to machine designers and inventors. The mechanisms have been selected because they are ingenious and have stood the test of practical use. The third volume contains only mechanisms that did not appear in the first two volumes, otherwise its organization and scope are identical. They are not only described but their essential and unique elements are diagrammed in line drawings.

LAUGHNER, VALLORY H , AND AUGUSTUS D HARGAN

Handbook of fastening and joining of metal parts. New York McGraw Hill Book Company, Inc., 1956 622 p. illus. 29 cm. $15 00. 5837

Contents Screw threads and pipe threads. Screws, bolts, and nuts. Locking nuts, washers, and retaining rings. Practical considerations in the design of screw fastenings. Riveting, stitching, and staking. Welding with pressure. Gas, arc, and thermit welding. Brazing and soldering. Adhesives and adhesive-bonded joints. Collars, couplings, and clutches. Keys, splines, and interference fits. Other assembly methods, integral fastenings, and specialty fasteners. Supplement. Index.

Note. A reference book of particular interest to designers of machines and other manufactured products. All kinds of joining and fastening methods and devices applicable to metal are covered, including stitching, clamps, spring clips, turnbuckles, etc., in addition to those mentioned in the chapter titles. A considerable part of the space is devoted to tabulated reference information, such as the dimensions of standard bolts. There is also good deal of descriptive text in which methods and devices are described and discussed as to characteristics, advantages and disadvantages. The "supplement" listed in the contents contains illustrations and descriptions of about 1,500 unusual though practical "ideas" for fastening and joining. The volume is well indexed.

MALEEV, VLADIMIR L , AND JAMES B HARTMAN

Machine design. Third edition. Scranton International Textbook Company, 1954 706 p illus 24 cm $8.50 5838

Contents. Part I, Stresses and materials. Introduction. Static stresses in machine parts. Dynamic stresses and stress concentrations. Engineering materials. Machine design calculations. Part II, Manufacture of machine parts. General manufacturing considerations. Design of castings. Design of weldments. Design of riveted constructions. Design of forgings. Part III, Fastenings: Screw fastenings. Keys, pins, and cotters. Press, shrink, and friction joints. Springs. Part IV Details for handling fluids: Cylinders, heads, and cover plates. Packings and seals. Part Hoisting machinery: Chains and wire ropes. Brakes. Screws for power transmission. Part VI, Power transmission machinery Shafts. Couplings and positive clutches. Friction clutches. Bearings with sliding contact. Bearings with rolling contact. Crankshafts. Flywheels. Belt drives. Chain drives. Friction gearing. Straight and helical spur gearing. Bevel gearing. Worm gearing. Screw gearing. Appendix. Index.

Note This book has been outstanding among engineering college texts in machine design since the publication of the first edition in 1939 It is introductory to the field but the exposition is carried far enough to prepare the reader for practical work. In addition to the expected exposition of principles and procedures, large amount of information of reference and semi-reference nature has been included. This third edition is the first one to bear the name of co-author In comparison to the second edition (1944) the book is 125 pages longer contains several new chapters and many revised or added sections in chapters carried over.

ating gears. Incomplete pairing. Graphic solutions. Layouts. Mating gears in contact and instantaneous motion. Relative velocities in link work. Velocity diagrams. Wrapping connectors. Direct-contact mechanism. Toothed wheels or gears. Trains of mechanism. Cams. Links.

Note: Intended as a companion volume to the author's *Machine design* (see above), this book emphasizes the fundamental theory of the subject. An elementary knowledge of trigonometry and some ability in mechanical drawing are assumed.

LUBRICATION

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on functional tests for ball bearing greases. Presented at the fifty first annual meeting, American Society for Testing Materials, Detroit, Michigan, June 23 1948 Philadelphia. American Society for Testing Materials, 1949 103 p. illus. 23 cm (Special technical publication no. 84) $1 00. 5855

Contents: Introduction, by R. C. Adams. Development of functional grease test methods for the aircraft industry by D. H. Moreton. Summary of machines for bearings, by D. F. Wilcock and E. Anderson. Laboratory performance tests for antifriction bearing greases, by M. Kelso and others. Service experience with greases, by E. T. Lessel and C. L. Pope. Factors affecting simulated service tests of greases, by S. M. Collegeman and J. R. Batt. General discussion.

Note: The papers in this symposium are written for manufacturers and users of antifriction bearing greases. Prepared by authors who represent both points of view, they describe the methods and apparatus used for evaluating and selecting lubricating greases. Discussions of the results and conclusions derived from each type of test are included.

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on methods of measuring viscosity at high rates of shear Presented to the API Committee on Petroleum Products, Chicago, Ill., November 7 1949 and to Research Division VII on Flow Properties ASTM Committee D-2 on Petroleum Products and Lubricants, Washington, D C February 24 1950. Philadelphia American Society for Testing Materials, 1951 47 p. illus. 22 cm. (Special technical publication no. 111) $1.35 5856

Contents: Introduction, by J. C. Geniesse. Viscosity-shear behavior of two non-Newtonian polymer-blended oils, by M. R. Fenske and others. The Kingsbury tapered-plug viscometer for determining viscosity variations with temperature and rate of shear, by S. J. Needs. The comparison of viscosity-shear data obtained with the Kingsbury tapered plug viscometer and the PRL high shear capillary viscometer.

Note: These papers report on studies of studies which were made to determine the viscosity of special oils and lubricants under various rates of shear. Resulting data are tabulated, and the techniques and equipment employed in the tests are described in detail. Of particular interest to lubrication experts and mechanical engineers.

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on synthetic lubricants. Fiftieth annual meeting, American Society for Testing Materials, Atlantic City June 16–20 1947 Philadelphia American Society for Testing Materials, 1947 33 p. illus. 23 cm. (Special technical publication no. 77) $0.50 5857

Contents: "Ucon" synthetic lubricants and hydraulic fluids, by J. M. Russ, Jr. Synthetic lubricants from diesters, by F. J. Glavis and H. R. Stringer Synthetic lubricants for military aircraft, by C. C. Singleterry

Note: The present papers, written by experts in synthetic lubricant manufacture, critically discuss the composition, properties, and uses of a number of modern organic lubricants which are not of petroleum origin. Brief reference lists are provided.

BASTIAN EARL L. H.

Metalworking lubricants their selection application and maintenance. New York Mc Graw Hill Book Company Inc., 1951 357 p. illus. 24 cm. $6 00 5858

Contents: An introduction to metalworking lubricants. Types of metalworking lubricants. Cutting fluids. Drawing fluids and compounds. Extrusion and extrusion lubricants. Mold coatings. Forging and forging lubricants. Rolling oils. Metal-coating processes. Heat-treating—quenching and tempering mediums. Machine-tool lubrication. Lubrication of press, drawbench, and forge equipment. Application of lubricants. Lubricant quality control. Lubricant test methods and specifications. Appendixes. Index.

Note: This book covers not only cutting oils but all varieties of lubricants used in metal working, as well as some material on the lubricants in the working of such nonmetallic materials as plastics. The treatment is practical, and the book is suitable for such uses as engineers in charge of metalworking processes. Compact discussions of the processes are included, along with discussions of appropriate lubricants. The text is generously illustrated, selected references are appended to the chapters, and there are numerous tables of engineering data.

BONDI ARNOLD AARON

Physical chemistry of lubricating oils. New York Reinhold Publishing Corporation 1951 380 p. 24 cm. $12 00. 5859

Contents: Pressure-volume-temperature (P-V-T) properties. Rheology. Surface phenomena. Optical and electrical properties. The hydrocarbon type analysis of lubricating oils. Phase equilibria. Reaction kinetics. Synthetic lubricants. Index.

Note: An authoritative survey of the general status of the physical chemistry of the hydrocarbons used chiefly for lubrication. The main emphasis is on the relation between chemical structure and physical properties and on the means for measuring these properties. There is also some discussion of the chemical reactions of lubricating oils and greases with such substances as oxygen and sulfuric acid, since these reactions affect the properties that are important in lubrication. The text is supplemented by much tabulated data, and each chapter is accompanied by a fairly extensive bibliography that includes patents as well as books and articles. The author is associated with the Shell Development Company

BONER, C J

Manufacture and application of lubricating greases. New York Reinhold Publishing Corporation, 1954 977 p illus. 24 cm. $18.50 5860

Contents: Introduction. Structure and theory. Additives other than structure modifiers. Raw materials. Manufacturing processes. Equipment for lubricating grease manufacture. Aluminum base lubricating greases. Barium base lubricating greases. Calcium base lubricating greases. Lithium base lubricating greases. Sodium base lubricating greases. Lead soap lubricating greases. Strontium base lubricating greases. Miscellaneous metal soaps as components of lubricating greases. Mixed base lubricating greases. Complex soap lubricating greases. Non-soap thickeners for lubricating fluids. Fillers in lubricating greases and solid lubricants. Residua and petrolatums as lubricants. Analysis of lubricating greases. Tests of lubricating greases and their significance. Application of lubricating greases. Trends in lubricating greases. Index.

Note: A comprehensive work based in large part on the literature published since 1937. It covers structure, raw materials, manufacturing processes and equipment, the various classes of lubricating greases based on the thickening agents now used, analyses and testing, methods of applying greases to machines, and a view of probable future developments. Most of the space is devoted to aspects of the field which are primarily of interest to manufacturers of lubricating greases. The group of 11 chapters which begins with the chapter on raw materials accounts for 471 of the book's pages. However these chapters do contain some information potentially useful to engi-

Contents General data. Nomenclature and specifications. Design elements. Design calculations. Interleaf friction. Materials. Flat springs.

—— Manual on design and manufacture of torsion bar springs. New York Society of Automotive Engineers, Inc., 1947 30 p illus. 28 cm $4 00 5847

Contents Introduction. Design calculations. Design of end fastening. Processing.

—— Manual on design and manufacture of volute springs. New York Society of Automotive Engineers, Inc., 1945 25 p illus. 28 cm $3 00 5848

Contents Introduction. Manufacture. Design. Supplement.

Note. Each of the above manuals presents basic data and formulas which are of value to engineers and machinists concerned with the design, construction, and uses of various types of springs.

SPOTTS, M F

Design of machine elements. Second edition Englewood Cliffs, N J Prentice-Hall, Inc., 1953 504 p illus. 23 cm. $8 00 5849

Contents Fundamental principles. Working stresses. Shafting. Springs. Screws. Belts, clutches, brakes. Welded and riveted connections. Lubrication. Ball and roller bearings. Spur gears. Bevel, worm and helical gears. Miscellaneous machine elements. Dimensioning and details. Engineering materials. Index.

Note. A successful text designed primarily for use by advanced undergraduate college students of mechanical engineering. It is introductory to the subject of machine design. However the treatment is mature enough to make the book useful to graduate engineers who are not specialists in machine design but occasionally need information on some problem in it. Emphasis is placed on the fundamental principles pertaining to the design of separate machine elements rather than on complete machines. Useful data regarding stress factors, coefficients of friction, and standard dimensions, etc., are tabulated throughout the book. Many illustrative examples of problems in design with their solutions are included in the expository text and review problems for students are included also. The first edition was published in 1948. In the second edition, the length of the book has been increased by 100 pages. Changes included the rewriting of several chapters and the revision and augmentation of sections of others. Again, fairly extensive bibliographies are included.

STEWART, HARRY L

Hydraulic and pneumatic power for production, how air and oil equipment can be applied to the manual and automatic operation of production machinery of all types with numerous existing installations explained in step-by step circuit analysis By Harry L. Stewart, assisted by Floyd D Jefferis. New York Industrial Press 1955 406 p illus 24 cm $8 50 5850

Contents The evolution of fluid power Hydraulic fluids. The hydraulic power unit. Hydraulic accumulators. Fluid power lines. Hydraulic valves and their functions. Hydraulic cylinders, intensifiers, and motors. Heat exchangers for hydraulic systems. Synchronizing the movement of fluid power rams. Dual pressure hydraulic systems. Safety controls for hydraulic circuits. Sequencing of hydraulic cylinder motion. Packings and seals. Air filters, lubricators, and regulators. Pneumatic controls. Air cylinders and their design. Power-operated holding devices. Pneumatic safety circuits. Remote control pneumatic systems. Combination of fluids in single system. Index.

Note A practical book addressed to engineers and high-level technicians who are concerned with the application, selection and/or maintenance of fluid power transmission systems. Both air and oil systems are covered, but the latter type is given most of the space because of its greater adaptability The principles of systems and the principles and mechanical details of system elements are well explained. A wide variety of applications is illustrated. Specialized maintenance operations, such as the replacements of packings, are described explicitly

TAYLOR, FRANK A.

Catalog of the mechanical collections of the Division of Engineering, United States National Museum. Washington D C. The Smithsonian Institution, 1939 203 p. illus. 23 cm. (Smithsonian Institution. United States National Museum Bulletin no. 173) Gratis. 5851

Contents Introduction. Mechanical elements. Animal power. Power from the wind. Water power. The steam engine. Rotary steam engines. Steam-engine valves and valve gears. Inventions of George H. Corliss. Engine governors. Condensers. Engine indicators. Miscellaneous steam-engine accessories. Air and hydraulic engines. Mechanical transmission of power Steam boilers, accessories and burners. Boiler feed-water pumps and injectors. Steam pumps. Fire engines. Miscellaneous pumps. Internal-combustion engines. Carburetors. Internal-combustion engine accessories. Caloric or hot-air engines. Air-and-steam ("aerator") engines. Refrigerating machines. Selected bibliography Index.

Note A descriptive catalogue of the mechanical devices and inventions, roughly designated as prime movers with their accessories and auxiliaries, which are in the collections of the United States National Museum. Each object is briefly described. Patent Office models include date of submission and application of patent, purpose of the design, actual functioning, and, in some instances, a short historical note on the later commercial development of the device. Many of the objects are illustrated in photographs, and there are 74 bibliographic entries.

VALLANCE, ALEX., AND VENTON LEVY DOUGHTIE

Design of machine members. Third edition. New York McGraw Hill Book Company, Inc., 1951 500 p 24 cm $7 75 5852

Contents. Introduction. Engineering materials. Stresses in elementary machine members. Design stresses and factor of safety Cylinders, pipes, and tubes. Metal fits and tolerances. Flat plates and cylinder heads. Riveted joints. Welded joints. Threaded fasteners and power screws. Keys, cotters, and knuckle joints. Shafts. Sliding bearings. Roller and ball bearings. Couplings and clutches. Brakes. Springs. Spur gears. Bevel and screw gears. Belts and belt conveyors. Rope drives. Hoisting and power chains. Miscellaneous machine members. Index.

Note. A standard engineering college textbook. The discussions of some topics are full enough to make it useful also to men out of college who are not professional machine designers but who must occasionally design a machine part. The present edition is 59 pages shorter than the preceding edition. This change has been accomplished chiefly by resetting the type so that the typical page contains more matter New material has been added on such topics as stresses, riveted joints, threaded fasteners, and gears.

WINSTON, STANTON EDWIN

Machine design. A text presenting those fundamentals of theory and analysis which are basic to the field of machine design. Chicago American Technical Society, 1939 333 p. illus. 21 cm $3 95 5853

Contents Simple and compound stresses. Bolts and screws. Cylinders and riveted joints. Shafting and keys. Couplings and clutches. Wrapping connectors and their pulleys, sheaves or sprockets. Friction drives and spur and bevel gears. Miscellaneous details of design. Index.

Note Fundamentals of theory and analysis basic to the field of machine design are treated in this text for beginners. The calculus is not resorted to, as several rational formulas are included for which no derivations are given. Practical examples are furnished with detailed solutions.

WINSTON, STANTON EDWIN

Mechanism fundamental theory of the modification and transmission of motion. Chicago American Technical Society 1941 372 p. illus. 21 cm $4 25 5854

Contents. Mechanism. Machines. Frame. Constrained motion. Turning and Links. Driver and follower Higher and lower pairing.

[illegible] of symbols, etc., but also the visualization of the object represented by the drawing on the blueprint. It is fully illustrated, and the illustrations include some reproductions of blueprints [illegible] their usual color and size. The first edition was published [illegible] 1941 and the second in 1944. The new step-by-step method helps the student to visualize from [illegible] blueprint is one of the features of this third edition.

INTERNATIONAL BUSINESS MACHINES CORPORATION

Blueprint reading. Prepared by the Department of Education, International Business Machines Corporation. Syracuse Syracuse University Press, 1946. 81 p. illus. 29 cm. $4.75. 5867

Contents: Making the blueprint. Learning the language of blueprint reading. Visualizing the object. Using fractions and decimals. Engraving [illegible]. Blueprint reading procedure. Sectioning. Lines, arcs and circles. Using standards. Practicing blueprint reading. Reading assembly blueprints. Abbreviations. Table of decimal equivalents.

Note: A textbook specifically designed for the instruction of [illegible] and others whose work involves the reading of blueprints. In other words, its purpose is the instruction of technicians and [illegible] rather than engineers. The volume is thoroughly illustrated, and the illustration section includes numerous reproductions of actual blueprints. Accompanying the blueprints in some [illegible] is [illegible] reproduction of [illegible] photograph of the actual article [illegible] on the blueprint. The book was developed and tested [illegible] the training program of the International Business Machines Corporation.

SPENCER, HENRY CECIL, AND HIRAM E. GRANT

The blueprint language of the machine industries. New York The Macmillan Company 1947 255 p. illus. 29 cm. $5.50 5868

Contents: [illegible] prints. Views of objects. Normal surfaces and edges. Inclined and oblique surfaces and edges. Cylindrical surfaces and edges. Sectional views. Auxiliary views. Screw threads and fasteners. Dimensioning. Shop processes. Reading micrometer calipers and height gages. Fine-angle drawings. Right-hand and left-hand drawings. Welding representation. Gears. Commercial blueprints. Appendix. Index.

Note: The primary purpose of this book is to provide basic training in blueprint reading for industrial operators of machine tools. The volume [illegible] directly [illegible] practical use, containing [illegible] of [illegible] and [illegible] of text, with emphasis on development of the student's ability to visualize objects in three dimensions. The book is [illegible] loose-leaf form and is suitable for both self-instruction and class-instruction purposes. Review problems are attached to each chapter.

UNITED STATES. DEPARTMENT OF THE NAVY BUREAU OF NAVAL PERSONNEL

Blueprint reading and sketching. Washington, D. C. Government Printing Office, 1956 275 p. illus. 20 cm. (Navy training courses. Navpers 10077 A) $1.00. 5869

Contents: Making and handling blueprints. Blueprint views. Lines and sections. Dimensions. Title blocks, numbers, and bills of material. Technical sketching. Curve or bend allowance. Templates. Electrical and electronic blueprints. Mechanical and piping symbols. Welding symbols. Architectural and structural drawings. Appendix. [illegible] to [illegible]. Standard abbreviations. Fractions and decimal equivalents. Index.

Note: One of [illegible] series of basic Navy training courses, this book is designed for the instruction of enlisted men whose duties require knowledge of blueprint reading and sketching. Beginning with [illegible] general discussion of the uses and kinds of blueprints, the text explains the terms used in blueprinting. Technical sketching is described and illustrated, and ways are suggested for the production of correct and effective sketches. The sections on wiring and schematic diagrams are extensive, in order to meet current demands in electric and electronic equipment engineering.

WEIR JOHN J

Blueprint reading for the machine trades. New York McGraw Hill Book Company Inc. 1941 82 p. illus. 28 cm. $3 96 5870

Contents: Blueprint reading. More complicated objects. Cylinders, curves, and combinations. Measurements. Dimensions. Titles and notes. Sections. Threads. Detail and assembly prints. Machine operations and finishes. Screws, rivets, keys, keyways, and pins. Fits, limits, tolerances, and allowances. Auxiliary views. Gears and gearing. Reading commercial prints.

Note: An elementary text offering [illegible] complete course in blueprint reading as applied to the machine trades. Gives step-by-step instruction in principles and methods and practical problems of the type constantly encountered in shop and industry

TOOLS

AMERICAN SOCIETY OF TOOL ENGINEERS

Tool engineers handbook a reference book on all phases of planning control design tooling and operations in the mechanical manufacturing industries. Frank W Wilson, editor in-chief. New York McGraw Hill Book Company Inc. 1949 2 070 p. illus. 23 cm. $15.00 5871

Contents (abridged): Tool engineering economics. Production analysis and cost estimating. Job planning and control. Quality planning and control. Time study and rate setting. Plant layout. Identifying codes and numbering systems. Drafting-room standards and practices. General structure and properties of metals. Heat-treating and hardening. Principles of metal cutting and machinability. Properties and workability of woods. Properties and workability of plastics. Sand casting. Metal mold casting. Plaster casting. Investment casting. Powder metallurgy. Extrusion of metals. Single-spindle automatic lathes. Single-spindle automatic screw machines. Multiple-spindle automatic bar and chucking machines. Vertical boring mills and turret lathes. Planing, shaping and slotting. Gear milling and hobbing. Thread grinding. Hobbing. Power broaching. Circular-saw friction cutting. Grinding. Superfinishing. Press-brake bending. Metal spinning. Rotary swaging. Drop, machine, and press forging. Press-working of metals. Oxygen (flame) cutting. Resistance welding. Assembly methods for bolts, screws, and rivets. Wire stripping and stitching. Gluing. High-frequency dielectric heating. Plastic joining of materials. Shot peening. Static and dynamic balancing. Allowances and tolerances for cylindrical fits. Inspection equipment and methods. Non-destructive testing and inspection. Master tooling. Limited production tooling. Hydraulic equipment. Pneumatic equipment. Electronic drives and controls. Ball and roller bearings. Springs. Mathematics. Reference tables. Index.

Note: An encyclopedic compendium of information useful in tool engineering. Because tool engineering touches upon most of the processes employed in the forming of metals and other materials, the book is also virtually an encyclopedia of machine shop techniques. There are 113 sections, each one the work of an outstanding authority. The sections are signed and, furthermore, the names of the specialists who reviewed each section is given. The book is generously illustrated. There is an exceptionally detailed index. Various parts of the book have been issued separately by the same publisher.

AMERICAN SOCIETY OF TOOL ENGINEERS ASTE NATIONAL BOOK COMMITTEE

Die design handbook a practical reference book on process analysis product design, metal movements, materials and proved die designs for every class of sheet metal press-working. Francis J Sehn, chairman. New York McGraw Hill Book Company Inc., 1955 732 p. illus. 24 cm. $14.50 5872

Contents: Pressworking terminology. Stampings design. Process planning for presswork tooling. Shear action in metal cutting. Cutting dies. Bending of metals. Bending dies. Metal movement in forming. Forming dies. Displacement of metal in drawing. Draw dies. Dies for large and irregular-shaped stampings. Rubber-pad and hydraulic-action dies. Compound dies. Progressive dies. Com-

neers, purchasing agents, and technicians who are interested in lubricating greases from the standpoint of use, and the terminal chapters on analysis testing and application are primarily for users. Extensive bibliographies to which important textual statements are keyed are a valuable feature.

BREWER, ALLEN F

Basic lubrication practice. New York Reinhold Publishing Corporation, 1955 286 p illus. 24 cm. $7 50 5861

Contents. The operating conditions affecting lubrication. Physical tests of petroleum lubricants and their significance. Plain or sleeve-type bearings and cams. Bearing materials. Ball and roller bearings. Thrust bearings. Gears. Chains. Wire rope lubrication Flexible couplings. Methods of sealing. Automatic lubrication. Rust preventive lubricants. Steam turbine service. Steam cylinder lubrication. Internal combustion engine oils. Power plant auxiliaries. The electric motor. Air compressors and pneumatic tools. Refrigeration compressor lubrication. Hydraulic power Careful storage and handling prevents contamination. Lubricating oil reconditioning. Nonpetroleum lubricants. Subject index.

Note In this book, the lubrication of machinery used in industry is treated from the viewpoint of plant engineers and supervising operating personnel. Theory is not covered, but the book is more than a manual of practice. Reasons behind practices are explored at some length, as for instance in the 18 pages on how gears wear Considerable information on the testing of lubricants, on their care in handling and storage and on their reconditioning is included. The reference lists include not only regularly published books and articles but also selections of manufacturers literature.

FORBES, WILLIAM GORDON

Lubrication of industrial and marine machinery Second edition Revised by C L Pope and W T Everitt. New York John Wiley & Sons, 1954 351 p illus. 24 cm $7 00 5862

Contents Chemistry of petroleum. Distillation. Distillation of lubricating oils. Refining light distillates and lubricating oils. Fatty oils. Blending. Solid lubricants. Additives for lubricants. Physical tests. Functional tests. Greases. Synthetic lubricants. Specifications. Bearing lubrication and the formation of oil films. Ball and roller bearings. Methods for applying lubricants. Oil purification and reclaiming. Machine storage and shipment. Steam engines. Steam turbines. Hydraulic turbines. Hydraulic systems and fluid couplings. Air compressors and vacuum pumps. Pneumatic tools. Refrigerating machines. Reduction gears. Internal-combustion engines. Gasoline engines. Internal-combustion engine lubricating oil. Heat treating oils. Cutting oils. Lubrication of equipment. Lubrication engineering. Appendix. Index.

Note. A standard text designed to aid mechanical engineers and other technicians in understanding lubrication and in selecting and testing lubricants. The initial chapters describe the methods of preparation and characteristics of oils and greases, and their behavior under various operating conditions. Part two discusses the application of these lubricants to meet the needs of specific types of machines. In this second edition the original material has been revised and rearranged to incorporate recent developments in the field. New chapters on fatty oils and solid lubricants have been added, and such topics as additives and cutting oils are discussed at greater length

FULLER DUDLEY D

Theory and practice of lubrication for engineers. New York John Wiley & Sons Inc 1956 432 p illus. 24 cm $10 50 5863

Contents Fundamentals of viscosity and flow Viscosity and its variables. Hydrostatic lubrication. Hydrostatic squeeze films. Hydrodynamic lubrication. Hydrodynamic lubrication of journal bearings. Friction and power losses in journal bearings. Some typical industrial bearings. Air-lubricated bearings. Dry friction. Boundary friction. Bearing materials. Index

Note Although it has strong practical bias, the presentation of theory is an important feature of this new text on lubrication The equation for flow of a viscous liquid through wide rectangular slot is derived in the first chapter and is used repeatedly throughout the rest of the book. The reader is shown how to apply the concepts and methods of hydrodynamic analysis to lubrication problems. Applications of the basic ideas and equations to such problems as the analysis of friction and power losses in bearings is illustrated specifically with a number of worked examples supplementing the discussions. Considerable space is given to such practical matters as the deformation of bearing shells under conditions of machine operation. Several types of bearings important in industrial machines are analyzed, but the author does not attempt to cover all types. For example, there is little discussion of ballbearings. Extensive bibliographies are feature. The author is Professor of Mechanical Engineering in Columbia University and the book is designed for use as text for advanced engineering students. It is potentially of interest also to graduate engineers.

HOBSON, PAUL D

Industrial lubrication practice. New York Industrial Press, 1955 555 p. illus. 24 cm. $8 00 5864

Contents: Principles of lubrication. Running in new bearings. Types of lubricants and their use. Physical and chemical characteristics of lubricants. Methods of lubricant supply Plain bearings. Anti-friction bearings. Organization of lubrication department. Storage and handling of lubricants. The purification and reclamation of oil. Hydraulic systems and equipment. Electric motors and generators. Two-stroke gasoline engines. Four-stroke gasoline engines. Diesel engines. Compressors. Refrigeration equipment. Pneumatic tools. Reciprocating steam engines. Steam turbines. Metal forming machines. Metal cutting machines. Cutting fluids. Gears for power transmission. Chains, ropes, belts, and couplings. Storage preservation of machinery Appendix. Glossary Index.

Note. A practical rather than theoretical treatment, this book is potentially of interest to engineers in many fields of machine design, operation and maintenance. It describes in simple terms the lubrication requirement and problems of the kinds of bearings used in industrial machinery and particular classes of machines. There is also much related material of interest in machine design. The chapter of anti-friction bearings—to take an example—contains discussions of not only the lubrication of ball roller and needle bearings but also describes their mounting, enclosures and seals. A number of diagrams showing the principles of such things as labyrinth enclosures to retain lubricants are included. Chapters on cutting fluids and on the storage of machinery—which also involve the use of oils and greases—are included, even though in such applications the oils and greases are not used primarily as lubricants. There is a detailed index but there are no references to other literature.

SLAYMAKER, R. R.

Bearing lubrication analysis. New York John Wiley & Sons, Inc., 1955 108 p. illus. 24 cm. $5 00 5865

Contents Introduction. Viscosity and other properties of oil. Hydrodynamic journal bearings—load-carrying capacity Friction torque. Oil flow and temperature rise. Examples of sleeve bearing design. Bearing materials, construction and life. Boundary conditions, the coefficient of friction, and oilless bearings. Index.

Note. An introductory work addressed primarily to engineering college students who are preparing for work in machine design. It is limited to sleeve bearings that is to say such types as ball and roller bearings are not considered. There are two chapters on hydrodynamic journal bearings subdivided as indicated above. These are the analytical core of the book, and they are supplemented by concrete examples of bearing design, discussion of bearing materials and a final chapter on the special case of oilless bearings.

BLUEPRINT READING

IHNE, RUSSEL W, AND WALTER E. STREETER

Machine trades blueprint reading Third edition. Chicago American Technical Society 1956 172 p. illus. 28 cm. $3 50 5866

Contents. Blueprints—from design to product. From blueprint to visualization. Understanding the various lines. Reading the working drawing. Understanding supplementary information. Using special views and assembly drawings. Reading industrial blueprints. Appendix. Glossary of common machine trade terms. List of common abbreviations. Decimal equivalent chart. Problems in shop arithmetic.

Note A standard, elementary text used in vocational and trade schools for the instruction of young men who are preparing to become machinists. It teaches not only the reading of dimensions,

Beary portions. Principles of dimensioning. Determination of the sequences and conditions of process. Determining the ... of ... process. Determining the sequence of operations of process. Principles of locating. Tool design. Clamping principles. ... analysis. Index.

Note: One of the essential preliminary steps in the manufacture of any metal product is "tooling up." If the article is to be manufactured economically in commercial quantities, not only must it be designed that it can be produced without waste of material and labor, but special tools—such things as fixtures, jigs and dies—must be designed and made so as to render rapid and accurate manufacturing possible. This book provides an over-all introductory view of the problems and methods of these operations. There is no attempt to show how the special tools are made by the tool maker. The book will be useful to students preparing for tool engineering, ... and tool engineers, and machinists who wish to gain ... into tool engineering. It is suitable either for classroom or home study.

GILL, JAMES PRESLEY AND OTHERS

Tool steels, by J P Gill, R. S. Rose G A. Roberts, H. G. Johnstin and R. B George. Cleveland. American Society for Metals, 1944. 577 p. illus. 23 cm. $7.50. 5880

Contents (abridged): Manufacture of tool steel. Classification of tool steels. Testing of tool steels. General properties and selection of tool steels. General principles of heat treatment of tool steels. Purpose and effect of alloying elements on tool steels. Carbon, chromium and silicon tool steels. Tungsten finishing steels. Chromium die steels for cold work. Die steels for hot work. High speed steels.

Note: Intended for the users of tool steels rather than the metallurgist, the work offers theoretical and practical information concerning the more commonly manufactured tool steels. There is an extensive bibliography and an index.

GIESES GERHARD J

Tool engineers data book. New York Reinhold Publishing Corporation, 1953 219 p. illus. 24 cm. $6.50. 5881

Contents: Standard specifications. Physical constants of metals and alloys. Chemical properties of metals and alloys. Mechanical properties of metals and alloys. General properties of special alloys. General properties of plastics. Weights of metals and alloys. Heat treatment of metals and alloys. Rapid identification of metals and alloys—of plastics. Working properties of metals and alloys. Operational tables. Standard formulas. Conversion tables. Mathematical tables. Definitions of metallurgical terms. Index.

Note: A handy compilation of specifications, formulas, constants and other technical data required by machinists and tool designers. The information relates primarily to the properties and utilization of metals and plastics, but selected mathematical tables and conversion factors are included. Since the book is designed for use as a quick reference tool, theoretical discussions and explanatory paragraphs are lacking almost entirely. The exceptions to this policy occur in the cases of definitions and of methods for identifying metals and plastics.

GWIAZDOWSKI, ALEXANDER PETER

Tool engineering. Appleton, Wis. C C Nelson Publishing Company 1951 306 p. illus. 24 cm. $6.00. 5882

Contents: The engineer—creator of abundance. Industrial organization. Limits, tolerances, and allowances. Measuring and gaging. Precision used in tool design. Grinding and lapping process. Milling process and fixtures. Work-holding fixtures. General rules for the design of jigs and fixtures. The broaching process. The drilling process. The reaming and tapping processes. The extrusion of metals. The stamping process. Cost calculations and shop drawings of gears. Cutting tools. High-speed and commercial tool steels. Heat treatment of ferrous alloys. Jigs and fixtures made by welding process. Jig boring and ... methods. Review questions and suggestions. References for further reading. Names and addresses of manufacturers who supplied illustrations. Index.

Note: An introductory textbook for engineering students, especially students who are preparing for careers in the manufacturing of interchangeable parts. The design of tools for the manufacture of particular parts—a connecting rod cap for an internal combustion engine—is used as ... thread on which to string the exposition. However, the student is introduced to ... wide range of topics which are of concern to the tool engineer. Many illustrations of modern machine tools are included. The author, now deceased, is Professor of Industrial Engineering in Tri-State College.

HINE CHARLES R.

Machine tools for engineers. New York McGraw Hill Book Company Inc., 1950 355 p. illus. 23 cm. $6 00 5883

Contents: The engineer and the machine tool. Cutting tools. Measurement. The lathe. Threads and threading. Hole making and the drill press. The shaper. The planer. The milling machine. Broaching. Abrasives and grinding. Microfinishing. Boring machines. Gear making. Jig boring. Sawing. Turret lathes. Appendix. Index.

Note. An introductory work designed primarily for students of engineering. It describes the major machine tools, their principles of operations, uses, and limitations. Certain operations and processes such as measuring and superfinishing are described in conjunction with the discussion of the instruments or the machines used in the operations. Numerous reproductions of photographs of present day machine tools are included. The material is presented from the engineer's rather than the machine tool operator's viewpoint.

HINMAN CHAUNCEY WEED

Die engineering layouts and formulas, a reference book illustrating and describing the key designs of punches and dies based on precept and formulas. New York McGraw Hill Book Company Inc., 1943 497 p. illus. 23 cm. $7 50 5884

Contents. Sheet metal economy in the pressroom. Types of blanking dies. Progressive dies. Bending and forming dies. "Cut-and-carry" progressive dies. Laying out dies in consecutive order. Perforating and piercing. Methods of feeding. Drawing shells. Calculating shell blank sizes. Fabricating aircraft parts. Hydrostatic dies. Forging, coining, swaging, extruding. Welding. Miscellaneous pressroom equipment and materials. Tables and charts.

Note. A practical guide and reference for the tool engineer explaining the basic mechanical principle of assembled die designs and describing clearly their attendant operating details. The book includes all the necessary mathematical formulas for laying out the assembled dies in clearly rendered drafting technique. Nearly 400 drawings and photographs are shown representing about 90 per cent of the key designs used in tools for presswork.

HINMAN CHAUNCEY WEED

Practical designs for drilling, milling and tapping tools an illustrated reference book for designing drafting and using modern types of drilling milling and tapping tools. Second edition. New York McGraw Hill Book Company Inc., 1946 416 p. illus. 23 cm. $7.50. 5885

Contents: Drafting and designing. Fundamental types of drill jigs. Typical drill jigs and accessories. Work clamps and supports for drilling or milling. Centralization and equalization of work. Locking work with cams and keys. Commercial jigs and fixtures. Special vise jaws for milling. Clamps and supports for milling. Milling fixtures. Fixtures and methods for tapping. T bit drills and milling cutters. Special and standard machine operations. Shop mathematics. Speeds, feeds, lubricants, and coolants. Tool engineering tables. Correlated list of visual aids. Index.

Note: A useful book for practical tool designers and also for operators of machine tools. The second edition is greatly improved over the first edition (1938). The amount of textual material has been more than doubled, and many new illustrations have been added. A number of the photographs show details of recently developed American tools.

JEFFRIES WILLIAM R.

Tool design. New York Prentice-Hall, Inc., 1955 217 p. illus. 22 cm. $4 00 5886

Contents. Introduction. Drill jigs. Mill fixtures. Lathe fixtures. Weld fixtures. Tool masters. Sheet metal presswork. Cutting tools. Locating—clamping. Design of product for economical production.

pound and combination dies. Miscellaneous dies. Die sets and maintenance. Pressworking lubricants. Safety in pressworking. Press data. Ferrous die materials. Nonferrous and nonmetallic die materials. Ferrous stamping materials. Nonferrous stamping materials. Index.

Note. A well-sponsored reference book intended for everyday use by experienced die-makers. Essentially it is a handbook of successful die designs. Dies are considered from the viewpoint of type or purpose. Most of the sections devoted to a type of die are further subdivided so that related sub-types or species are all discussed within the space of a few pages. For example the section on cutting dies is subdivided under such subheads as "Piercing and perforating dies," "Horn-type cutting dies," "Blanking dies," "Dinking dies," "Trim dies," etc. The discussion of each species of die is compact, and in many instances more space is given to reproductions of drawings of proved dies than to textual descriptions. The sections on die types are supplemented by sections on general considerations, such as terminology, metal movement, lubricants and safety. The sections include selected list of references and there is a good general index.

BAKER, WARREN, AND JOSEPH S KOZACKA

Carbide cutting tools, how to make and use them. Chicago American Technical Society 1949 416 p illus 22 cm $6 00 5873

Contents: Machine tools and the carbides. Converting to carbides. Tool angles, machinability. Tipping a carbide tool. Grinding single-point tools. Cutting power speeds, feeds. Carbide tool design. Coolants and carbide tools. Carbide forming tools. Carbide milling cutters. Sharpening milling cutters. Multiple-edge carbide tools. Cutting speeds, feeds, forces. Multiple-edge tool design. Selection of a carbide. Tool materials, assembly. Grinding and use of tools. Index.

Note An impressive compendium of information on carbide cutting tools. It was written for use as text in vocational schools, and as self instruction book by practicing machinists and tool designers. It provides an inclusive treatment of the subject from the practical viewpoint. The educational value of the text is increased by very liberal number of illustrations, which show tools and machining operations, and by numerous tables of reference data. Review questions and helpful lists of references are appended to the chapters.

BENSON, ELMER B

Elementary tool design Peoria Chas. A Bennett Company, Inc , 1954 224 p. illus 26 cm $4 76 5874

Contents. Introduction. Shop practice. Related subjects. Specifying material and its treatment. Tool design interpretation. Tool design details. The tool assembly drawing. Clamping. The drill jig. The fixture. Continuous milling. Fixed gages. Cutting die classification. Cutting die design. Forming die classification. Forming die design. Multiple operation dies. Associated subjects. Appendix. Index

Note An introductory text for students who have completed courses in mechanical drawing and general machine shop practice. It is written at the vocational-school level and from the viewpoint of students who will be practically concerned with the design of such tools as jigs, fixtures, and dies. The practical fundamentals of the field are covered, but it is obvious that the author expects his readers to turn to other books for much essential information. A "List of references for further study" is included in each chapter The book is generously illustrated.

BRYANT, LELAND ADAM, AND T A DICKINSON

Jigs and fixtures for mass production. New York Pitman Publishing Corporation, 1947 222 p illus 23 cm $4 20 5875

Contents The need for jigs and fixtures. Tooling procedures. Designing jigs and fixtures. Types of jigs and fixtures. Master tools. Master tooling dock. Construction of jigs and fixtures. Pneumatic and hydraulic mechanisms. Plastics. Miscellaneous jigs and fixtures. Glossary Appendix. Index.

Note A reference work for production engineers and machinists. In addition to describing typical jigs and fixtures and their uses, the authors trace the history of these devices and indicate their importance to industry as a whole as well as to the individual shop The appendix tabulates useful shop data such as wire gage dimensions, drill sizes, etc.

COLE, CHARLES BRADFORD

Tool design fundamental principles of design as applied to tooling for production. Chicago American Technical Society, 1941 498 p. illus. 21 cm. $5 00 5876

Contents Practice and procedure. Materials. Jig, fixture and tool design standards. Commercial standards. Cutting tools. Tooling for production. Drill jigs. Fixtures. Dies. Gages. Appendix. Common abbreviations for the tool designer symbols for welds, American and National screw threads, terminology relating to threads, screw-thread fits. Index.

Note This text on tool making stresses design of fixtures and tools rather than the method of making them. The style is simple and direct. Questions at the end of chapters make the book valuable for home study or school work.

COLVIN, FRED HERBERT, AND LUCIAN L. HAAS

Jigs and fixtures a reference book showing many types of jigs and fixtures in actual use, and suggestions for various cases. Fifth edition New York McGraw Hill Book Company, Inc., 1948 410 p illus. 23 cm. $6.00. 5877

Contents. Introduction. Section I, Standardizing fixture design Designing jigs and fixtures. Advantages of tool-design standards. Details of fixture design. Welded, cast-iron, and light metal fixtures. Section II, Details in fixture design Locating schemes for drill jigs and fixtures. Machine vises and vise jaws. Clamps and clamping methods. Section III, Accuracy in drilled holes. Drilling jigs and fixtures. Drill-jig bushings. Types of drill jigs and fixtures. Pneumatic fixtures for holding work. Section IV Methods for production milling Milling fixtures. Grinding-machine fixtures. Section V Handling large subassemblies: Welding and assembling fixtures. Section VI, Inspection and toolroom systems: Fixtures for inspecting work. System in the toolroom. Index.

Note. In the manufacturing industries the efficient use of properly designed machine fixtures is an important factor in reducing the cost of producing an article. This volume, through the use of numerous practical illustrations, provides the tool design and construction, and offers suggestions and data on reducing the costs of new fixtures. In this edition the material has been rearranged, the wartime supplement of the fourth edition, dealing with welding and assembly fixtures, has been enlarged and incorporated as new chapters and new data regarding drill jig bushings and fixtures for large assemblies have been added.

DONALDSON, CYRIL, AND GEORGE H. LE CAIN

Tool design New York McGraw Hill Book Company Inc 1943 443 p. illus. 24 cm 5878

Contents Drafting room practice. Manufacturing processes as they affect the designer Properties of materials. Tolerances and allowances. Springs. Welding Cutting tools. Punch and die design. Gage and gage design. Elementary jigs and fixtures. Practical design of jigs and fixtures. Construction of Brown and Sharpe automatic screw machine. Tools used on Brown and Sharpe automatic screw machine. Cam design. Turret lathes. Index.

Note This is practical work for both students and experienced workers in the tool designing, tool engineering, tool making and drafting fields, intended to meet specific problems in industry Concise but practical units deal with manufacturing processes, materials, and welding. It is illustrated with 534 line drawings and halftones. A second edition was published in 1957 560 p., $6.75.

DOYLE LAWRENCE EDWARD

Tool engineering analysis and procedure. New York Prentice-Hall Inc., 1950. 499 p. illus 22 cm $9.35 5879

Contents The nature and scope of tool engineering. Principles of economics. Problems of economy Planning and tooling for economy Principles of estimating. Short cuts and variations in estimating. Manufacturing principles applicable [illegible] process and tool planning

WAGENER, ALBERT M., AND HARLAN R. ARTHUR

Hand tools. New York D Van Nostrand Company Inc., 1943 174 p. illus. 21 cm. $2.56 5893

Contents Rules and scales. Dividers and calipers. Combination squares and try squares. Miscellaneous small-precision tools. Precision gages. Specialized precision tools. Indicators. Lead screws, hammers, and marking tools. Turning and gripping tools. Tools for laying work at the bench. Miscellaneous holding aids. Tools of machinists. Hand-forming tools. Machine cutters and tool holders. Miscellaneous tools. Types of fasteners.

Note The volume covers in detail the many hand tools found in the machine shop of the large factory. The use of each tool is explained, with many photographs that show how it is held and manipulated. These illustrations and directions have been prepared to instruct the novice, but, at the same time, they are sufficiently detailed to serve the special needs of the experienced mechanic and home craftsman.

WALKER, JAMES, AND CARL C. TAYLOR

Simplified punch and diemaking. New York. The Macmillan Company 1946 235 p. illus. 22 cm. $5.00. 5894

Contents Introduction. Plain round blanking die. Typical blanking die. Emergency dies. Sectional blanking dies. Compound blank and pierce dies. Multiple blanking dies. Progressive dies. Punching and trimming dies. Bending and forming dies. Drawing dies. A manufacturing problem and its solution. Machine equipment. Summary. Reference. Index.

Note Dies for cutting sheet metal and dies for changing the shape of sheet metal by bending, forming, and drawing are covered in the book. Besides the descriptions of various die constructions and types, the reader is told about the layout and design, die materials and treatment, and the machine tools, including the Keller machine, such as used in die making. Many well-chosen photographs, showing all phases of diemaking, are included. The work is intended for both experienced and beginning machinists, tool and diemakers, industrial workers, and product designers.

MACHINE SHOP PRACTICE

AMERICAN SOCIETY FOR METALS

Machining—theory and practice. A series of thirteen educational lectures presented to members of the A.S.M. during the thirty-first National Metal Congress and Exposition, Cleveland. Cleveland American Society for Metals, 1950. 504 p. illus. 23 cm. $6.50 5895

Contents Metal cutting: art to science, by H. Ernst. Metal cutting research—theory and application, by M. E. Merchant. Cutting fluid theory, by M. C. Shaw. Materials and machinability by F. W. Boulger. Development of the microstructure of metals by machining, by L. M. Clarebrough and G. J. Ogilvie. Metallurgy and machinability of steels, by J. D. Armour. Tool steels, by G. A. Roberts. Cemented carbide tool materials, by J. C. Redmond. Heat in metal cutting, by A. O. Schmidt. Evaluation of machinability of steel, brass, bronze and cast irons, by M. Field and M. Zlatin. Tool life testing, by G. W. Boston. Some metallurgical aspects of grinding, by L. P. Tarasov. Economics of machining, by W. W. Gilbert.

Note The keynote of this volume is the application of the findings of research to practical metal-cutting techniques. The great advances which have been made in recent years in the understanding of what happens when metals are machined and how factors affect machinability are evaluated and interpreted for the benefit of engineers and metallurgists. The papers are addressed primarily to graduate students at work in metal-working industries. They are supplemented by illustrations and references to related literature.

AXELROD AARON

Machine shop mathematics. Second edition. New York. McGraw Hill Book Company Inc., 1951. 359 p. illus. 24 cm. $4.60. 5896

Contents Shop arithmetic. Measuring tools of the machine shop. Weights and measures. Practical instruments. Percentage and its applications. Ratio and proportion. Geometric constructions. Shop trigonometry. Speeds of pulleys and gears. Speeds and feeds. Lathe work. Gears. Milling-machine work. Appendix. Index.

Note A standard elementary text for use in vocational school courses and for home study purposes. Emphasis is placed on the practical applications of mathematical procedures at the high-school level. Numerous illustrative exercises and review problems constitute an important feature of the exposition. In this edition new chapters have been added on basic arithmetic operations, ratio and proportion, and percentage.

BURGHARDT HENRY D., AND AARON AXELROD

Machine tool operation. Part I, Safety measuring tools bench work, the drill press the lathe forge work. Fourth edition. New York McGraw Hill Book Company Inc., 1953 585 p. illus. 21 cm. $5.50 5897

Contents (abridged) The machinist's tools. Safety in the machine shop. Measuring tools of the machine shop. Bench work: Hammers, screw drivers, wrenches, hacksaws. Chipping, filing, scraping. Laying out. The drill press. The lathe: Lathe construction and manipulation. Cutting tools and cutting speeds. Centering. Facing. Chucking work. Threads and thread cutting. Faceplate work. Forge work. Annealing, brazing, and hardening. Hand forging in machine shop. Appendix. Index.

—— Part II The shaper the planer the milling machine the grinding machine, hydraulics, metal band saws metallurgy cutting fluids. With the assistance of James Anderson. Third edition. New York McGraw Hill Book Company Inc., 1954 677 p. illus. 21 cm. $5.00. 5898

Contents (abridged) Shaper construction. Shaper work. Planer construction. Planer work. The milling machine: Milling-machine construction. Milling cutters and their holding devices. Speeds, feed, and depth of cut. Typical milling setups and sample operations. The index head and indexing operations. Helical or spiral milling. Spur gears and bevel gears. The grinding machine: Grinding heads. Grinding practices and practice. Hydraulic power transmission. Metal-cutting band saws. Metallurgy. Cutting fluids. Appendix. Index.

Note An introductory fully illustrated text, which has been widely used in the training of young machinists since the appearance of the first edition in 1922. It is used primarily in organized classes, but is useful also in self-instruction. It is written in simple, practical style and contains approximately one illustration per page. The pictures show machine tools and typical operations on them. In comparison to preceding editions, the editions listed here represent extensive revision and augmentation in both text and illustrations.

COLVIN FRED HERBERT

New American machinist's dictionary the authoritative handbook of terms, definitions, and accepted standards of the machinists craft and industry New York. McGraw Hill Book Company 1956. 496 p. illus. 22 cm. $7.50 5899

Note Terms used in the literature on machine shop work are defined in this reference book. Most of the terms pertain directly to machine tools and to the operations performed on them, but few terms from related fields are included. An example of the latter is "gold leaf." Abbreviations are included in the main alphabet. Definitions are adequate and are expressed insofar as possible in the common language. Pertinent illustrations are numerous.

COLVIN FRED HERBERT AND FRANK A. STANLEY

Drilling and surfacing practice drilling, reaming tapping, planing shaping, slotting,

Appendixes Drafting practice. Standard drill bushings. Standard die sets. Standard parts. Decimal parts of an inch. Wire gauge standards. Hardness conversion tables. Index.

Note A thorough introduction to the principles of tool design is provided in this small book. The tools concerned are not the hand implements such as saw and hammer which the layman knows as "tools" or even machine tools such as the lathe. They are the endless variety of holding, positioning and shaping devices which tool designers in modern industry design for the mass production of special parts. Although the design of each such tool is a custom job related to a specific operation or operations on a particular part, a number of general principles and techniques having broad application have been evolved. These are the subject matter of this book. The classes or varieties of tools covered are named in the chapter titles. Surprisingly each class is covered in considerable detail, especially in regard to matters of some general applicability. The book is fully illustrated and contains literature references. It is intended primarily for use as a text. It is equally suitable for home study and reference by men who are beginners in tool design or who are preparing for this field on the basis of experience in machine shop work or drafting.

JONES, FRANKLIN DAY

Die design and diemaking practice. Third edition New York Industrial Press, 1951 1,083 p illus 24 cm $8 00 5887

Contents (abridged): Dies for cutting blanks from flat stock. Laying out blanking dies and general diemaking practice. Materials used in diemaking. Punch and die details. Sectional punch and die construction. Piercing and perforating dies. Sub-press or self-guiding dies. Bending and forming dies. Classes of drawing dies and general designing information. Dies for drawing shallow cups or shells. Dies for drawing deep shells. Drawing dies for conical or tapering forms. Drawing dies for spherical and oval shapes. Drawing square and rectangular shapes. The use of rubber in conjunction with press tools. Dies for special operations. Heat-treatment of die steels. Designing dies for powdered-metal parts. Index.

Note A practical and fairly comprehensive manual for beginners in diemaking and also for those who have had some experience in the craft. The third edition has been printed from the same type (or plates) as the second edition. Nevertheless, a considerable amount of new material has been added. Four new chapters, three at the end of the book and one at the end of the third chapter deal with diemaking materials, special pointers on the design of stampings, heat treatment of die steels, and dies for powdered-metal work. In addition, there are several insertions of additional pages in other chapters.

JONES, FRANKLIN DAY, editor

Jig and fixture design, a treatise covering the principles of jig and fixture design the important constructional details and many different types of work holding devices. Fourth edition New York The Industrial Press 1955 406 p illus. 23 cm. $5 00 5888

Contents Principles of jig design. Design of open drill jigs. Design of closed or box jigs. Jig bushings. Locating points and adjustable stops. Jig clamping devices. Examples of drill jig design. Boring jigs. Milling and planing fixtures. Adjustable fixtures for turret lathes and vertical boring mills. The floating principle as applied to fixture work. Application of the three-point principle in fixtures. Special jig and fixture mechanisms. Providing for upkeep in designing jigs and fixtures Arc welded jigs and fixtures. Jigs of the automatic type. Design of universal drill jigs. Plastic jigs and their application Special locating and clamping arrangements. Index.

Note The principles underlying the various kinds of jigs and work holding devices are expounded in this book and examples of numerous specific designs are described and illustrated. The third edition was published in 1941 The three chapters listed just before "Index" in the above table of contents are new in this edition.

OWEN, HALSEY F

Introduction to tool engineering New York Prentice-Hall Inc. 1948 149 p. illus. 24 cm. $3 00 5889

Contents. Introduction to tool engineering. Manufacturing methods and equipment. Methods and parts analysis. Operation sheets and bills of material. Designing for production. Manufacturing cost. Tooling programs and the economics of tooling. Tool design. Interchangeable manufacture. Estimating tool costs. Index.

Note. A brief survey of the responsibilities and techniques of tool, or production, engineers in American industry It deals with the selection of manufacturing methods and equipment, and with the planning of operation sequences in the production of specific articles. The necessity of taking into account in each case all relevant factors, such as available equipment, financial considerations and quality requirements, is emphasized. The operation of machine tools is not covered, but standard tools and special tools are both outlined from the viewpoint of the production engineer.

ST CLAIR, LEO J

Design and use of cutting tools. New York McGraw Hill Book Company, Inc., 1952 437 p. illus. 24 cm $8 00 5890

Contents: The single-point cutting tool. The side relief angle. How to measure angles. The end relief angle. The nose radius and point angle relief. The angle of clearance. Peripheral grinding. The side rake angle. The back rake angle. The side cutting edge (SCE) angle. The end cutting edge angle. The nose radius and the point angle. The cutting rake angle. The proper choice of cutting tools. The cutting edge and chip formation. Chip breakers. Speeds and feeds. Grinding cutting tools. Appendix. Index.

Note. An exceptionally detailed treatment of cutting tools used in the machining of metals. As the chapter titles indicate, much attention is given to such points as relief clearance, rake and cutting edge angles. These matters and other pertinent ones are discussed in detail and are shown in numerous illustrations. Full consideration is given to differences in tools made of the various cutting materials, such as the tool steel, stellite and cemented tungsten carbide. The book will be valuable both to practical machinists and to mechanical engineers in charge of machine-shop operations.

STANLEY, FRANK ARTHUR

Punches and dies layout, construction and use. Fourth edition New York McGraw Hill Book Company, Inc., 1950 583 p. illus. 24 cm. $7.50 5891

Contents (abridged) Section I, Blanking and piercing dies and other tools Types and applications of press tools. Dies for piercing and blanking. Carbide dies and their uses. Section II, Compound dies and other cutting dies. Principles of compound dies. The sub press and its dies. Section III, Dies for shaving and trimming. Section IV, Drawing processes and tools Drawing dies and drawing methods. Combination dies and compound dies. Section V Bending and forming tools and operations Methods of bending and forming. Selfoperating tools. Section VI, Horn dies, embossing and indexing dies, and mechanisms. Section VII, Presses and dies for large parts. Section VIII, Tool standards, layout and construction methods. Punch and die standards. Laying out and making templets and dies. Locating holes accurately in die work. Contour machines on die work. List of references. Index.

Note A well-known handbook written for the guidance of machinists and tool designers. It is competently written and fully illustrated. Technical developments which have occurred since 1943 have been incorporated into the text of this edition, and new chapters have been added on carbide dies, drawing dies, and contour machines. The chapter arrangement has been altered, and the data previously found in "Various supplements" is now included in the appropriate sections.

THOMPSON, TORGER G, AND ROSS A. PETERSON

Illustrated jig-tooling dictionary New York The Macmillan Company 1947 349 p. illus. 24 cm. $1 95 5892

Note The technique of visual education has been successfully applied to these definitions of basic terms, tools, parts, operations, and procedures associated with jig building and tool making. Items are presented pictorially with brief textual explanations. In many instances the tool or unit is shown both in operation and assembled. There is no instruction in techniques. Nevertheless the student and inexperienced toolmaker should find this book an extremely useful source of information. The appendices contain many convenient tables including cutting speeds, thread dimensions, tap drill sizes, typical heat treatments for SAE steels, stresses and deflection of beams, and information on keys and bushings.

Fisher, Charles Aurand

Shop mathematics. Revised edition. Milwaukee: The Bruce Publishing Company 1955. 395 p. illus. 23 cm. $3.24 5907

Contents: Common fractions. Decimal fractions. Square root. Measuring instruments and [illegible] cylinders. Applied algebra. Measuring instruments. Applied geometry—constructions—angles. Logarithms. Shop geometry. Taper and taper turning. Screw threads. Pulley and gear speeds. Thread cutting on [illegible] lathe. Speeds and feeds. Gearing. Cutting speeds. Computations on work, power, and energy. The slide rule. Tables. Glossary of shop terms. Index.

Note: An extended text for use in vocational schools and vocational departments of general high schools. It [illegible] useful also as a [illegible] book. Shop mathematics is correlated [illegible] shop practice by means of practice material, questions on shop practice, and [illegible].

Henry Ford Trade School

Shop theory: the Shop Theory Department of the Henry Ford Trade School Dearborn Michigan. Revised by Fred Nicholson. Fourth edition. New York McGraw Hill Book Company Inc., 1955 329 p. illus. 28 cm. $6.95 5908

Contents: Small tools. Chisels and chipping. Hack saws and sawing. Files and filing. Soldering. Measuring tools. Drills and drilling operations. Tapers. Threads. Gearing. Cutting tools. Shaper. Planer. Lathes. Turret lathes. Milling machines. Gages and gage [illegible]. Heat-treatment. Abrasives and grinding [illegible]. Grinding [illegible]. Testing of bench and work. Appendix. Corrected list [illegible]. Index.

Note: Developed at the Henry Ford Trade School in Dearborn and originally published by that school, this book has been one of the most successful introductory texts on machine shop work. The first trade edition was published by McGraw-Hill in 1942, and the fourth edition [illegible] revision of it. The book is intended for use [illegible] courses offered to young men [illegible] are preparing for careers in machine tool operation. No previous acquaintance [illegible] the field [illegible] assumed, and the exposition begins with descriptions of hand tools and progresses to the standard machine tools and operations on them. This fourth edition contains much new material, both text and illustrations, and the publisher has given the book [illegible] and more attractive format. A majority of the chapters are organized in the form of questions and answers.

Hine, Charles Oliver

Machine tools at work: applications of modern machine tools of various types illustrated by selected examples from actual practice in many different shops, accompanied by close-up action photographs and condensed descriptions including outstanding features of each job, with speed, feed and other practical shop data. Second edition. New York The Industrial Press 1953 554 p. illus. 23 cm. $6.50. 5909

Contents (abridged): Operations on machine tools of the lathe type. Lathes designed for turning duplicate parts. Typical machining operations on turret lathes. Automatic machines which turn parts from bar stock. Automatic machines which turn parts held in chucks. Cutting external screw threads with dies. Milling external and internal screw threads. Grinding screw threads. Tapping with single- and multiple-spindle machines. Drilling holes with machines of single-spindle type. Drilling holes with machines of multiple-spindle type. Boring with standard and special machines. Rifling gun barrels. Planetary milling operations on bars and plates. Punching and forming sheets and plates. Planing, shaping and slotting operations. Milling with machines of horizontal-spindle type. Milling with vertical machines and attachments. Multiple-spindle milling operations. Milling irregular forms by reproducing [illegible] model. Broaching with vertical and horizontal machines. Grinding external surfaces of circular cross-section. Grinding holes or internal surfaces. Centerless grinding operations. Grinding flat or plane surfaces. Honing and superfinishing processes. Examples of gear cutting and gear-tooth finishing. Machine tools designed for [illegible] purposes. Miscellaneous operations of standard and special tools. Index.

Note: Unusual operations such as the contour machining of propeller blades on [illegible] planer, forming of internal splines [illegible] gear shaper, and the high-speed milling of aluminum are described in this book. Hundreds of photographs of the tools in use are included. Some information is included on speeds, rates of feed, etc., and there are numerous descriptions of special tools. The first edition [illegible] published in 1942. This second edition contains [illegible] new chapters.

International Business Machines Corporation

Precision measurement in the metal working industry. Prepared by the Department of Education of International Business Machines Corporation. Revised edition. Syracuse N Y Syracuse University Press, 1952 365 p. illus. 26 cm. $6.50. 5910

Contents: History and basic principles. Line measurement. Fixed gages. Screw threads and thread gages. Dial gages and test indicators. Micrometers and verniers. Precision gage blocks. Surface plates and accessories. Angular measurement. Comparison measurement. Optical instruments. Measuring machines. Surface roughness. Hardness testing. Non-destructive testing. Index.

Note: The instruments and techniques of precision measurement in machine shop work and in the inspection of manufactured metal articles are described in this outstanding book. Techniques are described concisely and pictures are included of all instruments. The book is organized for use as [illegible] text in vocational courses and is useful also for elementary reference. The first edition [illegible] published in 1943 in [illegible] volumes, and various revised versions were issued subsequently. In this edition, first published in 1952, it was given new and attractive one-volume format.

Johnson, James Francis

Applied mathematics. Milwaukee The Bruce Publishing Company 1939 438 p. illus. 21 cm. $2.20. 5911

Contents: Fractions. Decimal fractions. Money. Percentage. Linear measure. Board measure. Square measure. Cubic measure. Shop formulas. Summary of tables and formulas.

Note: A text for home study, high schools, vocational and trade schools, and apprenticeship courses. The book deals with the practical applications of mathematics to everyday problems in industrial activities, manufacturing, and trade work. Illustrations and drawings are used to provide training in the interpretation of shop sketches and working drawings.

Keal, Harry Morton and Clarence J Leonard

Technical mathematics. Second edition. New York John Wiley & Sons, Inc., 1938. 3 v illus. 18 cm. Vol. I, $3 96 vol. II $3.24 vol. III $2 96. 5912

Contents: Volume I, The equation, the formula, and the graph. The equation. Formulas. Positive and negative numbers. Fractions. Ratio, proportion, and variation. Cutting speed, pulleys, and gears. Powers and roots. Right triangle. Radicals. Quadratic equations. Simultaneous equations. The graph. Index. Volume II, Geometric proof, and use of the natural functions. Triangles. Parallel lines. Similar polygons. Right triangulation. Circles. Areas. Planes [illegible] not all in the same plane. Shop problems involving [illegible]. Area [illegible]. Miscellaneous constructions. Volumes. Surfaces and solids of revolution. Appendix. Index. Volume III, Trigonometry applied problems, and the slide rule. Right triangles. Logarithms. Trigonometric equations. Identities, and formulas. Oblique triangles. Miscellaneous applications. Slide rule. Appendix. Formulas for reference. Index.

Note: A work designed to demonstrate to the student the connection between the mathematics class and the shops, laboratories, and drawing rooms. The matter is so arranged that it may be used as [illegible] whole or in individual units. Problems have been selected with view to their practicality.

McMackin Frank Joseph and John H. Shaver

The mathematics of the shops. Second edition. Princeton D Van Nostrand Company

milling, and broaching Third edition. New York McGraw Hill Book Company, Inc. 1948 523 p illus 23 cm $7 50 5900

Contents (abridged) Section I, Drilling Drills and drilling machines. General drilling information Deep-hole drilling. Section II, Reaming and tapping Design construction and use of reamers. Taps and screw threads. Section III, Planers and shapers: Planers, shapers, and slotters. Planer tools. Shapers. The slotting machine. Section IV Milling: Primary milling operations. Types of milling machines. Universal indexing centers. Milling-machine attachments. Section VI, Broaching General information about broaches. Commercial broaching. Index.

Note. A practical instruction and reference book for apprentice machinists. The construction uses, care, and operation of the various machine tools are described and useful data regarding sizes, speed, and power required for drills and cutters are included. In this edition, most chapters have been expanded to cover new machines and practices, particularly those dealing with milling cutters, deep-hole drilling, taps and screw threads, and commercial broaching. The data contained in the wartime supplement of the previous edition have now been incorporated into the appropriat chapters.

COLVIN, FRED HERBERT, AND FRANK A. STANLEY

Grinding practice, typical machines and methods used in a wide variety of work. Third edition New York McGraw Hill Book Company, Inc., 1950 419 p illus. 24 cm $6 00 5901

Content The grinding machine in industry Typical grinding machines. Automatic and semiautomatic equipment. Cylindrical grinding in general External and internal grinding. The centerless grinder Centerless-grinding operations. Size control in precision grinding. Examples of precision grinding. Surface grinders and their work. The magnetic chuck. Grinding crankshafts and other motor work. Grinding heavy rolls. Cutter and tool grinding methods. Types and uses of grinding wheels. Mounting and dressing heels. Lapping and honing machines. Polishing and buffing. Index.

Note This standard text for vocational school courses provides general view of the machines and methods used in modern grinding practice. The more widely used machines are described and illustrated, and typical grinding operations are discussed in detail. Data regarding operating speeds, sizes, and types of wheels are tabulated throughout the book. The general scope and purpose of this edition remain the same as in the previous edition, but the chapters have been rearranged and the Wartime supplement of the 1943 edition has been incorporated into the body of the text. Revisions and additions account for 70 additional pages.

COLVIN, FRED HERBERT, AND FRANK A. STANLEY

Running a machine shop Second edition. New York McGraw Hill Book Company, Inc. 1948 521 p illus 21 cm $7 50 5902

Contents Modern machine-shop practice. Planning shop. Shop equipment. Shop transport and materials handling. Toolrooms and tool cribs. Work in the shop. Estimating. Apprenticeship and training. Management. Foremen and personnel relations. Inspection systems. Postwar supplement. Index.

Not A ell-known, standard ork on the organization and management of machine shops. The new material in this edition is all in the 67-page section entitled Postwar supplement. Here many subjects are touched upon, but the emphasis is on job evaluation and time and motion studies.

COLVIN, FRED HERBERT, AND FRANK A STANLEY

Turning and boring practice. Third edition. New York McGraw Hill Book Company Inc., 1948 531 p illus 24 cm $6 50 5903

Contents Section I, Lathes (in general) Modern machine-shop practice. The lathe. Chucks and chucking. Tapers—turning and boring in the lathe. Thread cutting. Fundamentals of accuracy with V block, mandrel, arbor and surface plate. Examples of modern lathes. Section II, Turret and semi-automatic lathes: The turret lathe. Other modern turret lathes. Semi-automatic lathes. Section III, Automatic screw machines: Automatic screw-machine work. Setting up and operating automatic screw machines. Brown and Sharpe automatic screw machines. Multiple-spindle automatic screw machines. Collets, chucks, and tools. Screw-machine taps and dies. Miscellaneous tools and methods. Section IV Boring machines: Boring machines. Section V Cutting tools for different materials. Single-point tools. Sintered-carbide tools. Speed and machinability Suggestions for machining various metals. Machining nonmetallic materials. Functions of cutting oils. Index.

Note. A practical guide for machinists, apprentices, shop executives, and others interested in the operation of machines used in turning and boring of metals. Discussions of essential principles and of major problems involved in the different operations are followed by descriptions of the more important types of machines and methods of operation. Useful data regarding speeds and feeds, cutting alloys and materials, and use of coolants are included. In this revision the material contained in the "Wartime supplement of the previous edition has been incorporated into the text proper, and new data have been added on mandrel and taper work on lathes, precision boring, and carbide tools.

DICK, ARTHUR A.

Shop mathematics, with basic and functional applications New York The Ronald Press Company, 1943 230 p illus. 21 cm. $3 00 5904

Contents Arithmetic fundamentals: Fractions and decimal fractions. Review of fundamentals. Addition of tabulations. Scales and spacing problems. Conversion of decimals and fractions. Reading the micrometer Square root, using square and cube root table Algebraic equations. Addition type of equation. Subtraction type Division type. Multiplication type. Combination types. Illustrative problems using the algebraic equation. Geometrical constructions Areas, volumes, surfaces, arcs, flats, sides, of rectangle, square trapezoid, cube, circle, ellipse, sphere, triangle, hexagon, octagon cone prism, cylinder, etc. Applications to floor areas, lumber measure, rings, composite figures, hollow cylinders, balls, sectors etc. The right triangle principles, its applications. Mechanics applications. Tapers, belts, pulley speeds, threads, spur gears, introducing proper terminology Practical trigonometry: Sine and cosine formulas.

Note. A textbook for shop mathematics courses and vocational subjects of high-school equivalence. The predominant philosophy of the book is that mastering basic fundamentals is not in itself sufficient, but must be correlated and integrated with practical applications.

EDWARDS, WILLIAM HERBERT

Precision shop mathematics. Boston D C. Heath and Company, 1947 314 p illus. 23 cm $3 00 5905

Contents Precision shop arithmetic. Mathematics of the shop formula. Precision shop geometry Precision shop trigonometry The mathematics of shop tapers. Machine operation formulas. Screw threads. Standard gear dimensions. Index.

Note. A sound, practical introduction to the accurate methods of computing hich are required in present-day machine-shop work. The mathematics is directly related to the practical use of such instruments as gage blocks, micrometer calipers, snap gages, toolmakers' buttons, and machine tools found in modern shops. The book is intended for trade-school students and for beginning machinists.

FELKER CHARLES AURAND

Machine-shop technology Milwaukee Bruce Publishing Company 1952 491 p. illus 23 cm $4.80 5906

Contents Hand-tool operations. Power saw The drill press. Center drilling and straight turning on the lathe. Facing and other lathe operations. Turning and boring tapers. Cutting screw threads. The shaper The planer The milling machine. Milling-machine indexing. Helical milling. Gears and gear cutting. Grinding machines. Metals used in the machine shop. Appendix. Index.

Not An introductory text for use in practical courses in vocational schools, general high schools, industrial training programs, etc. Except for the first chapter, it is devoted to machine tools and basic operations on them. A considerable number of the 319 illustrations are photographs the others are reproductions of line drawings. Both are ell reproduced.

For an introductory textbook designed for use in trade schools and vocational courses in high schools. It combines descriptions of tools and working tools with explicit instructions for carrying out operations with them. Machine tools rather than hand tools are explained. There are more than 330 illustrations.

STIERI, EMANUELE

Fundamentals of machine shop practice. Englewood Cliffs, N J Prentice-Hall, Inc. 1956. 322 p. illus. 29 cm. (Prentice-Hall technical-industrial-vocational series Claude H. Ewing, editor) $6.65 5920

Contents: Machinists' hand and bench tools. Measuring and layout tools. Construction and basic operation of the bench or engine lathe. Lathe cutting tools. Fundamental lathe operations. Plain turning. Taper turning. [illegible] machining procedures. Threads and thread-cutting fundamentals. Spinning lathe. Drilling machines. Drilling procedures on upright or vertical drills. Milling machines. [illegible] milling machines. Shapers. Fundamental shaper operations. Planers. Grinding fundamentals. Grinding operations. Tool and cutter grinding. Appendix. Index.

Note: A simplified introductory text. The standard hand and machine tools used in machine shops are identified both by verbal descriptions and illustrations. The parts of tools, also, are named and shown in pictures, for instance one of the figures identifies each part of a portable electric drill as the trigger switch and the chuck. Uses and operating techniques are described in the same [illegible] and detailed manner. Illustrations are clearly reproduced. The book should be useful for home study personnel in connection with formal instruction course or with apprentice work in machine shop.

TURNER, WILLIAM PAYSON AND HALSEY F OWEN

Machine-tool work fundamental principles. Second edition. New York McGraw Hill Book Company Inc., 1945 364 p. illus. 23 cm. $5.00. 5921

Contents: General shop instruction. Safety in the shop. Machine-shop materials. Cutting speeds and feeds. Measurement and measuring devices. The lathe. Lathe-tool shapes. Lathe operations—straight turning. Lathe operations—taper turning. Boring and facing. Knurling. [illegible] Lathe operations—screw [illegible] threads. The shaper. The planer. The milling machine. Milling [illegible]. Gears and gear cutting. Turret lathes and their [illegible]. Automatic and semiautomatic lathes. Drilling and drilling machines. The grinding machine and grinding methods. Broaching and broaching machines. Problems in machine-tool work. Appendix. [illegible] list of motion pictures. Index.

Note: This textbook is based on material used in courses at Purdue University. Its primary purpose is to present an introductory survey of machine-shop tools and processes for engineering college students. When used in the classroom it is intended to be supplemented with lecture, pictures and laboratory work. Nevertheless, it is also an excellent book for individuals who wish a compact, profusely illustrated introduction to the subject for self-instruction. It has been extensively rewritten and revised from the first edition (1932)

WAGENER, ALBERT M. AND HARLAN R. ARTHUR

Machine shop theory and practice. Second edition. New York D Van Nostrand Company Inc., 1950 306 p. illus. 28 cm. $3 60. 5922

Contents: Rules and scales. Semi-precision and common precision tools. Shaper—planer. Lathe. Tool room lathes. Lathe work. Milling machines. Mill operations. Dividing head work. Vertical mill. Cylindrical grinders. Internal grinders. Surface grinders. Cutter grinding. Grinding wheels. Bench hand tools and their operations. Bench: materials — lay-out drilling—threading—scraping—heat treating. Formulas and tables. Index.

Note: A textbook designed to teach the elements of shop work to beginners, including both adults who are being trained to do mechanical work and also high school and vocational students. It was developed by the authors in teaching activities at the Henry Ford Trade School and the neighboring Naval Training School. Standard machine tools and operations on them are described in simple, straightforward style and are illustrated in well-reproduced photographs and drawings.

WOLFE, JOHN H, AND OTHERS

Simplified industrial mathematics by John H. Wolfe William F Mueller and Seibert D Mullikin. New York McGraw Hill Book Company Inc., 1942 281 p. illus. 20 cm $3 75 5923

Contents: Common fractions. Addition and subtraction of decimals. Multiplication and division of decimals. Square root. Precision instruments. Geometry symbols and formulas. Ratio and proportion. Tapers. Percentage. Geometry. Trigonometry right triangles. Trigonometry oblique triangles. Screw threads. Gears. Table of trigonometric functions. Greek alphabet. Answers. Index.

Note: Presents an abundance of practical problems of the type found in the everyday activities of industry. The chapter on precision instruments and measurement contains illustrations and drawings that aid the student in reading the rule, micrometer, vernier caliper and vernier protractor. Screw threads and standard types of gears are fully treated. A special feature is the series of original formulas which simplify the solution of many shop problems.

METALWORKING AND FOUNDRY WORK

AMERICAN FOUNDRYMEN'S SOCIETY

Analysis of casting defects. Chicago American Foundrymen s Association 1947 133 p. illus. 23 cm. $2 75 5924

Contents: Outline of causes of gray iron casting defects. Blows—gas holes, porosity, pin holes and blisters. Scars, seams and plates. Shot iron or cold shots. Shrinkage cavities and depressions. Hot tears and cracks. Mass hardness. Hard spots—hard areas and chilled spots. Warped castings. Open grain structure. Misruns and cold shuts. Inclusions—dirt, slag and other material. Cuts and washes. Erosion scabs. Expansion scabs—buckles, [illegible], blacking scabs and pull-downs. Crushes, [illegible] and [illegible]. Drops. Stickers or [illegible]. Rough surfaces. Metal penetration. Fusion. Swells, fins, strains and [illegible]. Shifts. Core raise. Runout or runaway. Cores—wrong cores. Improperly set cores and omission of cores. Runouts and bleeders. Broken castings. Inverse chill. Poured short. Kish. Defective test specimens. Index.

Note: In this book each one of the casting defects listed in the contents above is illustrated in one or more photographs. Accompanying each photograph, or set of photographs, is a tabulation of the causes of the particular defect. The book is intended for foundrymen and its purpose is to aid in reducing the number of defective castings produced.

AMERICAN FOUNDRYMEN S SOCIETY

Cast metals handbook. 1944 edition. Des Plaines, Ill. American Foundrymen s Society 1944 756 p. illus. (part col d) 23 cm. 5925

Contents (abridged): Recommendations to designers of castings. Design of pattern equipment. Selection of alloys. Bibliography. Recommendations to buyers of castings: Data required for intelligent estimation of casting costs. The significance of strength and ductility tests of metals. Cast steel: General information. Methods of manufacture. Metallurgy. Properties and applications of carbon cast steels—low alloy cast steels—high alloy cast steels. Heat treatment of steel castings. Testing methods for cast steel. Bibliography. Malleable iron: Metallurgical features. Methods of manufacture. Cupola malleable iron. Pearlitic malleable iron. Cast iron: Methods of manufacture. Metallurgy. Heat treatment. Bibliography. Non-ferrous alloys: Copper and copper-base alloys. Aluminum-base alloys. Magnesium-base alloys. Lead-base alloys. Nickel-base alloys. Appendix. Index.

Note: An authoritative reference book used by foundrymen, metallurgical engineers and machine designers. It contains discussions of the various aspects of castings covered in the chapter titles listed above and presents a wide range of data in graphical and tabular form. The 1944 edition was the third. The fourth edition was published in 1937 [illegible] p., $10.00.

Inc., 1947 468 p illus. 22 cm. $4 25 5913

Contents Measurement. Common fractions. The micrometer and decimal fractions. Measuring surfaces and finding volumes and capacities. Formulas and important ideas from algebra. Computation, accuracy and the use of the slide rule. Pulleys, belts, and gears. Some ideas from geometry Screws, bolts, nuts. Work, power energy and stresses. Some ideas from trigonometry The mathematics of the building trades. The mathematics of the electrical shop. The mathematics of the machine shop. The steel square and its use. Appendix. Index.

Note. A practical textbook which describes and illustrates many of the calculations required in the machine shop the electrical shop, and the various building trades. Brief reviews of the methods of arithmetic, algebra, geometry and trigonometry are distributed throughout the text, immediately preceding the use of these mathematical methods in solving technical problems.

MOORE, RICHARD F , AND FREDERICK C VICTORY

Holes, contours and surfaces located, machined, ground and inspected by precision methods. Including Woodworth circular tables Bridgeport The Moore Special Tool Company, Inc., 1955 422 p. illus. 26 cm $7 50 5914

Contents The problem of location. Improvised location equipment and methods. The foundation of accuracy Engineered location equipment standards. The coordinate locating system. Jig boring principles and applications. Jig boring practices. Jig grinding principles and applications. Jig grinding holes. Jig grinding contours. Linear form grinding principles and applications. Linear form grinding practices. Inspection methods. Precision pays dividends. Woodworth circular tables. Index.

Note. Accurate location and production of holes, contours and surfaces is essential in making tools for the precision manufacturing of interchangeable parts. This book presents techniques for location and generation which are based on the use of four machines developed and manufactured by the sponsoring company Traditional methods, such as buttoning and transferring, are briefly described and their faults pointed out then the newer methods are described in full detail. The textual descriptions are supplemented by over 300 illustrations, most of which illustrate either techniques or tools produced by them. Almost 200 of the volume's pages are devoted to the "Woodworth circular tables" which are tables of co-ordinate factors and angles for laying out from 3 to 100 holes on a circle. The book supersedes an out-of-print publication of the same company published in 1946 under the title *Precision hole location for interchangeability in tool making and production.* Much new material has been added in this volume, including that on contours and surfaces, the chapters on linear form grinding, and on inspection methods.

PORTER, HAROLD W , AND OTHERS

Machine shop operations and setups. By Harold W Porter, Charles H Lawshe and Orville D Lascoe. Chicago American Technical Society, 1954 397 p illus. 22 cm $5 50 5915

Contents Machine shop—preparing for opportunities. Measuring tools—semiprecision and precision. Bench tools, including layout and power saws. Drill press—construction, types, setups, and operations. Engine lathe—construction, cutting tools, and accessories—setups and operations. Shaper and planer setups and operations. Milling machine construction, cutting tools, and accessories. Milling machine setups and operations. Grinding machines—surface, cylindrical, and internal grinding. Quiz questions. Index.

Note A carefully planned and well-organized introductory text intended for use by men who are preparing for careers as machinists. The basic measuring tools, bench tools, and machine tools are described in simple, explicit language. The main emphasis is on how work is set up and how the machines are operated in the basic machining operations. The book is thoroughly illustrated, and the illustrations are clear and well reproduced.

SCHLARMAN, H.

Manual of die head thread cutting. New York McGraw Hill Book Company, Inc., 1949 266 p illus. 21 cm $4.50. 5916

Contents. Producing threads—equipment and methods. Unusual die-head adaptations. Types of die heads and chasers. Die-head troubles and maintenance. Chaser facts for the thread man. Principles and methods of sharpening the radial chaser Principles and methods of sharpening the tangent chaser. Principles and methods of sharpening the circular chaser. General information on chaser usage. Gaging external threads. Thread troubles. Thread samples and analysis. The draftsman and the thread. Appendix. Index.

Note A detailed description of the basic principles and methods of cutting threads by the use of self-opening die heads and chasers. The manual is intended to serve as a practical guide for the man on the job, and deals largely with the construction and operation of the machines and thread-gaging instruments. Special attention is given to methods of locating and eliminating the causes of poor workmanship, and to the proper maintenance of machines and tools. The book is well illustrated with numerous photographs and diagrams, thread formulas and pertinent standards and specifications are included in the appendix.

SHUMAN, JOHN THEODORE, AND OTHERS

Machine shop work, a comprehensive treatise on approved shop methods, including construction and use of tools and machines, details of their efficient operation and a discussion of modern production methods by John T Shuman in collaboration with Horace H. Lowell, Lewis H. Brado, J O Corbin. Chicago American Technical Society, 1942 499 p illus. 21 cm $6 00 5917

Contents Common hand tools. Chipping. Filing and scraping. Hand threading. Linear measurement. Fixed gages and their uses. Layout tools and how to use. Drilling machines. Engine lathes. Grinding. Planers, shapers, milling machines. Gearing. Broaching. Turret lathes. Index.

Note. A practical book with emphasis on the fundamental use of tools, especially the operation of standard tools. Questions supplement each chapter

SLADE, SAMUEL, AND LOUIS MARGOLIS

Mathematics for technical and vocational schools Fourth edition. New York John Wiley & Sons, Inc. 1955 574 p. illus. 20 cm. $4 48 5918

Contents. Common fractions. Decimal fractions. Percentage. Ratio and proportion. Mensuration. Practical computation. Logarithms. The slide rule. Miscellaneous problems. Graphs. Measuring instruments. Practical algebra. Geometrical constructions. The essentials of trigonometry Strength of materials. Work and power. Woodwork. Tapers. Speed ratios of pulleys and gears. Screw threads. Cutting speed and feed. Gears. Milling machine work. Belting. Tables. Index.

Note This textbook, intended for self-instruction as well as for class use in vocational high schools, covers the essentials of arithmetic, algebra, geometry and trigonometry needed in the drafting room and shop. Sixty-three pages of mathematical tables are included. The fourth edition retains the same scheme of organization as previous editions, but some sections have been rewritten and many new problems have been added.

SMITH, ROBERT ERNEST

Machining of metal Revised edition. Bloomington McKnight & McKnight, 1949 224 p illus. 27 cm. $3 60 5919

Contents (abridged): Safety Measurements and measuring instruments. The tool grinder and its operation. Drills and drilling. The lathe and its operation. The shaper and its operation. The milling machine and its operation. The power hack saw and its operation. Metal cutting band saws and their operation. Surface grinding machines and grinding. Appendices Reference list. Projects. Appendix. Index.

industry machinery and tools, and related subjects, including the oxy-acetylene welding and cutting process, with a special course in elementary and advanced sheet metal work and pattern drafting for technical and trade school instructors and students also for reference and study by sheet metal workers and apprentices, by J S. Daugherty Chicago F J. Drake & Company 1941 542 p. illus. 18 cm. $3.00. 5932

Contents: The sheet metal industry. Sheet metal working materials. Sheet metal working tools. Sheet metal working school shop equipment. Course in elementary and advanced sheet metal work and pattern drafting. Outline course in sheet metal work—emergency or trade. Oxy-acetylene welding and cutting. Electric welding. Outline course in [illegible] practice. Outline course [illegible] and welding—emergency or training. Bending. Pipe bending. Properties of metals and their alloys. Practical geometry and [illegible]. Useful tables. Stainless steel. Index.

Note: A manual for practical workers and vocational students. Course in sheet metal work and pattern drafting, large practice, and [illegible] and welding are presented in outline form, with special emphasis on training for war work.

Bruce, Leroy Fowler

Sheet metal shop practice. Chicago American Technical Society 1951 251 p. illus. 22 cm. $4.00. 5933

Contents: Sheet metal working tools and machinery. Sheet metals [illegible]. Using patterns and cutting metal. Punching, drilling and riveting. Folding edges. Forming, crimping, beading and [illegible]. Notching, clipping, and wiring. Soldering. Turning, [illegible], and seaming. Basic principles of pattern development. Parallel line development. Radial line development. Triangulation. Welding. Index.

Note: A timely edition, well-illustrated book which is suitable for use as text in vocational courses and as [illegible] for mechanics in need of specific information on how to do particular metalworking operations. Each chapter is complete in itself (or nearly so) and therefore can usually be used without reading the others. All of the more [illegible] tools and operations performed in small shops are described in the text and shown in the illustrations.

Campbell, Harry Linn

Metal castings. New York John Wiley & Sons, Inc., 1936 318 p. illus. 23 cm. $5.00 5934

Contents: The metal-casting industry. Materials for the foundry. Molding practice. Core practice. Melting processes for cast iron. Methods and equipment for cleaning and [illegible] castings. The [illegible] of cast iron. The properties of cast iron. The classification of iron castings. Calculation of the metal charges for the cupola. Malleable iron castings. Steel castings. Non-ferrous metal castings. The design of metal castings. Comparative properties of the cast metals. Appendix. Index.

Note: A treatise on the materials and processes employed in the production of metal castings. The reasons for the selection of materials and the procedures used in the manufacturing processes are explained. Special consideration is given to the constitution, properties, and classification of the cast ferrous and non-ferrous alloys. The relationship of design to the production of metal castings is an important division of this study. A bibliography is appended to each chapter. An appendix presents tabulated data, standard specifications for cast metals, and foundry control methods. The book may be used as [illegible] guide and reference for foundry managers and operators and also for mechanical engineers.

Campbell, James S. jr.

Casting and forming processes in manufacturing. New York McGraw Hill Book Company Inc., 1950 536 p. illus. 23 cm. $7.00. 5935

Contents (abridged): Molding materials and equipment. Molding techniques. Making the [illegible] molds. Solidification and cleaning. Gating. Sand testing. Pattern equipment. Molding machines. Cores and coremaking. Metals for sand casting. Melting. Cleaning and finishing. Mechanization. Inspection. Sand-casting design. Centrifugal casting. Precision investment casting. Permanent-mold casting. Die casting. Plastics, molding and forming. Powder metallurgy. Rolling. Forging. Sheet-metal working. Punch-press work. Index.

Note: A condensed survey of modern foundry processes and certain alternative processes such as forging. Substantially more than half of the space is devoted to the casting of metals and to the finishing of the [illegible] products. Rolling, forging, sheet metal working, etc., are given less space, but enough is said about each technique to convey [illegible] idea of it and its uses. The book is designed chiefly as a [illegible] for upperclass engineering students. A generous general introduction [illegible], a number of illustrations has been used, and the chapters conclude with short bibliographies. The book is intended as a companion to *Machine tools for engineers*, by C. R. Hine (see Index)

Dietert Harry W

Foundry core practice. Second edition Chicago American Foundrymen s Society, 1950 548 p. illus. 23 cm. $10 00 5936

Contents. Introduction. Core sands—types of locations. Core binding materials. Core mixtures. Storage and conditioning of core materials. Mixing equipment, operations, distribution and storage. Coremaking methods and equipment. Coremaking methods and equipment. Factors affecting coremaking. Core ovens and their equipment. Core finishing operations. Core coatings. Core handling. [illegible]. Core [illegible] properties of cores and core mixtures. [illegible] for determining the properties of cores and core mixtures. Controlling core properties. Core setting. Core knock-out. Core sand reclamation. Casting surface as affected by core-sand mixtures. Economics of core production. Defects caused by faulty cores. Bibliography. Index.

Note: Materials and techniques of making foundry cores for the casting of metals are described in detail in this well-sponsored book. Originally the material was prepared for delivery as lectures in [illegible] offered at the annual convention of the sponsoring association. The school lectures were first published in book form in 1942. and this revised edition, including descriptions of subsequent developments such as the dielectric baking of foundry cores was published in 1950.

Doe, Edwin W

Foundry work. Prepared in cooperation with the Textbook Committee of the Educational Division American Foundrymen s Society New York John Wiley & Sons Inc. 1951 109 p. illus. (part col d) 24 cm. $1 96 5937

Contents: The foundry industry. Fundamental foundry processes. Foundry tools and equipment. Patterns. Sand molding. Baked sand cores. Melting and pouring metals and alloys. Cleaning and finishing castings. Occupational advantages in the foundry. Glossary of foundry terms. References and visual aids. Index.

Note: A textbook especially prepared for use in high schools and vocational schools. It contains a clear description of the common foundry processes and techniques. There are about 100 illustrations, a high proportion of these being reproductions of photographs of operations in foundries.

Doehler, H. H

Die casting. New York McGraw-Hill Book Company Inc., 1951 502 p. illus. 24 cm. $8.50 5938

Contents: Die-casting machines. Die-casting dies. Theoretical and practical aspects of die casting. Design of die castings. Comparison of die castings with other production processes. Die metals. Die-casting alloys. Finishing of die castings. Machining of die castings. Trimming and [illegible] of die castings. Inspection of die castings. Estimating the cost of die castings. Safety in the die-casting plant. Glossary of terms used in die casting. Index.

Note: A comprehensive manual written by one of the outstanding authorities on the subject. In addition to full discussions of the main aspects named in the chapter titles, there are discussions of such topics as spectrographic control of alloy composition, ultrasonic inspection of die parts, and inspection procedures for finished castings. There are literature references and an adequate number of illustrations.

AMERICAN FOUNDRYMEN'S SOCIETY

Foundry sand handbook. Sixth edition Chicago American Foundrymen's Society, 1952 265 p illus. 24 cm $5.25 5926

Contents (abridged) Introduction. Mode of occurrence of sands and clays. Methods for sampling foundry sands and clays. Preparing foundry sand mixtures for testing. Methods for determining fineness of foundry sands—standard. Determining moisture in foundry sand mixtures—standard. Determination of permeability of foundry sands. Strength of foundry sand mixtures. Method for determination of green surface hardness—standard. Determining the sintering point of sand mixtures. Elevated temperature tests on foundry sand mixtures. Chemical analysis of sand—non-standard tests. Tentative method of testing core binders (tensile strength) Mechanical properties of core sand mixtures. Method for determining strength of core paste—tentative standard. Non-standard tests. Interpretation of room temperature sand tests. Comments on maintenance of testing equipment. Foundry molding sand mixtures. Conversion tables. Terms used in foundry sand work. Bibliography on sand testing and control. Subject index.

Note. A standard manual of sand testing methods, tests, and testing equipment. The previous edition appeared in 1944 The present edition is an extensive revision which includes both new and revised tests. The useful bibliography contains chronological arrangement of papers and reports which hav appeared in the *Transactions* of the sponsoring society bibliography of the sand resources of the states of the United States of America and Canada, and an international bibliography arranged by country of publication on sand and sand testing.

AMERICAN FOUNDRYMEN'S SOCIETY

Handbook of cupola operation Second edition. American Foundrymen's Society, 1954 332 p illus 24 cm. $10 00 5927

Contents Section I, Introduction The history of the cupola. Calculating the cupola chart. Refractory lining and daily maintenance. Coke bed. Charge preparation in charging the cupola. Fluxing and slag control. Tapping and slagging. Control of melting temperature and melting rate. Composition control and manipulation of mixtures. Alkali desulfurizers and desulfurizing. Some operating problems and techniques. Cupola records. Chemical and physical controls. Economics of cupola operation. Basic cupola. Cupola melting of malleable iron Section II, Equipment The conventional cupola. Mechanical charging equipment. Forehearths and ladles. Blowing and blast control equipment. Blast conditioning. Slag and cupola drop disposal methods. Equipment for measuring temperature of molten iron. Control of cupola emissions. Special cupolas and accessories. Section III, Materials Pig iron. Scrap for cupola mixtures. Alloys and cupola melting. Cupola fuels. Cupola fluxes. Cupola flame. The cupola refractory lining. Section IV Principles related to operations Principles of fluxing and slag control. Combustion in the cupola. Thermochemistry and the heat balance. Metallurgy of cast irons. Appendix Classified references on cupola practice. Bibliography on cupola practice. General information tables. Index.

Not A full-scale treatise and reference manual on the operation of the cupola furnace in the melting of metals. It describes all the operations mentioned in the chapter titles and provides many tables of reference data. There are 325 figures in this edition and many of them are reproductions of photographs of actual foundry scenes. An extensi e bibliography of literature published 1925–1943 is included. The work is addressed to practical foundry workers and others who need technical information on the operation of the cupola. The first edition as published in 1946 This second edition contains much new matter and is the result of several years' work by reactivated committee under the chairmanship of H. Bornstein

AMERICAN SOCIETY OF MECHANICAL ENGINEERS

Manual on cutting of metals with single-point tools. Prepared by the ASME Research Committee on Metal Cutting Data and Bibliography New York The American Society of Mechanical Engineers 1952 546 p illus 22 cm $10 00 5928

Contents (abridged) Part I, Types, uses and preparations of single-point tools. Part II, Metallurgical and mechanical factors in using single-point tools. Part III, Cutting fluids used with single-point tools. Part IV The machining of various metals. Part V Forces, power and cutting speeds for specific conditions, turning ariety of metals. Part VI, The economics of metal cutting. Part VII, Tabular data on cutting speeds and horsepower (from the first edition). Bibliography Index.

Note. An authoritative ork used by mechanical engineers, foremen, machinists and other technical personnel concerned with the production of metal parts. It is based on a comprehensive survey of all available data, both published and unpublished, and on the results of experiments made under the direction of the Committee. It presents very ide range of data from descriptions of cutting tools to specific data on cutting speeds. The information is presented in a concise text, many graphs and large number of tables. A first edition was published in 1939 This second edition is the result of thorough revision and reorganization. It includes many new data, some topics not represented in the first edition, and is more than 200 pages longer

BENEDICT, OTIS

Manual of foundry and pattern shop practice. New York McGraw Hill Book Company, Inc., 1947 361 p illus. 19 cm. $5.00. 5929

Contents Foundry practice. Molding practice. Molding tools and equipment. Molding operations. Cores and coremaking. The cupola. Pouring molds and cleaning castings. Technological control. Structure of cast iron. Testing cast iron. Nonferrous. Patternmaking. Pattern allowances. Pattern materials. Cores, core prints, and core boxes. Construction methods. Band saws, circular saws, and machine knives. Characteristics of ood. Seasoning lumber Glues. Plywood and veneers. Metal patterns. Problems for pattern design and pattern construction. Appendix. Bibliography List of visual aids. Index.

Note This introductory text is outstanding for its detailed descriptions of tools, materials, and methods. Tools, down to the most commonplace, are not only described but illustrated. The discussion of materials includes not only principal materials, but minor ones as well, such as the adhesives used in making laminated wood for use in pattern making. Processes such as preparing mold for simple casting are described step by step. There is also some material on foundry recordkeeping.

BOSTON, ORLAN WILLIAM

A bibliography on cutting of metals, 1864–1943 New York American Society of Mechanical Engineers 1945 547 p. $6.50. 5930

Note. An annotated bibliography of the literature of metal cutting. Citations include the author, title, name of periodical, volume, date and pagination and are followed in each instance by short note which describes the scope of the article. The work incorporates the earlier bibliographies of the same author *A bibliography on the cutting of metals*, New York, 1930, and *A bibliography on the cutting of metals, Part II*, Ann Arbor 1935 and has several thousand new entries in addition. The main arrangement is chronological, but there are good author and subject indexes.

BOSTON ORLAN WILLIAM

Metal processing Second edition. New York John Wiley & Sons, Inc. 1951 763 p. illus 24 cm $8 50 5931

Contents (abridged) An introduction to the study of machines, tools, and processes. Lathes. Shapers. Planers. Nomenclature and materials for single-point tools. Cutting fluids. Machinability. Milling. Sawing. Drilling, boring, reaming, and threading. Turret lathes, screw machines, and hand-controlled production turning machines. Automatic turning machines. Broaching. Gears and their manufacture. Grinding, polishing, buffing, honing, and lapping. Presses, punches and dies, and formed parts. The quality of surface finish. Drives for machine tools. Accounting and costs. Index.

Note. A treatise on machine tools, machinability and metal cutting ritten for college students of engineering. For the noncollege reader the book's special virtue is that it gives more comprehensive view of the subject from the engineer's viewpoint than is provided in books written for men who operate the machine tools. In the edition, there is fair amount of new material including the chapter on surface quality

BROEMEL, LOUIS

Sheet metal workers' manual a complete practical instruction book on the sheet metal

Mechanical Engineering

Metalworking

HOFFMAN OSCAR, AND GEORGE SACHS
Introduction to the theory of plasticity for engineers. New York McGraw Hill Book Company Inc., 1953 276 p. illus. 23 cm. $7.50. 5945

Contents: Part I. Basic laws and theories. State of stress. State of strain. Elastic behavior of metals. Theories of strength. Plastic stress-strain relations. Experimental data. Part II. Problems in [illegible] Thick-walled spherical [illegible] for [illegible] plastic materials. Thick-walled tube under internal [illegible] pressure. Thick-walled tube. Torsion and bending. Two-[illegible] rotating cylinders and disks. Torsion and bending. Two-[illegible] Part III. Problems in plastic flow [illegible] plane-flow problems. Torsion and bending in the strain-[illegible] Instability in tension. [illegible] Buckling of compressed bars. Drawing and extruding [illegible] Theory of metal-forming processes: Drawing and extruding [illegible] Drawing and extruding of cylindrical bodies. Drawing and extruding through tapered dies in condition of plane [illegible] Drawing and extruding through stationary tools of circular [illegible] condition of plane strain. Rolling of sheet and strip in [illegible] of plane strain. Nonsymmetric plastic flow through the [illegible] of plane strain. Forging. Forming of thin-walled [illegible] in plane strain. [illegible] Index.

Note: A well-organized introduction to the basic theory of elastic behavior of ductile metals and to the application of this knowledge [illegible] forming, extruding, rolling, forging, etc., of these metals. It is [illegible] textbook for advanced students of engineering and as [illegible] for graduate engineers who are concerned with metal [illegible] Although much of the exposition is mathematical, the [illegible] does not assume the knowledge of mathematics beyond [illegible] Tensors are employed, but their mathematics is developed [illegible] the book. Literature references are included.

HULL, DANIEL R.
Casting of brass and bronze some practical aspects of brass and bronze casting in America, 1900 to 1950. Cleveland The American Society for Metals 1950 186 p. illus. 23 cm. $3.50. 5946

Contents: Things as they were. Melting. Pouring. The bronze. [illegible] hydrogen and deoxidizers. The mold. The mold dressing. [illegible] Conclusion. Index.

Note: An expert, very readable review of brass and bronze foundry [illegible] Although changes in the industry are sketched briefly in the first chapter, most of the text deals with current practices. The [illegible] at the time of writing, Assistant Technical Manager of the American Brass Company and his book reflects long experience with brass and bronze casting.

KAMERLEIN JOSEPH J
Short cuts for round layouts a textbook and working guide with practical and modern methods for laying out and forming patterns for round and oblong fittings, T's, elbows, and hoods mathematical formulas applied to sheet-metal work. Milwaukee The Bruce Publishing Company 1947 288 p. illus. 24 cm. $4.00 5947

—— Triangulation short-cut layouts a textbook and working guide with practical and modern methods for laying out and forming patterns used for blower-exhaust sytems, heating, and air conditioning mathematical formulas applied to sheet-metal work. Milwaukee The Bruce Publishing Company 1948. 288 p. illus. 26 cm. $5.50 5948

Note. These books, together with the author's *Air conditioning sheet metal layout*, Milwaukee, Bruce Publishing Company 1941, 308 p., $4.00, [illegible] set that is designed for the practical instruction of students in vocational schools and beginners in the sheet-metal trades. Each book consists mainly of [illegible] series of plates that illustrate rapid, geometric methods of laying out typical sheet-metal constructions. Each plate is accompanied by one or more paragraphs of step-by-step instructions.

KILEY HENRY E. AND JOHN H. PAUSTIAN
Pattern design. Second edition. Scranton Pa. International Textbook Company 1952 193 p. illus. 21 cm. (International texts in mechanical engineering Charles Fayette Taylor consulting editor) $4 75 5949

Contents. Pattern details. Molding details. Metals used in pattern construction. Construction work and joints. Design for low cost production. Pattern department management. Special designs. Explanation of work required in planning pattern equipment. Problems in pattern design. Glossary Index.

Note An established practical text, used both in the instruction of engineering students and the vocational training of men preparing to become pattern makers. It is an introduction to the design and construction of wooden patterns used in the casting of metal parts. There are more than 200 illustrations. The first edition written by R. R. Hall and Henry E. Kiley was published in 1939

KYLE, P E.
The closed die forging process. With co-operation of the Technical Committee of the Drop Forging Association. New York The Macmillan Company 1954 140 p. illus. 22 cm. $1.50 5950

Contents: Introduction. Fundamentals of hot working. Forging processes and equipment. Heating for forging. Preliminary and [illegible] forging operations. Making of drop forging die. Preliminary forging operations. [illegible] of drop forgings. Testing and inspection. Forged metals. Typical closed die forgings. Glossary of forging terms. Index.

Note An introductory description of one of the most important present-day metalworking techniques. It is intended for such readers as vocational school students, engineering college students and graduate engineers hence, technical terminology is freely used. Die-making is not covered, but all other aspects of closed die forging, including the importance of forgings, are at least touched upon. Not [illegible] in the table of contents but present in the book is section of tables of data on properties of steel and other metals used in forgings. There is an occasional footnote reference to other literature, but no attempt at bibliography There are more than 50 illustrations.

LUDWIG OSWALD A.
Metalwork technology and practice. A first course for the metal trades. Third edition. Bloomington Ill. McKnight & McKnight, 1955 399 p. illus. 26 cm. $4.00. 5951

Contents: Planning the job. Sawing and bench work. Getting acquainted with metals. Care of equipment. Drill press work. Threads, dies, taps. Fitting and assembling. Work with sheet metal. Heating metal. Tool sharpening. Finishing and inspecting. Machine tools. Index.

Note An outstanding vocational school text. It contains large amount of elementary basic information on tools, materials and operations. The style is straightforward and easy to understand. There are over 1200 illustrations, and all are clearly reproduced, often in large scale. An exceptionally full index makes the book useful also for elementary reference—to find description of "tolerance" for example.

MCCASLIN HERBERT JOHN
Wood patternmaking a textbook. Fourth edition. New York McGraw Hill Book Company Inc., 1946. 366 p. illus. 19 cm. $4.50. 5952

Contents (abridged) Machines and tools. Part I, Bench work: Pattern woods. The plane. A word model. Pattern features. Machine finish. Pattern [illegible] Dowel pins. Core box for the clamp pattern. Core box for the guide pattern. The planning of core [illegible] Core boxes for the pedestal pattern. Core box for the support pat-

Du Mond, T C

Shell molding and shell mold castings. New York Reinhold Publishing Corporation, 1954 128 p illus. 18 cm $2 00 5939

Contents. What is shell molding? Advantages and limitations of shell molding. What about costs? Selection factors—materials, sizes, quantities, tolerances and finishes. Designing for shell molds. How shell molding compares with competitive processes. Cores by shell molding. The process and equipment for its use. Materials for shells and patterns. Applications of shell molding. Appendix. Selected references. Index.

Note The casting of metal parts in thin shells made of sand and a plastic resin is a process which has already gained wide acceptance in the United States of America, although it was not known here until 1947 Shell molding' is the accepted term for it, although it has been known also as the "C-Process" and Croning-Process. This small book is both a survey of the present status and an expert discussion of advantages and disadvantages. Numerous case histories on the use of the process for the production of specific parts are described, usually with data on tolerances and costs included. The illustrations depict both steps in the making of shell molds and parts cast in them. The short bibliography includes some literature published as late as the first half of 1954

Giachino, Joseph William, and John L Feirer

Basic bench-metal practice and precision measuring Peoria Chas A Bennett Co, Inc., 1943 160 p illus 26 cm $3 68 5940

Contents Fields of metal work Finding size of stock for cutting. Cutting metal. Scribing a layout. Chiseling metal. Filing metal. Drilling metal. Reaming holes. Grinding, sharpening, and buffing metal. Bending, twisting, and forming metal. Decorating and finishing metal. Joining metal. Caliper and gauge reading. Producing, processing, and identifying iron and steel. Safety in the shop. Tabular appendix. Index.

Note. The material in this textbook for industrial education courses consists of 31 job units presented in the form of controlled and detailed guide to the exploration, study and mastery of the fundamental operations of the metalworking field. The ork is divided into two parts: first, hat a student must be able to do, and second, what student must know in order to perform successfully the given tasks. The methods are fully illustrated with step-by-step drawings and photographs.

Hanel, Alexander V

Text in patternmaking Milwaukee The Bruce Publishing Company 1949 314 p illus. 24 cm $2 96 5941

Contents (abridged) Molding and pattern allowances. Tools. Lumber Pattern supplies and their use. Machinery Pattern layout. Pattern joinery Segmental and staving construction. Core prints and core boxes. Gear patterns. Cast construction. The foundry Job Hexagonal block. Cylinder Link. Surface plate. Anvil base. Base bearing. Bracket bearing. Angle bracket. Bearing caps. Double bearing. Tapered column. Quadrant. Screw propeller Glossary of patternmaking and molding terms. Index.

Note A clearly written ell-illustrated text on wood pattern making. It is designed for use in a full year course in vocational high schools. Also, it can be read for information by beginning workers in foundries. All of the fundamental tools and processes are covered, and the Job" section gives detailed directions for the construction of the patterns for 40 typical castings.

Heine, Richard W, and Philip C Rosenthal

Principles of metal casting Prepared in cooperation with the Textbook Committee of the Education Division American Foundrymen's Society Des Plaines Illinois. New York McGraw Hill Book Company Inc. 1955 639 p illus 24 cm $7.50 5942

Contents: Introduction. Patterns. Molding processes and materials. Molding equipment and mechanization. Molding sands. Cores. Core materials. Solidification of metals. Pouring and feeding castings. Metals cast in the foundry Aluminum foundry practice. Aluminum casting alloys. Copper-alloy foundry practice. Copper-base casting alloys. Special casting alloys. Steel-foundry practice. Steel melting in the foundry Metallurgy of cast steel. The family of cast irons. Melting of cast irons. Gray-iron foundry practice. Metallurgy of gray iron. Malleable iron. Cleaning and inspection. Casting-design considerations. Index.

Note. In this well-sponsored book, the casting of metals is treated from the viewpoint of college students of engineering who are preparing for careers in mechanical engineering or in metallurgical engineering. Both basic theory and practical techniques are covered, with somewhat more emphasis on the latter. Specialized terms are defined, and foundry practices are described in unexpected detail. Recently accepted techniques such as shell molding are included. The book contains extensive literature references and hundreds of illustrations as ell as many tables of useful reference data. Although designed as textbook, it should be useful also to technicians already at work in the foundry industry and to engineers and technically trained people in other fields who find themselves in need of authoritative information on present-day techniques of metal casting The authors are faculty members of the University of Wisconsin.

Herb, Charles Oliver

Die-casting, the die-casting process and its application in modern manufacture, die-casting machines, design of different types of dies, composition and properties of die-casting alloys, and the die-casting of zinc, aluminum brass, and other non ferrous alloys. Second edition. New York The Industrial Press, 1952 310 p. illus. 24 cm. $5 00 5943

Contents The die-casting process and its applications. Die-casting machines and their development. Alloys for die-casting. Die-casting dies and their operation. Multiple cavity dies for duplicate castings. Dies with auxiliary slides for exterior cores. Sliding cores in movable and stationary dies. Adjustable dies for parts of different dimensions. Standards for designing die-casting dies. Steels for die-casting dies. Die-casting ith semi-automatic machines. Die-casting thin sections. Die-casting brass. Die-casting by the vacuum process. The salt system of die-casting. Die-casting cast iron. Index.

Note. A standard descriptive treatment, ritten by the editor of the periodical *Machinery* It is useful survey of the die-casting process and of die-casting machines and dies. There are many excellent illustrations, most of which show details of equipment. The first edition appeared in 1936. Although the titles of several chapters have been reworded, no new chapters have been added in this edition. Parts of the book, for instance the chapter on die-casting machines, have been revised to bring them up to date. The book is only 10 pages longer, but somewhat more than 10 pages of material has been added because certain obsolete material has been dropped.

Hinman, Chauncey Weed

Pressworking of metals a reference book illustrating and describing the uses of metal-working presses and many types of press tool designs. Second edition New York McGraw Hill Book Company, Inc. 1950 551 p. illus. 24 cm $9.00 5944

Contents Standard types of power presses. Pressworking commonly used materials. Press accessories and feeding equipment. Designing chutes, magazines, and hoppers. Automatic stops and die accessories. Blanking and cutting dies. Two-step or tandem dies. Progressive dies. Blank and scrap strip developments. Perforating and piercing. Shaving, burnishing, and trimming. Sectional dies and inserts. Bending, forming, and embossing. Dies for assembling work parts. Swaging, coining, and cold-sizing. Dies for drawing and redrawing. Unusual dies and novel operations. Formulas and reference tables. Index.

Note A clearly written and practical guide to the art of power working ferrous and nonferrous metals. The workability of various materials and the selections of machines are discussed, but the book deals mainly with the design, construction use, and operation of presses and dies. This edition has been largely rewritten and includes information regarding press tools, accessories, and new operating practices which ha been developed since 1941 Progressive dies and machines are described in more detail, and a chapter on perforating and piercing has been added. Again, numerous photographs and diagrams of equipment are included.

...ing Corporation, 1950. 286 p. illus. 24 cm. $7.00. 5959

Contents (abridged). Structure of fluids and the phase rule. Structure of the solid state. Specific heat. Changes of state and latent heat. Free energy and binary equilibrium. Supercooling. Electric heat. Free energy and binary equilibrium. Carbon and hydrogen combustion and heat losses in steady state. Heating of furnace charges. Heat transfer in unsteady state. Heating of furnace charges. Rate of movement of high temperatures. Direction of reactions. Macrostructures. Origin and control of carbon in ferrous alloys. Macrostructure of non-carbon alloys. Effect of alloying elements on microstructure of non-carbon alloys. Fluid mechanics of casting. Gating and feeding. Statistical control of processes. Supplementary reading. Some notes. Subject index.

Note: Rather than a text on foundry practice, this book is an exposition of fundamental chemical and physical phenomena and principles that affect metal-casting processes. It is based on a series of lectures on theoretical metallurgy and foundry physics given by the author at the Case Institute of Technology. Although the original lectures were addressed to graduate engineering students, the material has been somewhat simplified in the book, and can now be studied at least by foundry engineers and supervisory personnel as well as by engineering students.

Simpson, Bruce L.

Development of the metal castings industry. Chicago, American Foundrymen's Association, 1948. 246 p. illus. 27 cm. $6.00 5960

Contents: Prehistoric development of metal. Far Eastern foundry development. Casting development in the Mediterranean basin. Molding and melting methods of the Renaissance. Casting of bells and guns. Sand castings of direct blast-furnace iron. The early iron foundry. Colonial foundries in the New World. Metals and melting in the nineteenth century. Development of foundry mechanization. Bibliography. Index.

Note: A broadly illustrated history of founding. It begins with the earliest records and carries the story to about the beginning of the present century, although a few later innovations, such as the invention of the high-frequency induction furnace, are included. The text is essentially an outline, but some care has been taken to give the origin and dates of important developments and inventions. The pictures show both founding processes and products of foundries and are of general interest.

Steel Founders' Society of America

Steel castings handbook. 1950 edition. Prepared under the direction of the SFSA Handbook Committee. Charles W. Briggs, editor. Cleveland, Ohio, Steel Founders' Society of America, 1950. 511 p. illus. 23 cm. $1.50 5961

Contents: A brief history of the steel casting industry. Classes and advantages of steel castings. Commercial applications and industrial uses of steel castings. Steel casting design. The manufacture of steel castings. Heat treatment. Variables affecting the mechanical properties of steel castings. Mechanical properties of carbon cast steels. The properties of low alloy cast steels. Heat and corrosion resistant cast alloys. Austenitic manganese cast steel. Physical values pertaining to cast steel. Engineering properties of cast steel. Recommendations to purchasers of steel castings. Steel casting specifications. Definitions of foundry terms. Appendix: Chemical compositions of standard steels. Index.

Note: A reference manual and practical treatise for foundry workers, engineers, and others whose work requires a technical knowledge of steel castings. A factual text is supplemented by many excellent photographs of castings and equipment, and by tabulated data regarding the composition and properties of various steels. This edition has been revised to include the technological developments which have occurred since 1941. The chapters on low alloy cast steels and heat treatment, in particular, have been rewritten, and material has been added on pattern making and new types of alloys. The chapter bibliographies have also been brought up to date.

Wood, Rawson L., and Davidlee Von Ludwig

Investment castings for engineers. New York, Reinhold Publishing Corporation, 1952. 477 p. illus. 23 cm. $10.00. 5962

Contents: History and description of investment casting. The master pattern and pattern die. Making soft metal dies. Wax versus plastic patterns. Frozen mercury for disposable patterns. Gating, runnering, clustering, venting wax and plastic patterns. Investment materials and techniques. The ceramic shell mold or mercast process. Melting and casting methods. Selection of low-temperature nonferrous alloys for investment casting purposes. Selection of ferrous and refractory alloys. Foundry finishing investment castings. Foundry inspection operations. How to machine investment castings. Product design development by means of investment castings. Castings to replace fabricated parts. Design suggestions for investment castings. Investment castings for chemical and high temperature resistant applications. Some metallurgical observations of investment cast alloys. Some machinability tests on stainless steel. Bibliography. Index.

Note: The special slant of this treatise is indicated by the title. In other words, the book is written not from the viewpoint of founders but of engineers who design products to be cast or are responsible for the finishing of them after casting. The various investment processes, including not only "the lost wax" process but those in which other materials are used for the disposable pattern, are fully described, and particular attention is given both to their advantages and their limitations. Supplementary topics, such as the selection of alloys for products to be made by investment castings, are adequately covered. The text is supplemented by a substantial number of tables of engineering data. The book is based on a series of articles written by the authors and published in *Iron Age* and other journals from 1948 through 1951. Only a short bibliography is included.

MANUFACTURING

Begeman, Myron Louis

Manufacturing processes. Third edition. New York, John Wiley & Sons, Inc., 1952. 608 p. illus. 24 cm. 5963

Contents (abridged): Foundry practice. Pattern work. Metal casting. Special casting methods. Heat treatment of steel. Welding and allied processes. Hot forming of metals. Cold forming of metals. Powder metallurgy. Plastic molding. Inspection. Lathes and lathe tools. Turret and automatic lathes. Threads and thread cutting. Shapers and planers. Drilling and boring machines. Milling machines and cutters. Gears and gear-cutting machines. Metal sawing. Broaching machines and tools. Abrasives, grinding wheels, and grinding machines. List of tables. Index.

Note: A comprehensive, descriptive survey of present-day manufacturing methods and machines. Its purpose is to inform upperclass engineering students and also engineers and management personnel in industry about the available processes and their applications. Most of the book is devoted to manufacturing with metals, but the author has included one chapter on plastics. A fourth edition was published in 1957. 612 p. $8.00.

Clapp, William Howard, and Donald Sherman Clark

Engineering materials and processes: metals and plastics. Second edition. Scranton, International Textbook Company, 1949. 526 p. illus. 24 cm. (International textbooks in mechanical engineering, Edward F. Obert, consulting editor) $8.00. 5964

Contents: Part I, Materials: Properties of engineering materials. The structure of metals and alloys. Cooling curves and equilibrium diagrams. Metallurgy, properties, and uses of ferrous metals and alloys—the manufacture of iron and steel—control of properties—the alloy steels and cast iron. Metallurgy, properties, and uses of non-ferrous metals and alloys. Plastics, rubber, and synthetic elastomers. Part II, Processes: The production of castings. Hot-working of metals. Cold-forming of metals. Joining of metals. Machine shop production methods. Lathes, boring mills and screw machines. Milling and drilling operations. Shapers, slotters, planers, broaching machines, and saws. Gears, gear cutting and gear-cutting processes. Abrading, grinding, and finishing processes. Index.

Note: A standard engineering college textbook. Its compact but clear descriptions of standard materials, machine tools, and manufacturing methods give it some value as a reference book. The changes made in preparing the second edition were not major, but they include descriptions of a fair number of new processes and a completely rewritten chapter on plastics and synthetic rubber. At the time of writing, the authors were members of the faculty of the California Institute of Technology.

tern. Core box for the tool-rest slide pattern. Core frame for the bracket pattern. Part II, Lathe work. Face-plate turning. Mounting the material for turning parted patterns. The checking and the inspection of patterns. Glossary of patternmaking and molding terms. Visual aids. Index.

Note Designed for students in practical courses, this textbook in its enlarged and modernized fourth edition contains directions for making 64 typical patterns. There are many new illustrations, and the glossary contains additional terms.

MAREK, CLARENCE THOMAS

Fundamentals in the production and design of castings New York John Wiley & Sons, Inc., 1950 383 p illus 20 cm $5 25 5953

Contents Casting processes. Green sand molding. Foundry sands and sand control. Patterns and related equipment. Cores and their applications. Foundry production equipment. Production planning. Physical and metallurgical properties of cast metals. Properties and uses of ferrous cast metals. Properties and uses of nonferrous cast metals. Melting of cast metals. Cleaning and inspection. Design for economical molding. Design to eliminate defects. Bibliography Appendix. Index.

Note A general introductory survey of the metal-casting processes, written for engineering students and graduate engineers who need some knowledge of these processes but are not directly concerned with foundry practices or management. All the commercially used processes are described, including slush molding, the lost wax process, etc. but most of the space is given to casting in sand molds and to the products of this process. The book is well organized and admirably illustrated. Its purpose is to enable engineers to design cast parts so that they can be produced economically

NAUJOKS, WALDEMAR, AND DONALD C FABEL

Forging handbook Cleveland The American Society for Metals, 1939 630 p illus. 23 cm. $7 50 5954

Contents. Forging industry Forge plant equipment. Die block and process operations steels. Forge dies and tools. Forging practice. Finishing operations. Heat treatment of forgings. Cleaning forgings. Testing and inspection of forgings. Materials handling. Forge plant design. Forge plant maintenance. Furnaces and furnace design. Designing the forged part. Forging materials. Job estimating. Costs and cost engineering. Forge shop safety Forging definitions.

Note Much of the information and data contained in this volume has been obtained directly from manufacturers and is based on their actual experience. Except for brief history of the forging industry attention is directed entirely towards the practical aspects of the subject—forging materials and processes, and the design and operation of forging equipment. Some attention is given to the design of the plant, maintenance routines, and job estimating. The final section contains collection of useful tables, such as weights of metals and alloys, melting points, and die block weights. There are glossary of terms in general use in the forging industry and an index.

RITCHEY, JAMES

Pattern making A practical treatise for the pattern maker on woodworking and wood turning, tools and equipment construction of simple and complicated patterns modern molding machines and molding practice. Revised by Walter W Monroe Charles Wm Beese and Philip Ray Hall Chicago American Technical Society 1938 233 p illus. 21 cm $3 00 5955

Contents Working medium. Hand cutting tools. Measuring tools. Small tools. Machine tools. Molding practice. Patterns. Metal pattern making. Index.

Note This text aims to show the tools and equipment necessary for pattern making, to give design details of simple and complicated patterns for typical cases, to discuss the use of green and dry sand cores and the construction and design of typical molding machines. A new section on metal pattern making is a feature of this revised edition of a ork last published in 1933

RUSINOFF, S E

Foundry practice. Chicago American Technical Society, 1955 261 p. illus. 22 cm. $6.50 5956

Contents Metal casting—a basic manufacturing process. Patterns—their function in sand molding. Sand-molding materials and equipment. Sand-molding processes and core making. Typical molding problems. Machine molding. Sand-handling and conditioning equipment. Metal casting and foundry materials. Metal-melting equipment. Metal-handling and cleaning equipment. Metallurgy of cast metals. Testing cast metals. Other casting processes. Safety in the foundry Bibliography Index.

Note. An elementary practical introduction to present-day techniques of metal casting. Most of the space is devoted to describing the sand casting of ferrous alloys, but other casting processes and other families of alloys are at least mentioned. Also included are explanations and descriptions of techniques incidental to casting, such as testing. It is written in style which is easy to read, and the verbal material is supplemented by numerous illustrations. There are a few footnote references to literature and a selected bibliography The book is useful not only to trade-school students, for hom it is primarily intended, but also to new employees in the casting industries.

SACHS, GEORGE

Fundamentals of the working of metals. New York Interscience, Publishers, Inc., 1954 158 p. illus. 22 cm. $4 75 5957

Contents Effects of temperature & speed on forming. Relations between chemical composition, phase changes, & forming characteristics. Effects of grain structure on forming. Some general concepts of metal forming. Basic types of forming methods. Program fabricating. Bibliography Index.

Note. Articles which appeared originally in *Modern industrial press* have been collected in this volume and supplemented by selected bibliography and an index. The articles are written from the iewpoint of engineers and technicians concerned ith metal fabricating by such processes as forging, bending, and drawing. From this viewpoint, basic facts of chemical composition, crystallization, etc., both in general and in direct relation to specific forming processes, are explained. The book is suitable for young mechanical engineers and designers ho ish basic understanding of metal-orking processes in order to get the "feel of hat can be done with metals in the factory

SACHS GEORGE

Principles and methods of sheet metal fabricating New York Reinhold Publishing Corporation 1951 526 p illus. 24 cm. $11 00. 5958

Contents (abridged) Part I, Sheet metal and sheet-metal parts. Part design and metal properties. Formability tests. Sheet metals. General properties of sheet metals Part II, Principles of forming various part types. Bending and straight flanging. Contour forming of sections Forming of deep recessed parts. Forming of shallow recessed parts Part III, Principles of deep drawing Drawing of thin walled cylindrical cups. Redrawing of tubular parts (sinking) Drawing of thick alled cylindrical cups. Dra ing of box shaped parts. Part Press-die forming of sheet-metal parts Press-die forming of parts from developed blanks. Press die forming of recessed parts. Cartridge case fabricating. Impact extrusion and coining. Part V, Various sheet metal forming methods Drop hammer forming of sheet metal parts Rubber forming of sheet metal parts. Stretch forming of smoothly contoured sheet metal parts. Contour forming and roll bending Spinning and roller flanging Index.

Note A treatise written on higher level than the typical text in the field. The main theme is the metallurgical bases for particular techniques. The book is therefore of more interest to engineers in charge of design and production methods in large manufacturing establishments than to workers in small shops. Nevertheless, the treatment is eminently practical, and fabricating techniques are described in explicit detail. There is liberal number of illustrations and the chapters are accompanied by selected bibliographies.

SCHWARTZ HARRY ADOLPH

Foundry science fundamentals underlying foundry practice. New York Pitman Pub-

[illegible] as lead. Recently developed processes, such as shell molding, are included. There are few pages on processes employed in the forming and fabricating of plastics materials, but the coverage of these processes is adequate, in view of their current importance. [illegible] Bibliographies, literature references are included. In addition to its usefulness as a text, the book is useful in libraries as a source of detailed information not only on such techniques as milling and [illegible] but also on how gears are [illegible] [illegible], etc.

RILEY MALCOLM W

Plastics tooling. New York Reinhold Publishing Corporation, 1955 123 p. illus. 18 cm. $2.50. 5972

Contents: Why plastics tooling? Pros and cons of plastics tooling. Plastics—an orientation. The plastics tooling resins. Fabricating [illegible]. Metal forming die tools. Checking, locating and assembly fixtures. Metal forming [illegible]. Plastics forming tools. Die models and prototypes. Experimental tools and the future. Selected bibliography. Index.

Note: An informative survey of a rather new development in manufacturing, the use of plastics instead of metals—or in some cases in combination with metals—in dies and other special [illegible]. The topic is covered primarily from the standpoint of [illegible]. Some information is included on how plastic tools are [illegible], but not enough to guide the tool maker who has had no experience with plastics. On the other hand, advantages and disadvantages from the cost and production angles, life of plastic tools, etc., are discussed in more detail. There is an index, but there are no literature references.

RISENOFF SAMUEL EUGENE

Manufacturing processes Chicago American Technical Society 1949 2 v illus. 22 cm. Vol. 1, $6.25 5973

Contents: Volume 1, Materials. The foundry and sand molding. Production of sand castings. Other casting processes. Hot forming of metals. Cold forming of metals. Welding, brazing, and soldering. Heat treatment of metals. Powder metallurgy. Plastics and plastic molding. Index. Volume 2, Production. The machine shop and metal cutting. Lathe operations and thread cutting. Lathes and screw machines. Milling machines. Drilling, boring, and reaming machines. Shapers, slotters, and planers. Metal-sawing and metal-filing machines. Broaching machines and broaching operations. Gears and gear manufacturing. Grinding and finishing machines. Inspection and quality control. Index.

Note: A practical survey of the major manufacturing techniques. The materials volume is concerned with the processes which generally precede fabricating techniques. The production volume describes the chief machine tools and the principal fabricating and finishing techniques. The work is liberally illustrated, and the chapters are supplemented by review questions and bibliographies. It is suitable for vocational school students and engineering college students. An overall introduction to modern manufacturing. The second edition of Volume II, Production was published in 1957 [illegible] p., $[illegible].

SEAMAN, ROBERT G., AND ARTHUR M MERRILL, editors

Machinery and equipment for rubber and plastics. Volume 1. Primary machinery and equipment. New York India Rubber World, 1952. 804 p. illus. 24 cm. $15.00. 5974

Contents (abridged): Mills. Mill accessories. Mixers. Calenders and accessories. Extruders. Extruder accessories. Presses, compression. Press accessories. Presses, injection. Molds and mold accessories. Web coating and handling equipment. Pressure vessels. Heaters, dryers, and coolers. Tire and tube machinery. Hose and belting machinery. Footwear machinery. Wire and cable machinery. Heel and [illegible] machinery. Latex machinery. Special plastics machinery. Appendix. Index.

Note: The first volume published of a projected two-volume work. It contains signed articles in which kinds of machines are discussed from the standpoint of their characteristics and uses. Systematic descriptions of the machines offered by various manufacturers in the United States of America are given, and a few advertisements included. In the first volume, there are 2 of the signed general articles bearing such titles as "Extrusion and applications of extruders" and "Hard chromium plating of plastic and rubber molds."

SIMONDS, HERBERT RUMSEY, AND OTHERS

Extrusion of plastics, rubber and metals. By Herbert R. Simonds, Archie J Weith and William Schack. New York Reinhold Publishing Corporation, 1952 454 p. illus. 24 cm. $11.00. 5975

Contents (abridged): Part 1, Extrusion of plastics: The plastics extrusion industry. Custom extrusion. Plastic materials for extrusion. Equipment for plastics extrusion. Theoretical aspects. Conditioning of compounds. Design and use of dies. Instrumentation. Monofilaments. Shapes and tubes. Sheeting and films. Plastic coatings on wire and other products. Part II, Extrusion of rubber, metal and miscellaneous materials. Appendix. Glossary. Manufacturers of extruded products. Manufacturers of extrusion equipment. Tables and conversion factors. General index.

Note: A practical survey of extrudable materials and extrusion processes. It is devoted mainly to the extrusion of synthetic plastic materials, but other materials are included as indicated in the title. It is intended for production engineers and others with practical interests in the subject. There are many tables of engineering data, and the numerous illustrations include photographs of extrusion equipment and operations. Possibly because the book is based primarily on a survey of current industrial practices, literature references have been omitted.

SOCIETY OF THE PLASTICS INDUSTRY INC

SPI plastics engineering handbook. New York Reinhold Publishing Corporation 1954 813 p. illus. 24 cm. $15.00. 5976

Contents: Section 1, Materials and processes: Classification of rigid molding materials. Molding. Preforming, drying and preheating. Extrusion and extrusion machines. Forming, drawing and postforming. Reinforced plastics. Casting. Tooling with plastics. Embedding. Vinyl dispersions. Laminated products. Section II, Design: Design of molded articles. Standards for tolerances on molded articles. Design standards for inserts. Mold design and recommended [illegible]. Section III, Finishing and assembly: Machining, finishing, and decorating. Cementing, welding, and assembly. Assembly [illegible]. Section IV, Testing: Testing plastics articles. Section [illegible], SPI standards. Voluntary commercial standards of the trade. Index.

Note: In essence this is the official handbook of technological information for the plastics fabricating industries. The actual authors of the various sections are not identified, but presumably they are included among the members of the 20 subcommittees whose membership is listed in the book in full. Starting materials, machinery, fabricating processes, finishing and decorating and testing are all covered with much specific detail. There are occasional lists of suppliers of materials. However literature references are not given. The first edition was published in 1948 and consisted of only 18 chapters totalling 431 pages. This edition with 20 chapters and 813 pages is organized differently and most of the contents is new.

WENDT ROBERT ERNEST

Foundry work a text on molding, dry sand coremaking, melting and mixing of metals, and problems in foundry management. Fourth edition. New York McGraw Hill Book Company Inc., 1942 261 p. illus. 19 cm. $4.00 5977

Contents (abridged): Preface to the fourth edition. Preface to the first edition. Part 1, Groups of casting metals—tools—flasks—molding sand—fundamental principles of molding. Part II, Exercises in bench and floor molding. Part III, Pattern equipment—standard pattern colors—designing castings—molding machinery—mass production. Part IV Dry-sand coremaking. Part [illegible] Cupolas—melting and mixing metals. Part VI, Non-ferrous metal founding. Part VII, Problems of foundry management—inspection of castings—defective castings—causes of defects—safety in foundries. Index.

Note: A text for vocational schools and for use by apprentices in commercial shops. The fundamental principles of foundry work are explained along with a general description of current foundry practice, including instructions for molding, coremaking, and other foundry work. The making of coke, the operation of blast furnaces, and the chemical analyses of iron have also been added. The fourth edition includes new exercises in molding, a study of the causes of defective castings, safety suggestions, and a glossary and bibliography

CRANE, EDWARD VILLEROY

Plastic working of metals and non metallic materials in presses. Third edition. New York John Wiley & Sons, Inc., 1944 540 p illus 22 cm $9 00 5965

Contents Mass production. Essential metallurgy Shearing metal in dies. The shearing group of press operations. Bending operations. Expanding, contracting and curling. Cold-working of plastic metals. The drawing group of press operations. Drawing speed, lubrication annealing. Cold operations of the squeezing group. Extrusion. Hot press forging. Press characteristics and modifications. Automatic production. Diversified production. Plastic states, metallic and nonmetallic. Molding and forming. Appendixes Problems. Index.

Note. In earlier editions this book was entitled *Plastic working of metals and power press operations*. It constitutes handbook of the mass methods of press working materials, telling how and why metals move and are moved, for use in planning operations, dies, and molds, and in making them function. In this edition the original discussion of sheet metal working and forging has been expanded to include powdered metals, synthetic plastic powders, ceramics, papers, sheet plastics, and laminated materials of many types. Illustrations are given of tools, equipment, and methods.

DELMONTE, JOHN

Plastics molding New York John Wiley & Sons, Inc., 1952 493 p illus 24 cm $10 00 5966

Contents Introduction to plastics molding materials. Hydraulic pumps for molding presses. Mechanical pressure systems. Hydraulic accumulators and packings. Valves for the molding plant. Distribution of gases and fluids. Heat for the molding of plastics. Material preparatory equipment. Compression and transfer molding equipment. Design f compression and transfer molds. Injection molding machines. Design features of injection molds. Extrusion equipment for plastics materials. Finishing accessories for the plastics molding plant. Instrumentation for the molding plant. Plant layout. Author index. Subject index.

Note. A thorough book on the plant and equipment aspects of the plastics molding industry In most of the chapters particular process is described concisely then the machines and equipment for carrying out the process are discussed. However the emphasis is on principles and uses, and the author does not attempt to describe all available machines. Such topics as molds are discussed from the engineering and design viewpoints. The book is of interest to trained engineers concerned either with the organization of plastics molding plants or with their management.

DU BOIS, JOHN HARRY, AND W I PRIBBLE

Plastics mold engineering the fundamentals of plastics mold design and construction. Chicago American Technical Society 1946 494 p illus (part col'd) 22 cm. $7 50 5967

Contents Plastics molding. Plastics product design. Types of molds. Tool-making equipment and methods. Materials for mold making. Designing and drafting practice. Compression molds. Transfer molds. Injection molds. Cold-mold and extrusion die design. Special fixtures. Mold sampling and maintenance. Appendix. Abbreviations and symbols. Index.

Note A relatively thorough treatment. It is intended for designers of plastics articles and for mold-makers. Mold designing and making are treated at length, and there is good deal of useful supplementary material such as tabular statements of the properties of moldable plastic materials, tables of mold pin sizes, ram pressures, screw threads, etc. The book is copiously illustrated with photographs and diagrams of molds and mold-making equipment.

DUMOND THEODORE C

Fabricated materials and parts. New York Reinhold Publishing Corporation, 1953 332 p illus 23 cm. $6 50 5968

Contents The problem of selecting methods for small parts. Cost as a factor in selecting fabricated materials and parts. Production and design factors. Sand castings. Permanent mold castings. Plaster mold castings. Die castings. Investment castings. Drop forgings. Press forgings. Upset forgings. Cold headed parts. Stampings and press formed parts. Impact extrusions. Extruded shapes. Powder metal parts. Spun shapes. Screw machine parts. Electroformed parts. Sectioned tubing. Welded, brazed and adhesive bonded parts. Molded plastics. Formed nonmetallic materials. Index.

Note. In this book, the chief methods available for the manufacture of small parts and shapes are reviewed from the standpoint of design engineers and other technologists concerned with the selection of manufacturing methods. The material in a typical chapter is organized as follows a concise description of the process; primary and secondary operations cost factors advantages and limitations; materials, dimensions and tolerances; design considerations; and a final summary paragraph of advice on how to select the particular process in preference to others. Also included in the book is a long chart entitled, "Cost design and production factors in selecting fabricated materials and parts. The author is editor of *Materials & methods* and the book is based on articles that were published in that magazine.

EPSTEIN, GEORGE

Adhesive bonding of metals. New York Reinhold Publishing Corporation, 1954 218 p. illus 18 cm $2 95 5969

Contents. Introduction—the place of industrial adhesives in metal fabrication. Basic materials for adhesives. Formulation—some typical adhesives. Special high temperature adhesives. Design and testing of adhesive joints. Bonding techniques. Adhesives for metals in sandwich constructions. Appendix: Requirements of Specifications (MIL-A-8431 USAF) Mechanical properties. Selected references. Index.

Note. The joining of metals by adhesives rather than by welding or riveting is already an established technique in certain fields. This small book is an introduction to the kinds of adhesives available, to the methods of using them and to related data of interest in structural and design engineering. No aspect of the topic is treated exhaustively but the information presented is specific and includes exact descriptions of techniques and of adhesives. A list of references is included for the guidance of those who need more information on particular points, but the text is not keyed to the bibliography.

HESSE, HERMAN CARL

Engineering tools and processes, a study of production technique. New York D Van Nostrand Company Inc. 1941 627 p. illus. 23 cm. $7 00 5970

Contents. Engineering materials. Engineering elements. Power transmission elements. Unit-production system measurement. Sand casting processes. Forging and allied processes. Sheet metal working processes. Machining and surface finishing principles. Woodworking processes. Drilling and allied processes. Lathe processes. Single-point tool machining processes. Milling processes. Surface finishing processes. Welding and allied processes. Miscellaneous unit-production processes. Mass-production system measurement. Production system processes. Mass-production casting processes. Appendix Index.

Note This textbook combines the material usually covered in the college shop course, with discussions of the techniques and operations of mass production. It teaches the student the facts and methods about the basic shop processes which are taught to every mechanical engineer and it correlates with these discussions the further developments which have produced the mass production industries. The operating principles of each machine are shown by specially prepared diagrams, and in several instances the illustrations are grouped in series to demonstrate the operational sequence in a particular process.

MORRIS, JOE LAWRENCE

Modern manufacturing processes. Englewood Cliffs N J Prentice-Hall Inc. 1955 533 p. illus. 24 cm. $7 00 5971

Contents The manufacturing synthesis—equipment, methods, and products. Foundry materials. The development of iron and steel products. Foundry practices. Special casting methods, forming plastics, powder metallurgy Working of metals. Heat treatments of metals. Testing of engineering materials. Welding processes and applications. The lathe. Turret lathes and screw machines. Automatic and semi-automatic turning machines. Drilling, boring, reaming. Milling machines. Shapers and planers. Threading. Jigs. Broaching. Gear and gear making. Abrasive processes. Presses and press forming. Gaging and inspection. Index.

Note: A college textbook in which practically all the processes employed in present-day manufacturing of metal articles are at least mentioned. Reasonably detailed descriptions of the major processes and tools are given, but for minor processes the descrip-

GRAHAM, A. KENNETH editor

Electroplating engineering handbook. Prepared by a staff of specialists. Editor A. Kenneth Graham. Assistant editor H. L. Pinkerton. New York Reinhold Publishing Corporation, 1955 650 p. illus. 27 cm. $10.00 5983

Contents Glossary by F A. Lowenheim. Part I, General processing data: Tables of data, by E. B. Bowerman, Jr. Design for plating, by C. F. Kern and others. Metal surface preparation and cleaning, by H. J. Read and others. Typical processing and operating sequences, by A. H. DuRose. Water requirements for plating, by C. E. Fisher and L. R. Sperry. Plating bath compositions and operating conditions, by A. K. Graham. Plating standards and specifications, by F. Ogburn. Trouble shooting, by R. B. Saltonstall. Analysis of plating baths, by M. B. Diggin. Testing electrodeposited coatings, by H. J. Read and others. Waste disposal, by H. L. Pinkerton. Plating and metal finishing costs, by L. J. Durney. Industrial hygiene and safety, by A. D. Brandt. Metallurgy for the electroplater, by H. J. Read. Surface protection and finishing treatments, by A. Durey and others. Part II, Engineering fundamentals and practices: Plant location and layout, by A. K. Graham. Floor-plans and construction, by R. R. Pearce. Tanks, by J. V. Ross and A. K. Graham. Linings, by M. Glover. Heating and cooling practices and equipment, by R. F. Ledford and H. L. Pinkerton. Racks—design, construction, insulation, and maintenance, by E. E. Seago. Manually operated installations, by A. K. Graham. Barrels, by E. G. Salzberg. Semi- and fully-automatic plating machines, by M. J. Mell. Continuous plating equipment for steel mill products, by E. M. Wick. Anode and cathode rod and bus systems, by A. K. Graham. Exhaust systems, by A. P. Brandt. Anodes and rubber-type ... components, and related data, by H. L. Pinkerton. Low voltage D-C generators, by C. Beyer. Rectifiers, by L. W. ... Periodic reverse current plating, by M. Coronn. Rinsing, by H. L. Pinkerton. Drying practices and equipment, by H. L. Pinkerton. Filtration, by H. W. Pratt and A. K. Graham. Auxiliary equipment for the plating room, by H. L. Pinkerton. Maintenance, by R. B. Saltonstall and others. Index.

Note A well-rated, and authoritative reference book. It is addressed to engineers and technicians who are concerned with electroplating from the industrial rather than the academic viewpoint. The contributors are all associated with industrial firms, universities or government units in capacities that indicate authority on the topics about which they have written. In the second part of the volume, electroplating is treated as a chemical engineering process within the purview of chemical engineers as well as technicians. Selected literature references are included in most chapters.

POWELL, C. F., AND OTHERS

Vapor-plating; the formation of coatings by vapor-deposition techniques. By C. F. Powell, I. E. Campbell, and B. W. Gonser. Sponsored by the Electrochemical Society Inc. New York John Wiley & Sons, Inc. 1955, 158 p. illus. 24 cm. $5 50 5984

Contents Introduction. Metals. Carbides. Nitrides. Borons and borides. Silicon and silicides. Oxides. Author index. Subject index.

Note This book is a survey of the present state of vapor-plating, the art of formation of coatings by chemical reduction or decomposition of volatile compounds of the coating materials upon heated surfaces. Physical methods, such as "sputtering" under vacuum, are not included. The historical development, general techniques, and apparatus and applications are treated briefly in the introduction. The chapter entitled "Metals" summarizes for each of the metals—beginning with copper and including less-common ones, such as tungsten and uranium—procedures for forming volatile compounds and for depositing them from the vapor state. Succeeding chapters deal in the same way with the vapor deposition of the major classes of compounds. All of the chapters are based on extensive literature surveys and include lengthy bibliographies to which the texts are keyed. The authors, members of the staff of Battelle Memorial Institute, have themselves made numerous published contributions to the field.

SIMONDS HERBERT RUMSEY AND ADOLPH BREGMAN

Finishing metal products. Second edition. New York McGraw Hill Book Company Inc., 1946 352 p. illus. 21 cm. $9.50 5985

Contents (abridged) Commercial aspects of finish and appearance. Preparation for the finish of metal products. Polishing and buffing. Plating and spray coating. Organic coating. Special finishes. Index.

Note This book is designed primarily for manufacturers and designers of industrial products. It points out the sales value of good finishes, and then reviews finishes and finishing methods from a practical viewpoint. The usual types of finishing are considered, including sprayed-metal coating, enameling, lacquering, and the dyeing of aluminum. In this revision, the entire subject as treated in the first edition (1935) has been brought up to date, and two new chapters added on metal coloring, and electroplating costs and estimating. Of special interest also are the new pages devoted to plating on plastics, special metal coating processes, and electrolytic polishing.

WELDING

ALTHOUSE ANDREW DANIEL, AND CARL H TURNQUIST

Modern welding practice. With the collaboration of George E. Tabraham and Burl E. Ott. Second edition. Chicago Goodheart Willcox Company Inc., 1951 498 p. illus. (part col'd) 22 cm. $5.00 5986

Contents Oxy-acetylene welding theory and practice. Oxy-acetylene welding equipment and supplies. Electric welding theory and practice. Electric direct current arc welding practice, equipment, and supplies. Alternating current arc welding. Electric resistance welding practice, equipment and supplies. Inspecting and testing welds. Soldering and brazing. Non-ferrous welding. Pipe and tube welding. Cast iron welding. Special ferrous metal welding. Cutting. Special forms of welding. Manufacture of metals. Properties and identification of metals. Heat treatment of metals. The welding shop. Modern welding, brazing and soldering applications and equipment. Technical data. Index.

Note This book is used both as a text in vocational schools and as an elementary reference book. All types of welding are covered in a simple, practical style, and the discussions are supplemented by 349 figures and numerous tables of data. The coverage is not encyclopedic but is adequate for beginners. The first edition appeared in 1942. One entirely new chapter has been added in this edition, and there are other useful revisions.

AMERICAN WELDING SOCIETY COMMITTEE ON BRAZING AND SOLDERING

Brazing manual. New York Reinhold Publishing Corporation 1955 193 p. illus. 24 cm. $4 75 5987

Contents Brazing processes, equipment and procedures. Properties of base metals. Brazing filler metals. Fluxes and atmospheres. Drafting room practices. Joint design. Precleaning and surface preparation. Assembly. Techniques of brazing. Postbraze operations. Inspection. Aluminum and aluminum alloys. Magnesium. Copper and copper alloys. Low-carbon and low-alloy steels. Stainless steels. High-carbon and high-speed tool steels. Cast irons. Heat-resistant alloys. Nickel and high-nickel alloys. Precious metal contacts. Other metals. Safety and health protection. Appendix: Properties of brazeable metals and alloys. Index.

Note Brazing is an old method of joining metals, and it is still as important today as it was many years ago. This book is the only modern full-scale treatment of it in English. Each of the chapters—the titles of which are given above—is a concise presentation of information on techniques or of relevant reference data. The 20-page table in the appendix provides data on composition, yield strength, elongation, hardness, melting range, etc., of metals and commercially available alloys which may be joined by brazing. The book is authoritative and complete, except that it does not cover brazing of jewelry or of plastic materials. It is of interest not only to technicians in the metal fabricating industries but also to engineers, product designers and other persons who are interested in metal manufacturing techniques.

AMERICAN WELDING SOCIETY RESISTANCE WELDING COMMITTEE

Resistance welding: theory and use. New York Reinhold Publishing Corporation 1956 163 p. illus. 24 cm. $4.50 5988

FINISHING OF METALS

American Society for Metals

Surface treatment of metals. This book contains the papers and discussions constituting the symposium on the surface treatment of metals presented before the twenty second annual convention of the American Society for Metals held in Cleveland, October 21 to 25, 1940 Cleveland American Society for Metals, 1941 427 p illus 23 cm $5 00 5978

Contents Anodic treatment of aluminum, by J D Edwards. The passivation and coloring of stainless steel, by G. C. Kiefer The surface treatment of magnesium alloys, by H. W Schmidt and others. Corrosion resistance of tin plate—influence of steel base composition on service life of tin plate containers, by R. R. Hartwell. Zinc coatings—unit operations, costs and properties, by J L. Bray and F R. Morral. Diffusion coatings on metals, by F N Rhines. Surface reactions and diffusion, by J E. Dorn and others. Heat treating with induction heat, by E. Blasko. Inherent characteristics of induction and hardening, by M. A. Tran and H. B Osborn Jr Flame pretreatment of structural steel surfaces for painting, by J G. Magrath. Shot blasting and its effect on fatigue life, by F P Zimmerli. Effect of surface conditions on fatigue properties, by O. J Horger and H. R. Neifert. Chip formations, friction, and high quality machined surfaces, by H. Ernst and M. E. Merchant. Observations on the tarnishing of stainless steels on heating in vacuo, by V C. F Holm. The tracer method of measuring surface irregularities, by E. J Abbott.

Note The papers in this volume are for specialists. Most of them are accompanied by bibliographies, and all of them are accompanied by discussion.

Blum, William, and George B Hogaboom

Principles of electroplating and electroforming (electrotyping) Third edition. New York McGraw Hill Book Company, Inc. 1949 455 p illus. 24 cm. $8 00 5979

Contents (abridged) Principles of chemistry Principles of electricity and electrochemistry Factors that govern the character and distribution of electrodeposits. Analysis of solutions. Preparation for electroplating. Electrical equipment. Tanks and their equipment. Types of metals and solutions. Alloy deposition. Appendix. Author index. Subject index.

Note In the 20 years that passed between the second and third editions of this well-known book the basic knowledge of electroplating was greatly extended and the techniques of plating considerably modified. These developments are adequately reflected in this edition. The book is designed for practical workers in the industry and for chemists and engineers who are not specialists in plating but who need, on occasion, a concise and reliable description of plating principles and techniques. Chapters 12 to 21 the titles of which are not listed above, discuss specific metals. Numerous formulas are incorporated in the text, and a selection of pertinent literature is cited in footnotes.

Burns, R M and W W Bradley

Protective coatings for metals Second edition New York Reinhold Publishing Corporation 1955 643 p illus 24 cm. $12.50 5980

Contents Principles of corrosion and corrosion control. Surface preparation for coatings. Types of metallic coatings and methods of application Sprayed metal coatings. Production and properties of zinc coatings. Protective value of zinc coatings. Cadmium coatings and their protective value Tin coatings. Nickel and chromium coatings. Coatings of copper lead, aluminum, miscellaneous metals and alloys. Coatings of noble and rare metals. Methods of testing metallic coatings. Organic coatings—chemistry and composition—performance and evaluation Application and use of protective organic coatings. Chemical conversion and anodized coatings. Special-purpose coatings. Corrosion inhibitors. Author index. Subject index.

Note. Known familiarly as Burns and Schuh, this useful manual has maintained a firm place in most technical libraries for fifteen years. In this second edition, with a new co-author, the book's purpose and the general scheme of organization remain the same. Historical, theoretical and practical information on useful methods of protecting metals against corrosion is presented concisely with emphasis on the practical aspects. The level of treatment is appropriate to an audience composed of such readers as engineers, industrial chemists and product designers. Literature references including patents are cited in footnotes and the names of the authors of the cited literature are assembled in the author index. This second edition represents very extensive revision and augmentation. Certain of the chapters, particularly those dealing with organic coatings and anodized coatings, are new and most of the chapters contain numerous revisions even in those cases where the titles are identical with the first edition. The subject index now runs to 25 pages.

Electrochemical Society, Inc.

Modern electroplating Edited by Allen G. Gray Sponsored by The Electrochemical Society, Inc , New York, N Y New York John Wiley & Sons Inc., 1953 563 p. illus. 24 cm $9 50 5981

Contents General principles, by W Blum and W R. Meyer. Methods of control, by R. A. Schaefer and others. Alloy plating, by C. L. Faust. Brass, by L. E. Weeg and H. J. Wiesner. Cadmium, by K. G. Soderberg and L. R. Westbrook. Chromium Tri-chromium plating process, by G. Dubpernell. Properties of chromium plate, by C. A. Snavely and C. L. Faust. Cobalt, by H. B Linford. Copper Rochelle copper by A. K. Graham and H. L. Read. High efficiency cyanide copper by R. R. Bair and D. Swalheim. Pyrophosphate copper by J E. Stareck. Acid copper electroplating and electroforming, by W H. Safranek and J. Winkler Gold, by L. Weisberg and A. K. Graham. Indium, by H. B Linford. Iron, by C. T Thomas and V A. Lamb. Lead by A. H. Du Rose and W Blum. Nickel, by W L. Pinner and others. Platinum group metals, by E. Schumpelt. Silver by K. Fromkel. Tin Stannate tin, by F Basch and F F Oplinger Acid tin, by P R. Pine and A. H. Du Rose. Immersion tin by F A. Lowenheim. Tin alloys, by F A. Lowenheim. Zinc Acid zinc, by E. H. Lyons, Jr and H. P Munger Cyanide zinc by R. R. Bair and L. J Schmolk. Uncommon metals, by F A Lowenheim. Plating on aluminum and magnesium. Uranium alloys, by F Keller Magnesium alloys, by H. K. DeLong. Appendix, by L. D McGraw and A. E. Tripler Jr Index.

Note. A well-edited reference handbook of background knowledge and specific information on techniques. Each chapter is written by a recognized expert and is based on the literature. The style is concise however, references to source articles are carefully cited for the guidance of those readers in need of fuller discussions of particular topics. The book is a successor to one of the same title published by The Electrochemical Society in 1942 Although some authors contributed to both books, this 1953 volume is essentially new work.

Enyedy, Ralph

Handbook of barrel finishing New York Reinhold Publishing Corporation 1955 255 p. illus. 26 cm. $8.25 5982

Contents. The economics of barrel finishing. Room layout for barrel finishing. Finishing compounds and media. Barrel types. Auxiliary handling equipment. Cleaning and derusting with sawdust. Self-tumbling. Barrel tumbling with chips. Barrel finishing with soft metal grinding forms. Polishing and burnishing in barrels. Barrel finishing with the multibarrel. Self-tumbling in tilt barrels. Parts applicable to chip tumbling. Finishing in small horizontal barrels. Parts applicable to larger horizontal barrels. Parts applicable to triple action barrels. Coloring, polishing and burnishing. When machining comes between operations. Interesting applications of barrel finishing. Index.

Note The finishing process with which this book deals is also called tumbling. In various modifications it is used for a considerable range of operations on metal parts including descaling, deburring, polishing and cleaning. This book, written by a specialist associated with the Westinghouse Electric Corporation, is a comprehensive practical manual of the process and covers its use not only for rough finishing but also for precision work. Aspects, such as equipment and finishing compounds, are covered concisely and explicitly A considerable part of the space is devoted to reproductions of specification sheets that cover a wide variety of finishing operations. These are filled out completely as they would be for actual factory jobs.

[illegible] Arc welding [illegible] by [illegible] and [illegible] Section [illegible] Arc-welded [illegible], by [illegible] Arc-welded [illegible] freight locomotives, by [illegible] Locomotive boilers, by John F. [illegible] Arc-welded passenger cars, by J. E. [illegible] Construction of rail [illegible] cars, by J. C. [illegible] Section [illegible] Small boats arc welded, by William [illegible] and boat [illegible], by [illegible] Section [illegible] Welded [illegible] by [illegible] Steel and [illegible] compared, by [illegible] Welded steel [illegible] for subways, by [illegible] Section [illegible] Furniture and fixtures: Arc welding of [illegible] by [illegible] Bed [illegible] and bed springs, by [illegible] by [illegible] Section [illegible] Commercial welding. Section [illegible] Section [illegible] Machinery: [illegible] by [illegible] welding [illegible] by W. G. [illegible] Arc-welded [illegible] by Richard [illegible] by [illegible] Tractor [illegible] by [illegible] Modern welded [illegible] by [illegible] Arc welding in [illegible] machinery, by [illegible] Index.

Note. A [illegible] of 51 technical papers on various phases of the arc welding process. The authors are executives, engineers, [illegible] of production, construction and maintenance, and each has had considerable experience in his particular field. The papers were chosen from among the hundreds submitted in the Foundation's award program which is designed to stimulate the use of arc welding in industry through research and education in the [illegible] and practical applications of the process.

Jefferson T B., and G. Woods

Metals and how to weld them. Cleveland The James F Lincoln Arc Welding Foundation, 1954 322 p. illus. 22 cm. $2.00 in the U.S.A. $2.50, other countries. 5995

Contents. What's this all about. Mechanical properties of metals. Physical properties of metals. The metals we use. Non-ferrous metals. Methods of welding. Fundamentals of metallurgy. Metallurgy and heat treating. Metallurgy and welding. Welding low-carbon steel. Medium carbon steel. High carbon steel. Welding alloy steels. Cast iron properties and welding. Stainless steels and high chromium [illegible]. Austenitic manganese steel. Non-ferrous metals and alloys. Hardfacing. Tool and die steels. How to make good welds. Appendix. Index.

Note. The first eight chapters of this book are devoted to basic metallurgical knowledge. In the remaining twelve chapters, the basic knowledge is related to welding and welding techniques are described explicitly and in detail. The presentation is elementary and the book is for such readers as vocational school students, [illegible] and practical welders. It is fully illustrated.

Lincoln Electric Company

Procedure handbook of arc welding design and practice. Ninth edition. Cleveland Lincoln Electric Company 1950 1,200 p. illus. 22 cm. 5996

Contents (abridged). Arc welding history, processes, equipment and nomenclature. Weldability of metals. Techniques, procedures, speeds, and costs for welding mild steel. Basic design data for welded construction. Machinery designed with arc welded construction. Designing of arc welded structures. Inspection and testing of weld metal and welding operators. Miscellaneous applications of arc welding and manufacture, construction and maintenance. Index.

Note. A comprehensive reference book on electric arc welding. It describes techniques thoroughly, includes a wide range of reference data, discusses the design of structures to be built by arc welding, and illustrates the applications of arc welding in a variety of fields. The 11th edition was published in 1957. $3.00.

Linde Air Products Company

The oxy-acetylene handbook. A manual on oxy-acetylene welding and cutting procedures. New York. The Linde Air Products Company Unit of Union Carbide and Carbon Corporation, 1943 587 p. illus. 24 cm. $2 70. 5997

Contents (abridged). Part I. General principles of oxy-acetylene process. Historical development of the oxy-acetylene process. The oxy-acetylene flame. Set-up and operation of equipment. General procedures in welding and cutting work. Metal properties important in welding. Tests for identifying metals. Expansion and contraction. Part II. Oxy-acetylene welding of ferrous alloys. The constitution and properties of iron alloys. Fusion welding sheet steel. Fusion welding and steel pipe. Welding steel pipe. Welding wrought iron, high-carbon steel, and cast steel. Welding alloy steels. The [illegible] of bronze-welding. Welding cast iron. Part III. Oxy-acetylene welding of non-ferrous alloys. Welding aluminum. Welding copper and copper alloys. Welding nickel and nickel alloys. Welding magnesium. Welding lead. Part IV. Miscellaneous applications. Bronze surfacing. Hard-facing. Lengthening the [illegible] of wearing parts. Bronze-brazing. Oxy-acetylene heating and flame-treating. Part [illegible] Oxy-acetylene cutting. Principles of oxygen cutting. Manual flame-cutting operations. Machine flame-cutting. Part VI. Inspection and management. Inspecting and testing welds. The business side of welding. Part [illegible] (Appendix). Welding and cutting data. The oxy-acetylene flame and its uses. Index.

Note. Intended primarily as a book of instruction in vocational schools and shops, this manual covers, in a comprehensive manner, most aspects of oxy-acetylene welding and cutting. It has been reprinted many times. [illegible] 1943.

Linde Air Products Company

Welding and cutting manual how to use your oxy-acetylene outfit. Welding cutting heating bending, brazing, soldering. New York Linde Air Products Company 1949 203 p. illus. 24 cm. $1.50. 5998

Contents. The hottest flame on earth—wherever you need it. Forming, bending, and straightening metals. Soldering and brazing with the oxy-acetylene flame. Steel and cast iron cut as easily as wood. Repairing and rebuilding by welding. Hard-face wearing parts for long life. Welding and cutting steel pipe. Points to remember in welding most common metals. 100 things you can make. How to set up and operate your outfit. Appendix. Index.

Note. Addressed to men who are not professional welders, this practical book describes the basic techniques and a variety of applications of oxy-acetylene welding. It is directed to such users of welding as farmers, automobile mechanics, and amateur craftsmen. It is clearly written and very fully illustrated. The chapter entitled "100 things you can make" gives directions and shows illustrations of 100 small devices ranging from domestic inventions to ornamental signs.

Morris Joe Lawrence

Welding principles for engineers. New York Prentice-Hall, Inc., 1951 511 p. illus. 22 cm. $9.00. 5999

Contents. Welding metallurgy. A survey of the welding processes: characteristics and applications. Testing and inspection of welds. Welding of commercial metals. Braze welding, brazing, soldering. Surfacing. Metal spraying. Filler materials. Flame heat-treatment. Oxygen cutting. Stress and distortion. Design for welding. Factors affecting welding production economy. Index.

Note. The special viewpoint of this book is evident from the title and table of contents. Welding is treated as a technique of metal fabrication. All of the practical welding processes are described. Welding techniques are discussed in some detail, but the discussions are directed to design and production engineers rather than to welders. The book was written for use as a text in engineering colleges, but it is suitable also for engineers in industry who desire an over-all view of the subject. There are 33 tables and 245 figures.

Morris Joe Lawrence

Welding processes and procedures. New York Prentice-Hall Inc., 1954 255 p. illus. 22 cm. $5.35 6000

Contents. Electric arc welding. Oxy-gas welding. Electric resistance welding. Miscellaneous welding processes. Welding metallurgy. Welding of commercial metals. Testing and inspection. Stress and distortion. Welding design. Metal spraying and surfacing. Braze welding, brazing, and soldering. Oxygen cutting. Factors in welding economy. Welding exercises. Bibliography. Index.

Note. A relatively short book which is also easy to read. The established methods of welding are described, and related subjects, such as the inspection of finished weld and design for welding, are

Contents Definitions of resistance-welding terms. Principles of resistance welding. Resistance-welding processes. Resistance-welding equipment. Welding symbols. Weldability of metals and precautions required. Weld quality Procedure specifications and qualification. Inspection and testing. A.W.S. standards and books. Index.

Note An authoritative handbook on terminology principles, processes, testing methods, etc. It is addressed to welding technicians, welding inspectors, and also to engineers and designers who are interested in resistance welding as manufacturing technique. Much of the material has been taken from previous publications of the American Welding Society however it is rendered more available and convenient to use in this manual. The volume is well organized and is adequately illustrated and indexed.

AMERICAN WELDING SOCIETY WELDING HANDBOOK COMMITTEE

Welding handbook. Third edition. New York American Welding Society, 1950 1 651 p illus 24 cm. 5989

Contents (abridged) Fundamentals of welding Standard welding terms and their definitions. Physics of welding. Fundamentals of welding metallurgy Gas welding processes. Arc welding processes. Resistance welding processes. Miscellaneous welding processes Forge welding. Thermit welding. Induction welding. Surfacing and metallizing. Brazing. Soft soldering. Cutting processes. Metals Iron wrought iron and carbon steels. Chromium irons and steels. Aluminum and aluminum alloys. Magnesium and magnesium alloys. Copper and copper alloys. Nickel and high-nickel alloys. Lead and zinc. Clad steels. Design and cost considerations. Inspection and quality control. Applications. Buildings. Bridges. Machinery construction. Pressure vessels and boilers. Railroads. Automotive products. Aircraft. Transmission pipe lines. AWS standards. Standard welding symbols. Standard methods for mechanical testing of welds. Author index. Subject index.

Note A standard encyclopedia of information about welding. Pictures of equipment and techniques are included, as are bibliographies of pertinent literature. In this edition the work has been substantially revised with much added material. The type was reset, and the book is now printed two columns to the page. The subject index ally revised with much added material. The type was re-set, and the alone runs to 69 pages. The fourth edition is being published in five sections. The first section appeared in 1957 560 p., $9.00.

AUSTIN, JOHN BENJAMIN

Electric arc welding Chicago American Technical Society, 1952 280 p illus. 22 cm. $4 00 5990

Contents History and scope of welding. Arc welding machines. Electric arc welding accessories. Fundamentals of arc welding. Lessons in electric arc welding. How to weld common metals and alloys. Hard facing. Pipe welding. Arc-welding symbols. Machinery welding Structural welding. Common methods of testing welds. Special metal arc processes. Index.

Note A simply written, practical text for vocational school students and beginning welders. In addition to the descriptions of arc welding equipment and general techniques, information is included on number of specialized techniques, such as bell hole welding in pipeline construction. The book is generously illustrated.

BRUCKNER, WALTER H

Metallurgy of welding New York Pitman Publishing Corporation 1954 290 p illus 24 cm. $7 50 5991

Contents Heat flow in metals. Metallic arc welding Torch welding with gases and gas Arc welding with carbon and tungsten electrodes, protective and inert gases. Pressure welding. Thermit welding. Resistance welding. Bonding with brazing, bronze and eutectic. Surface treatments hard facing, flame hardening and metal spraying Residual stresses, distortion, and stress-relieving methods. Specifications for base metal, electrodes. Weldability of metals. The economics of welding and design. Appendixes Metallurgical principles. Special digests of welding literature. General reference books. National standardizing agencies. Index.

Note In this book, established welding processes and related processes such as brazing, metal-spraying, and hard-facing are discussed from the metallurgical and production viewpoints. Processes are described for the benefit of engineers and metallurgists rather than welders; and subtopics, such as weldability and the effects of welding heat upon metal properties, are discussed in terms of metallurgical principles. However the book is not full-blown treatise on metallurgical aspects as the title implies. It is instead a well-written and useful account of welding in general, with emphasis on those aspects of the welding and related processes that are of most concern to graduate engineers. The author is Research Associate Professor of Metallurgical Engineering in the University of Illinois.

GREEN, ROBERT S , AND OTHERS, editors

Design for welding Editor, Robert S. Green, associate editors, Douglas C. Williams and Charles B Smith. Cleveland The James F Lincoln Arc Welding Foundation, 1948 1042 p illus. 22 cm $2 50 5992

Contents (abridged): The James F Lincoln Arc Welding Foundation—creation, objectives and activities. Section I, Aircraft: Arc welded assembly of the B-36 engine mount, by E. C. Casmedine. Section II, Automotive Design of an all welded bus body by H. C. Woods. Casting vs weld fabrication, by N. E. Wheeler. Section III, Railroad: Improvements in welding of Diesel electric locomotives, by R. H. Macy Low-alloy welded box cars, by Max Seel. Section IV Watercraft 67 ft. 0 in. commercial fishing dragger by E. Manhans Jr Section V Containers: Arc welded vacuum drying ovens, by C. H. J Cooley Container for the transportation of liquid chemicals, by A. F Meyer. Section VI, Furniture: Tele cabinet, by Victor Weidner Section VII, Structures: A five span all welded viaduct, by J. F Willis. A welded ore handling bridge, by R. E. Mumma. Arc welded steel column assemblies for coil forms and stucco houses, by A. Ban. Section VIII, Machinery A new type concrete mixer by J P Woods. Automatic forming, boring and drilling machine, by E. M. Barrett. Design and manufacture of welded centrifugal pump, by V E. Meyers. Fabricated gears, by R. F Fay Arc welded steam platens, by H. O. Lehman. An arc welded mining machine, by E. Schmierer. Section IX, Welding Index.

Note Each chapter in this book shows how a special problem in machine or equipment design was solved by the use of welding. Welding techniques applied in actual engineering structures and products are described by professional engineers. The book is of interest to design and production engineers.

HENRY, OTTO HAZELTON, AND G E CLAUSSEN

Welding metallurgy iron and steel, revised by G E Linnert. Second edition New York American Welding Society, 1949 505 p. illus. 20 cm. $3 00 5993

Contents. Metallurgy of welding. Types of steel and their manufacture. Welding methods and processes. Temperature changes in welding. The structure of metals. The mechanical properties of metals. Effects of alloying elements. Fluxes and slags. Simple welds in iron and steel. Shrinkage in welds. Preheating and postheat treatment. Difficulties and effects. Welding plain-carbon and low-alloy steels. Welding stainless and heat-resisting steels. Welding tests. Appendixes Metallurgical data. Questions and problems. Abbreviations and chemical symbols. Index.

Note A practical discussion for welders of the structure, properties, and composition of steels and other ferrous alloys. The material in the previous edition has been consolidated, rearranged, and amplified. A new chapter on welding tests has been included, and an index has been added. Other additions are the suggested reading given at the end of each chapter 60 new figures throughout the text, and new review questions. In accordance with general usage the Fahrenheit temperature scale has been substituted for the Centigrade.

JAMES F LINCOLN ARC WELDING FOUNDATION

Studies in arc welding design manufacture and construction. Cleveland, O The James F Lincoln Arc Welding Foundation 1943 1295 p illus 22 cm $2.50 5994

Content (abridged) Section I, Automotive Low-cost grading and hauling, by John F Dillon, Jr Universal joint drive shafts, by D. F ... by W W Knight. Arc welding in bus construction, by E. W Jacob Wagner. Wheel mounting for racing automobile, by G. J. Martinson and F F Vanew High-speed dirt movers, by ... economically Section II, Aircraft Welding aircraft engine mounts ... Erik K. by Peter F Rossmann. Aircraft propeller blade, by

June 27 1949 Philadelphia. American Society for Testing Materials, 1950 95 p. illus. 23 cm. (Special technical publication no. 96) $1.75. 6007

Contents: Introduction, by L. W. Ball. Recent progress in flash radiography, by J. C. Clark. [illegible] X-ray technique, by D. T. O'Connor and others. Radiography and autoradiography by [illegible], by D. T. O'Connor and W. R. Maddy. Modifying the [illegible] generator for [illegible] radiography, by R. A. Barrill. A [illegible] exposure calculator for [illegible] radiography and its application [illegible] radiographic films and techniques, by M. A. Kahn and others. A discussion of radiographic sensitivity, by C. H. Hastings. A [illegible] procedure for establishing radiographic standards, by L. W. Ball. An investigation of radiography in the range from 0.5 [illegible], by W. W. Buechner and others.

Note: A collection of reports on new developments in the application of X-rays to the observation of internal structures of engineering parts and to nondestructive testing techniques. Descriptions are given of the apparatus and methods used by the authors in their research work carried on at such points as the Naval Ordnance Laboratory and the Massachusetts Institute of Technology. Written for engineers, physicists, and manufacturers of engineering materials.

American Society for Testing Materials

Symposium on the rôle of non-destructive testing in the economics of production. Presented at the fifty-third annual meeting, American Society for Testing Materials Atlantic City N. J., June 27 1950. Philadelphia, American Society for Testing Materials, 1951. 157 p. illus. 23 cm. (Special technical publication no. 112) $2.50 6008

Contents: Introduction, by R. H. Lester. A basic guide for management's choice of non-destructive tests, by R. C. McMaster and S. A. Wenk. Discontinuities in cast and wrought products that can be revealed by non-destructive tests, by K. R. Van Horn. The rôle of non-destructive testing in the economics of castings, by J. W. [illegible]. The economics and practical applications of cobalt 60 in the radiographic inspection of steel weldments, by W. L. Schertz. The economics of wrought steel inspection, by C. D. Moriarty. Management responsibility for [illegible] on nondestructive testing [illegible] the development of new engineering products and processes, by L. W. Ball.

Note: The general purpose of this symposium was to acquaint [illegible] and management engineers with the value of non-destructive testing [illegible] improving the quality of manufactured products. Specific tests and their fields of application are described and discussed in each paper. However, the bulk of the material is contained [illegible] the first paper where the basic principles and features of 13 test methods are summarized. Included are [illegible] tabulation of 150 [illegible] methods and [illegible] bibliography of approximately 520 references.

American Society for Testing Materials

Symposium on ultrasonic testing, presented at the fifty-second annual meeting of the American Society for Testing Materials, Atlantic City N. J., June 28, 1949 Philadelphia. American Society for Testing Materials, 1951. 133 p. illus. 23 cm. Special technical publication no. 101) $2.00 6009

Contents: Introduction, by H. C. Arnsberg. Ultrasonic wave propagation in materials [illegible] guide to theoretical results, by L. Gold. Inspection, processing, and manufacturing control of metals by ultrasonic methods, by C. H. Hastings and S. W. Carter. Basic principles of pulsed ultrasonic testing, by J. C. Smack. Ultrasonics in the heavy forging industry, by J. C. Hartley. The application of ultrasonics to the inspection of aluminum, by J. V. Carroll. Ultrasonic testing in railroad work, by R. D. Hall. Ultrasonics in the electrical industry, by B. M. Lehman. Ultrasonic testing of bronze bearings and liners, by A. Finch. Pulse techniques applied to dynamic testing, by J. L. Locke. The measurement of dynamic modulus in adhesive joints at ultrasonic frequencies, by A. G. H. Dietz and others. General discussion.

Note. The technique of ultrasonic testing employs ultra high frequency sound [illegible] to detect internal or external flaws or foreign bodies in otherwise homogeneous masses. The papers and discussions in this technical publication present [illegible] summary of the history, theoretical aspects, basic principles of practical testing, and practical applications for the ultrasonic testing of materials. Ten of the papers [illegible] are presented at the meeting, and two at the 1950 annual A.S.T.M. meeting under the sponsorship of Committee E 7 on Non-Destructive Testing. The paper by Hastings and Carter is more extensive than the rest and contains [illegible] bibliography of 142 references, each reference being classified as to its general subject content.

Johnson Jack

Precision measurement methods and formulas. New York Pitman Publishing Corporation, 1948 181 p. illus. 24 cm. $3.50 6010

Contents (abridged): Checking taper. Measuring the angle between splines. Checking the angles of [illegible] tapered recess. Checking the included angle of [illegible] profile gage. Measuring the angle of [illegible] V groove. Checking the round clearance of [illegible] die. Measuring the angle of [illegible] cutter. Finding the radius of [illegible] circle segment. Finding the radius of [illegible] concave surface. Checking the amount of arc in [illegible] circular groove. Measuring the degrees of [illegible] cam lobe. Accurate layout method for index plates. Measuring the diameter of [illegible] recessed hole. Checking the [illegible] of [illegible] small concave surface. Checking an internal dovetail. Checking the [illegible] of [illegible] V groove with one wall perpendicular. Determining the best size of wire for checking threads. Helix-angle correction on three-wire measuring. Index.

Note: Fifty-seven relatively difficult inspection operations, such as are listed above, are considered in this book; and the equipment and procedure for carrying out each one are explicitly described. In each case, methods that require only standard instruments and simple accessories, such as balls, pins and discs, are shown. The measurements made [illegible] these simple tools must in most cases be supplemented by mathematical calculations. T[illegible] aid in these calculations the elements of trigonometry and square roots are reviewed in preliminary chapters.

Kennedy Clifford W

Inspection and gaging: a training manual and reference work. New York Industrial Press, 1951 502 p. illus. 24 cm. $9 00. 6011

Contents: The need and function of inspection. How specifications and the inspector. Tolerances and allowances. How standards aid the inspector. Basic principles and techniques of measurement. Fixed gages. Surface plate methods and equipment. Mechanical indicating equipment. Electrical and air indicating equipment. Optical measuring and inspection equipment. Gaging and inspection of screw threads. Special measuring and inspection problems. Gage checking and calibration. 100 per cent inspection. Quality control and sampling. Process inspection. Hints for making [illegible] good job better. Index.

Note: A clearly written introduction to the inspection procedures and instruments used in present-day precision manufacturing. For an introductory work it is unusually comprehensive. For example, the reader is told not only how to use gages but how to check their accuracy. However, subjects such as quality control are only outlined. The book is well illustrated. It can be recommended to anyone from vocational school student to factory executive [illegible] he is making his first acquaintance [illegible] inspection. It is well suited to home study.

Michelon Leno Ceno

Industrial inspection methods. Revised edition. New York Harper & Brothers, 1950. 566 p. illus. 24 cm. $6.00 6012

Contents (abridged): Section I, Basic concepts in industrial inspection. Section II, Dimensional control: Nonprecision measurement. Precision measurement: micrometers and verniers. Fixed, [illegible] and snap gages. Precision gage blocks. Comparison measurement: dial indicators and indicating gages. Precision angle measurement. Screw threads and thread gages. Comparators and automatic gaging. Optical instruments. Surface plates and inspection [illegible]. Statistical methods of quality control. Section III, Testing for physical and mechanical properties: Mechanical properties and destructive testing. Hardness testing. Industrial radiography. Section IV, Superficial inspection methods. Section [illegible] Inspection organization and personnel. Section VI, Appendix: Bibliography. Manufacturers' catalogs and technical bulletins. Tables. Index.

discussed. Allied processes, such as metal spraying and oxygen cutting, are also covered. The treatment is introductory and the book is particularly suited to the needs of such readers as engineering college students and graduate engineers who are interested in welding, metal cutting, etc., as fabrication processes. The author is Associate Professor of Mechanical Engineering in Georgia Institute of Technology

PRIEST, H MALCOLM

The practical design of welded steel structures New York American Welding Society, 1943 153 p illus. 20 cm. $1 00 6001

Contents Editorial note. Introduction. Welding processes. Welding rods and electrodes. Forms of joints. Gas cutting. Qualification and inspection. Codes and reports. Stress distributions and stress paths. Temperature effects. Design considerations. Symbols. Girders. Trusses. Columns. Beam connections. Continuous structures. Rigid frames. Fatigue. Conclusion. Bibliography

Note. A consideration of welding practice in the jointing of girders, trusses, columns, and beam connections. A reprint in book form of an article in *The Welding Journal* September 1943 with additions from the author's *Engineering essentials for welders* which appeared in the April 1943 issue of the same journal.

RIGSBY, HERBERT PRENTICE

Welding fundamentals. New York Pitman Publishing Corporation, 1948 178 p illus. 24 cm $4.25 6002

Contents Welding fundamentals History of welding—its place in industry Safe practices in welding. Arc welding equipment. Oxyacetylene welding equipment. Electrical-resistance welding equipment. Heliarc welding equipment. Atomic-hydrogen arc welding equipment. Welding gases. Welding rods and fluxes. Types of joints. Standard welding symbols. Metallography Weldability of metals. Testing of welds. Design for welding. Glossary of welding terms. Exercises in welding practice Practice lessons. Appendices Table of melting points. Iron-carbon equilibrium diagram. Bibliography Index.

Note The information presented in this work is intended for engineering students and engineers rather than for students who wish to make welding their vocation. Accordingly the instructions are general and theoretical, and aim to show how arc welding may best be used on engineering projects. Such topics as where arc-welding may be most profitably used what is the most easily welded steel main functions of electrode coating materials and the kinds of metals which are welded by the heliarc process are discussed. The chapter on tests is fairly complete and deals with the guide bend, free-bend, nick-break, tension radiograph, and other tests for welds.

ROSSI, BONIFACE E

Welding engineering New York McGraw Hill Book Company Inc 1954 786 p illus 24 cm $9 00 6003

Contents Processes A survey of the different welding processes and their basic principles Gas welding. The electric arc and its application to welding. Equipment and materials for bare and shielded metal-arc welding. Bare and shielded metal-arc welding. Submerged arc welding. Inert-gas-shielded arc welding. Atomic-hydrogen welding. Resistance welding Soft soldering, brazing and braze welding Oxygen and arc cutting of metals. Safe practices and health precautions in welding and cutting. Metals and their weldability Metallurgy of welding. Weldability of metals. Design and fabrication considerations Welded design and its field of applications. Designing for welding types of joints, welds, and stress distribution. Layer sequence, deposition rates, and welding costs. Expansion, contraction, and residual stresses in welding structures Welding jigs. Standard welding symbols and their uses. Testing and inspection Testing and inspection of welds. Appendices. Index.

Note An introductory but comprehensive survey of present-day welding techniques. Besides full descriptions of welding processes and tools, some information is included on designing of parts and structures for welding and on the inspection of welds. Also included is a wide range of reference information such as data on the weldability of metals, a glossary of welding terms, and an extensive classified bibliography Probably the book will be used most in school courses. However it includes much information that has reference value for vocational school graduates who are beginning practical work and for engineers and technicians who occasionally are in need of practical information on welding. The book is a development of a course taught by the author at the Industry Training School of the Stevens Institute of Technology

UDIN, HARRY, AND OTHERS

Welding for engineers. By Harry Udin, Edward R. Funk, and John Wulff. New York John Wiley & Sons, Inc., 1954 430 p. illus 23 cm. $7.50 6004

Contents The welding processes. Cold welding. Hot pressure welding. Resistance welding. Metallurgical reactions in resistance welding. Heat and temperature during fusion welding. Permanent-electrode arc-welding processes. Consumable-electrode processes. Welding with chemical heat sources. Metallurgy of fusion welding—transformations—weldability Braze welding. Metallurgy and mechanics of brazing. Thermodynamics and hydromechanics of brazing. Mechanical effects encountered in welding. Principles of weld inspection and testing. Glossary Problems. Index.

Note. An engineering college textbook developed at the Massachusetts Institute of Technology It is addressed primarily to students of mechanical engineering, both those who after graduation will be concerned with welding as a fabricating technique and those who will go on to do fundamental research in the field. It can be recommended also to graduate engineers who wish to acquire a broad fundamental knowledge of welding in home study The various welding processes, including the recently developed Koldweld process, are described very specifically and their potentialities and limitations are indicated. The physical and chemical principles that underlie them are explained, often in terms of atomic and molecular structure. The high points of related techniques, such as inspection of welded joints, are described. Occasional footnote references to papers of interest appear throughout the book.

UNITED STATES NAVY DEPARTMENT BUREAU OF SHIPS

Underwater cutting and welding manual Washington, D C Government Printing Office 1954 106 p. illus 26 cm. (Navships 250-692 9) $0 55 6005

Content Underwater cutting and welding. Safety in underwater cutting and welding. Arc-oxygen method of underwater cutting. Metal arc method of underwater cutting. Oxy-hydrogen method of underwater cutting. Underwater welding.

Note Much of the contents of this book is based upon experience gained by the Navy of the United States of America in ship-raising operations during and after World War II. An extensive development program in underwater cutting resulted in improved equipment, simplification and standardization of the operating techniques, and increased safety and efficiency of operation, all of which are embodied in the present manual, which supersedes previous Bureau of Ships publications entitled *Summary of recent advances in underwater cutting* and *Manual on underwater welding*.

THE WELDING ENCYCLOPEDIA, completely revised and re-edited by T B Jefferson. Originally compiled and edited by L. B Mackenzie Thirteenth edition New York The McGraw Hill Publishing Company, 1951 1008 p illus (part col d) 22 cm. $7.50 6006

Contents An encyclopedia of welding. Appendixes. A dictionary of trade names. The welding industry buyers' manual. Index.

Note A standard reference work of descriptions and discussions of welding equipment, materials, and techniques. In its original and revised forms the work has been in use by welders, engineers and students since 1921 and the twelfth edition as published in 1947 The format and scope of the book are the same in this edition, but about one-seventh of the text is revised or new Fifty pages are devoted to advertising.

TESTING AND INSPECTION

AMERICAN SOCIETY FOR TESTING MATERIALS

Papers on radiography Presented at the fifty second annual meeting, American Society for Testing Materials Atlantic City N J,

HEAT AND POWER ENGINEERING

GENERAL

ASSOCIATION FOR APPLIED SOLAR ENERGY

Applied solar energy research a directory of world activity and bibliography of significant literature. Edited by E. J. Burda. Stanford. Published and distributed by Stanford Research Institute for The Association for Applied Solar Energy 1955 298 p. 22 cm. ap. 6015

Contents: Part 1, World research activities: Research. Solar [illegible]. Part 2, Bibliography on solar energy utilization: Topical [illegible], Bibliography. List of journals and publications.

Note: The importance of developing, within the next few decades, practical methods of wide utilization of the sun's energy is [illegible]. One of the fruits of this recognition is the existence of the Association for Applied Solar Energy, sponsors of this [illegible] volume. Part [illegible] of the book lists both organizations and individuals who are [illegible] recently or currently engaged in research [illegible] solar energy utilization [illegible]. Although worldwide in scope, the part runs to only 40 pages. The second and much longer part [illegible] of an annotated international bibliography of journal articles and patents of interest in connection with the utilization of solar energy. A detailed topical index to this bibliography is included. A new edition [illegible] in progress.

AYRES, EUGENE AND CHARLES A. SCARLOTT

Energy sources—the wealth of the world. New York McGraw Hill Book Company Inc., 1952. 344 p. illus. 24 cm. $5.00 6016

Contents (abridged): Energy our priceless heritage. How much [illegible]. How much coal. How much of other fossil fuels. [illegible] of energy use. Waste. Life expectancy. The nucleus. Power from the sun. Windows. How much [illegible]. Rain. Wind and [illegible]. Energy balance sheet. Appendices. Bibliography. Index.

Note: A very readable study of the energy resources available [illegible] mankind. Discussions of coal, oil, and natural gas take up about half of the space, and the rest is devoted to such topics as [illegible] materials, direct use of solar energy, the use of vegetation [illegible], and the power in wind and waves. The authors come to the conclusion that mankind['s] energy needs will have to be met [illegible] than is generally supposed by the use of solar energy. They [illegible] that more research could well be done in this field. A wide range of data on fuel resources and other energy topics is included.

CABLE, J WESLEY

Induction and dielectric heating New York. Reinhold Publishing Corporation, 1954 576 p. illus. 24 cm. $12.50. 6017

Contents: Introduction—history and present status. Theory of induction heating. Sources of electrical energy for high-frequency induction heating. Elements of coil design. Metallurgical applications of induction heating. Brazing and welding by induction heating. [illegible] soldering by induction heating. Induction heating for forging. Induction melting. The importance of jigs and fixtures in induction heating. Machine design as applied to induction heating. Specialized applications of induction heating. Theory of dielectric heating. Sources of electrical energy for dielectric heating. Electrodes and accessory equipment for dielectric heating. General applications of dielectric heating. Dielectric heating in the plastics industry—in the woodworking field—for baking foundry cores—in the food-processing field—as applied to sterilization and allied processes—for moisture removal. Specialized applications of dielectric heating. Mechanization of dielectric heating applications. The future of dielectric heating. Addendum: Radio interference aspects of induction and dielectric heating equipment. Index.

Note: A comprehensive and rather detailed description of basic principles, equipment, techniques and applications. It is designed for wide use as [a] source of information on these two important methods of electrical heating, hence, even in the chapters on theory the treatment is descriptive rather than analytical. Both solidly established techniques and those which are still experimental or at least have not gained wide acceptance are described. Typical commercial equipment is described, but the author has not attempted to cover all of the apparatus on the market. The author's style is easy to read and can be understood by technicians and others who lack formal engineering education. There is no bibliography.

COMPRESSED AIR AND GAS INSTITUTE

Compressed air handbook a reference book on all phases of industrial air and gas compressors and compressed-air-powered portable tools and rock drills used by industry Second edition. New York McGraw Hill Book Company Inc. 1954 408 p. illus. 23 cm. $8.00. 6018

Contents (abridged): Typical applications of compressed air and gas. Air-operated portable tools and rock drills. The compressed-air system. Positive-displacement compressors. Dynamic-type blowers and compressors. Compressed-air engineering data and test procedure. Index.

Note: A standard reference book on compressed air equipment, its uses and maintenance. All varieties of equipment are covered from portable hand drills to large scale compressor plants. The full range of applications is described, but there is no attempt to catalog the equipment currently offered by manufacturers. Instead, the space is devoted to basic topics and data of interest to engineers who also have access to manufacturers' catalogs. The first edition was published in 1947 by the sponsoring Institute. This second edition contains [a] wide range of newly added information and many new illustrations.

CURTIS FRANK W

High-frequency induction heating. Second edition. New York McGraw Hill Book Company Inc., 1950 389 p. illus. 21 cm. $7.00 6019

Contents: Principles of induction heating. Induction-heating equipment. Design of induction-heating coils. Brazing, soldering, and joining. Hardening and heat-treatment. Fixtures for induction heating. Miscellaneous induction-heating applications. Designing for induction heating. Dielectric heating. Index.

Note: A survey of the applications of high-frequency induction heating in industrial processes. Though the chapter titles are essentially the same as in the first edition, the book has been thoroughly revised and now contains much material that did not appear in the original edition. A considerable part of this material relates to new fixtures and assemblies which have been developed as the applications of induction heating have been extended. However the chapter on dielectric heating is still essentially an outline of the subject and is not intended to be comparable in thoroughness to the

Note A practical introduction to modern inspection instruments and methods. The first edition proved to be very useful in training new recruits in war plants. This edition is largely new in content. The work now includes good accounts of all the instruments commonly used in factory inspection, of the chief testing methods, and a concise description of quality control from the inspector's viewpoint. It is organized as a textbook and undoubtedly its chief use will be in conjunction with organized courses in technical institutes and other schools. However it is suitable for the beginning worker and others who want to instruct themselves.

ST JOHN, ANCEL, AND HERBERT R. ISENBURGER

Industrial radiology X rays and gamma rays Second edition New York John Wiley & Sons, Inc , 1943 298 p illus 23 cm. $6 50 6013

Contents Introduction. The infancy of radiology The history of industrial radiology Nature and properties of X-rays. Influence of matter on X-rays. Influence of X-rays on matter Production, detection, and recording of X-rays. X-ray generators. An installation for industrial radiography Making a radiograph. Photographic procedure. Interpreting radiographs. Industrial fluoroscopy Radiography of large castings and forgings. Radiography of welded vessels and structures. Radiography of small objects. Some interesting examples. Radiography with gamma rays. Radiographic specifications and inspectors. Operating and cost data. Looking ahead. Appendices. Radiographic rules. Tables. Charts. Bibliography Index.

Note. This book discusses the examination, by means of X-rays and gamma-rays, of castings, forgings, welded joints, packaged materials, assemblies such as vacuum tubes and other industrial products. The subject matter is practical and intended for use by engineers.

SWEENEY, R. J

Measurement techniques in mechanical engineering New York John Wiley & Sons, Inc., 1953 309 p illus 24 cm. $6 00. 6014

Contents Introduction. Mensuration. Mass. Time and speed. Electrical measurements. Dynamometers. Pressure. Temperature. Fluid flow Calorimetry Chemical analysis. Automatic controls. Appendix. Index.

Note. A well-organized and clearly written survey of instruments and techniques used in measuring such properties as length, area, time, speed, pressure, temperature and hydrogen ion concentration. It is designed for mechanical engineers who are concerned with the performance testing of power equipment. A wide range of instruments is covered, including such unexpected ones as micrometers, platform scales, clocks, and valves for controlling the flow of fluids. Descriptions of the instruments and of the measurement techniques based on them are preceded by a useful discussion of various factors that affect the accuracy of measurements.

For a practical text and reference book of approved methods of using engines, turbines, boilers, and auxiliary equipment found [illegible]

Putnam, Palmer Cosslett

Energy in the future. Princeton D Van Nostrand Company Inc., 1953 556 p. illus. 24 cm. $15.00. 6025

Contents (abridged): Is population growth predictable—the [illegible]. Maximum possible populations to [illegible], A.D. 1950 to 2050. Energy-output relations in the eight great [illegible] energy systems and in the world, A.D. 1860 to 1950, with [illegible] of the efficiency of use. Maximum plausible demands for energy, A.D. 1950 to 2050. How much longer can we live high off [illegible] energy? Can we live high off income energy? The maximum [illegible] of income fuels. Summary. Epilogue and conclusions. [illegible]. Table of conversion factors. Bibliography. Index.

Note: This book [illegible] the report of [illegible] painstaking study of the [illegible] possible use that nuclear fuels may be called on to [illegible] the next fifty years or so. It estimates the non-nuclear [illegible] of energy available to the world, including such largely [illegible] sources as wind power and solar energy, and the energy requirements of the world in the immediate future. By [illegible] the gap between the energy needs of the world and the energy available from the non-nuclear sources will have to be [illegible] by nuclear energy. Among the author's conclusions, "It does not seem likely that the forms of uranium or thorium could [illegible] more than 15 to 20 per cent of the energy systems of the world from [illegible] as at present. The figures for the [illegible] would [illegible] be higher. The possibility of [illegible] has been not yet considered.

Putnam, Palmer Cosslett

Power from the wind. New York D Van Nostrand Company Inc., 1948. 224 p. illus. 24 cm. $3.00. 6026

Contents: Formulation and history of the Smith-Putnam wind-turbine project, 1934-1945. How does wind behave—[illegible] [illegible]. The special wind-research program, 1940-1945. Behavior of wind in the mountains of New England, 1940-1945. The power in the wind and how to find it. Designs of other big windmills, 1922-1935. Development, fabrication, and erection of the test unit, 1939-1941. Test and operation of the Smith-Putnam [illegible], 1941-1945. The [illegible] for [illegible] large wind-turbines. The design of [illegible] preproduction model, 1943-1945. Economics of [illegible] windpower. Ways to reduce the cost of windpower. The future of windpower. Bibliography. Index.

[illegible] in the main, this volume is [illegible] record of the experiments [illegible] wind power to generate electrical energy on [illegible] commercial [illegible] that were carried out from 1939 to 1945 by [illegible] distinguished [illegible] of engineers and scientists under the sponsorship of the S. Morgan Smith Company, York, Pennsylvania. It describes from an engineering viewpoint both the design and the performance of the [illegible], 1,250 kilowatt unit that was erected on Grandpa's Knob [illegible] Rutland, Vermont. However, the work goes beyond this single [illegible] and discusses the whole problem of utilizing wind as [illegible] of power. A good account is given of other experiments carried out by other individuals and groups.

Zerban, Alexander H., and Edwin P Nye

Power plants. Second edition. Scranton, Pa. International Textbook Company 1956. [illegible]55 p. illus. 23 cm. $8.50. 6027

Contents: An introduction. The steam power plant cycle. Fuels. Combustion. Steady state heat transfer. Furnace heat transfer. Steam generators. Steam power turbines. Fluid handling. Instruments and [illegible]. Care of heat transfer surfaces. Hydraulic power plants. I.C. power plants. Power plant economics. Problems and possibilities. Appendices. Index.

Note: A book designed primarily for use as a text for upperclass [illegible] students of mechanical or electrical engineering. It provides [illegible] introduction to the mechanical engineering aspects of power generation at the present time. The first edition was limited [illegible] steam plants and was entitled Steam power plants. In this edition, [illegible] four years after the first, the scope has been enlarged by inclusion of chapters on hydraulic power plants, power plant economics, and the problems and possibilities of large-scale power generation. The last mentioned chapter is [illegible] stimulating discussion of the needs for power in the United States of America in the near future and of new methods to meet these needs, such as solar energy and atomic energy. The book is concisely but clearly written and adequately illustrated. It still retains the chapters on the building and maintenance of steam boilers that were [illegible] special feature of the first edition.

Zimmerman, Oswald Theodore, and Irvin Lavine

Industrial Research Service's psychrometric tables and charts. Dover N. H. Industrial Research Service 1945 162 p. illus. 22 cm. $7.50 6028

Note: Data on the properties of dry air and air-water vapor mixtures under [illegible] pressure of 29.921 inches of mercury are presented in 33 tables and 22 charts. The range of temperatures is —100 to 1000° F. Most of the data represent original calculations by the authors. In addition to the tables and charts, there are [illegible] short preliminary chapter on the fundamental principles and formulas pertaining to the behavior of air and air-water vapor mixtures, and another chapter of problems designed to illustrate the use of the tables and charts.

APPLIED THERMODYNAMICS

Brown, Aubrey I., and Salvatore M Marco

Introduction to heat transfer. Second edition. New York McGraw Hill Book Company Inc., 1951 267 p. illus. 24 cm. $6.75 6029

Contents: Modes of heat transfer. Heat transfer by conduction. Equations for the calculation of heat transfer by conduction (steady state). Radiation. Introduction to the study of convection. Forced convection. Free or natural convection. Heat transfer to boiling liquids. Condensing vapors. Over-all transfer of heat. Application of the principles of heat transfer to design problems. Variable heat flow. Appendix. Index.

Note: An established textbook the first edition of which was published in 1942. It is used primarily in introductory courses in heat transfer offered to engineering college students. Emphasis is placed on acquiring [illegible] clear conception of the manner in which heat is transmitted and on development of the fundamental mathematical expressions used in heat transfer calculations. In this second edition, the organization and level of the book are unchanged from the first edition, but important changes including the rewriting of some sections and the addition of information to others have been made in several chapters. Also the problems included for students to solve have been revised and much increased in number.

Croft, Terrell Williams

Practical heat. Revised by R. B. Purdy. Second edition. New York McGraw Hill Book Company Inc., 1939 726 p. illus. 21 cm. (Power plant series) $8.00. 6030

Contents: Force, pressure, work, energy, power. Matter, heat, temperature. The source of heat. Heat—its measurement and transformations. Transfer of heat. Effects of heat. Expansion and contraction of solids and liquids. Heat phenomena of gases. Melting and freezing of substances. Vaporization. Steam and other vapors. Gas and vapor cycles. Fuels. Combustion. Steam power plants. Internal-combustion-engine power plants. Refrigerating. Ventilating. [illegible]. Instruments. Solutions for problems. Index.

Note: This text is intended for the practical student of limited mathematical training and stresses the practical applications of heat. Fundamental theory, such as the laws of thermodynamics, the heat-transfer equations, the laws of gases, the Carnot cycle, and coefficients of expansion, is expounded in [illegible] simple manner that requires only [illegible] working knowledge of arithmetic for its understanding. The work is well adapted for self-study.

rest of the book. The book is of wide practical interest in manufacturing industries.

DANIELS, FARRINGTON, AND JOHN A. DUFFIE, editors

Solar energy research. Madison University of Wisconsin Press, 1955 290 p illus. 24 cm $4 00 6020

Contents Introduction by F Daniels. Expected world energy demands Maximum plausible demands for energy in the future, by P C. Putnam. The nature and availability of solar energy: Meteorology and the utilization of solar energy by W A. Baum. Notes on spectral quality and measurement of solar radiation, by F A. Brooks. Space heating and domestic uses of solar energy: House heating and cooling with solar energy by G. O. G. Löf. Solar heating design problems, by L. B. Anderson and others. Solar heat storage, by M Telkes. Applications of solar energy for heating, air conditioning, and cooking, by M L. Ghai. The heat pump, by R. A. Morgen. Use of solar energy for heating water by F A. Brooks. Solar power Small solar power plants, by M. L. Ghai. Power generation with solar energy by H. C. Hottel. Solar power from collecting mirrors, by C. G Abbot. Notes on solar power and other uses of solar energy by E. J Drake. Solar evaporation and distillation: Solar distillation, by E. D Howe. *Distillation* with solar energy by M. Telkes. Solar evaporation of salt brines in open pans, by K. S. Spiegler Solar distillation of sea water in plastic tubes, by J T Herisby and F Daniels. Atmospheric phenomena, and conversion of solar to electrical energy Utilization of solar energy in some geophysical processes, by O. R. Wulf Maximum plausible energy contributions from wind power by P C. Putnam. Solar thermoelectric generators, by M. Telkes. Maximum efficiency of solar energy conversion by quantum processes, by D Trivich and P A. Flinn. Photovoltaic cells in solar energy conversion, by D Trivich and others. Solar furnaces Utilization of solar energy for the attainment of high temperatures, by J Farber Solar furnaces for attaining high temperatures, by W M. Conn. Development of large-scale solar furnaces, by F Trombe. *Photosynthetic* utilization of solar energy Efficiency of photosynthesis, by F Daniels. Biological cycles in the transformation of solar energy into useful fuels, by R. L. Meier Economic aspects of algae as potential fuel, by A. W Fisher Jr Photochemical utilization of solar energy Photochemical utilization of light energy by E. Rabinowitch. Photochemistry of cerium perchlorates in dilute aqueous perchloric acid, by L. J Heidt. High-energy *intermediates* in some photochemical processes, by H. Linschitz. A British viewpoint Solar energy applications, by H. Heywood. Miscellaneous applications of solar energy and suggestions *for further* research: Conversion of agricultural products to power by F Daniels. Storage of intermittent power by F Daniels. Seasoning of timber with solar energy by M. L. Ghai. Storage of solar energy in the ground, by F A. Brooks. Some ideas on solar energy utilization, by L. M. K. Boelter Conclusions, by F Daniels. Appendix A survey of United States patents pertaining to utilization of solar energy by J A. Duffie. Bibliography Index.

Note Although the origin of this book was symposium held in Madison, Wisconsin in September 1955 the published volume is not the usual formal record of proceedings. The contributions published in it range all the way from informal notes to formal papers of considerable length. Included also are several contributions by scientists who did not attend the meeting and hose papers are not presented there. Research done and in progress is surveyed and many ideas on promising lines of investigation are presented. Both the survey of United States patents on devices for the utilization of solar energy and the 14-page bibliography are useful features.

GILL, THOMAS T

Air and gas compression New York John Wiley & Sons, Inc. 1941 181 p illus. 23 cm $5 50 6021

Contents Definitions and fundamental units. Barometric pressure and altitude above sea level. Fundamental gas laws. Energy relations—single-stage compression. Compressor capacity Volumetric efficiency and clearance. Indicated horsepower Two-stage compression Multistage compression. Exponent of compression. Volumetric efficiency and compressor brak horsepower Compressor problems. Supercompressibility or deviation from the ideal gas laws. Compressors. Compressor plant. Gas lift and pressure maintenance. Flow of gas in pipe lines. Gas measurement by orifice meter. Use of alignment charts Appendix Index.

Note. A great deal of original research went into the preparation of this book, and much of the material appears here in book form for the first time. In addition to the theory of compression, there is also offered a chapter on the flow of gas in pipe lines, which is based on the Weymouth equation. A new series of tables is included which greatly reduces the labor required in computing pressure drop in pipe lines. The solution of problems is based on equations, tables, and alignment charts—an arrangement which will enable the reader to check nearly all computations in seven different ways.

HALL, JAMES DOYLE

Industrial applications of infrared. New York McGraw Hill Book Company, Inc. 1947 201 p illus. 23 cm. $3 50 6022

Contents. Introduction. Advantages of infrared heat. The incandescent lamp as source of infrared radiation. Radiant-heat equipment. Planning and design of infrared installation. Special application problems. Paints and other surface finishes. Industrial applications. Miscellaneous uses of infrared radiation. Appendix. Index.

Note Except for the introductory chapter, this volume is concerned entirely with the practical applications of infrared heat. The text is mainly descriptive. Approximately half the book consists of photographs and accompanying explanatory texts, which illustrate industrial and miscellaneous applications and equipment. The author is Advisory Engineer for the Lamp Division, Westinghouse Electric Corporation.

LEONARD, CARROLL M, AND VLADIMIR L MALEEV

Heat power fundamentals. New York Pitman Publishing Corporation, 1956 527 p illus. 23 cm $7.50 6023

Contents. The vapor power-plant cycle. Fundamentals. Steam Prime movers—the steam engine—the steam turbine. Heat transfer. Heat removal—condensing equipment. Water conditioning—heating—pumping. Steam generation—boilers and superheaters. Fuels and combustion. Heat generation—furnaces and fuel-burning equipment—draft and draft equipment. Vapor cycles. The internal combustion engine power plant. Gas-turbine power plants. Mechanical refrigeration. Appendixes. Index.

Note. An established engineering college textbook used in introductory courses in heat-power engineering. It combines elementary basic theory with descriptions of prime movers and power plant equipment, including techniques and devices for the treatment of feedwater Basic computations are illustrated, but the book is by no means an analytical treatment from the thermodynamic viewpoint. The first edition was published in 1949. In this edition, the book has been printed from new type and has new and more attractive format. The quality of the illustrations is markedly improved. There has been considerable reorganization and revision of the text. Discussions of results by new developments such as superpressure power plants, and atomic power plants, have been added.

MOYER, JAMES AMBROSE

Power plant testing a manual of testing steam generating equipment, engines, turbines, pumps, refrigerating machinery fans, fuels lubricants etc. Fourth edition, rewritten enlarged New York McGraw Hill Book Company Inc. 1934 614 p. illus. 23 cm. $7.50 6024

Contents. Measurement of pressure Measurement of temperature. Determination of the moisture in steam. Measurement of areas. Engine indicators, reducing motions, and speed-measuring instruments. Measurement of power—dynamometers. Flow of fluids. Calorific value of fuels—solid, liquid, and gas. Flue-gas analysis. A.S.M.E. code on general instructions regarding power plant tests. Testing of boilers and other steam-generating units. Steam-engine testing. Testing steam turbines and turbogenerators. Methods of correcting steam-turbine and engine tests to standard conditions. Tests of complete steam power plants—coal fired. Gas and oil engine and producer testing. Testing of ventilating fans or blowers and air compressors. Testing of refrigeration plants. Testing of condensers and feed-water heaters. Testing atmospheric water-cooling equipment—cooling towers, spray-nozzle installations and cooling ponds. Tests of hoists, belts, and friction wheels. Testing of lubricants. Tests of hydraulic machinery Testing of governors. Outline of suggested tests. Appendix. Steam tables. Properties of common substances. Metric conversion table. Pressure equivalents. Index.

[illegible]ty of Michigan. Engineering Research Institute. Special publications—Symposia) $5.00. 6037

Contents: Conference in heat transfer problems which create high thermal stress, by A. S. Freud[illegible]. Behavior of materials under conditions of thermal stress, by S. S. Manson. Liquid-metal heat transfer, by R. F. Poppendiek. Heat transfer with evaporation, by [illegible] E. R. [illegible]. Recent developments in convective heat transfer with special reference to high-temperature combustion chambers, M. [illegible]. Convective heat transfer at high velocities, by E. R. [illegible]. Transpiration and film cooling, by E. R. G. Eckert. Heat transfer from nonisothermal surfaces, by M. Tribus and [illegible]. Theoretical considerations in rarefied-gas dynamics, by [illegible]. Experimental methods and results in rarefied-gas dynamics, by S. A. Schaaf. Computation of temperatures in solid bodies and their [illegible], by R. V. Churchill.

Note: The purpose of the symposium mentioned in the title of the book was to inform faculty, graduate students, and attending engineers from industry about some of the then recent advances in heat transfer. The papers presented are published in this volume together with literature references and illustrative matter. Many of the developments covered are related to high-speed aerodynamics, rocket development, and nuclear reactor engineering. The authors of the papers are specialists, and many of them had taken part in the research which they described.

HUTCHINSON, FRANCIS WILLIAM

Industrial heat transfer. New York, Industrial Press, 1952. 326 p. 24 cm. $6.00. 6038

Contents (abridged): Conduction. Radiation. Convection. Combined heat transfer. Forced convection. Appendix. Bibliography. Index to graphs. Subject index.

Note: The heart of this work is a series of graphs—123 in number—that provide direct solutions for a wide variety of problems in heat transfer. The make-up of the book places each graph on a right-hand page with explanatory matter on the facing left-hand page. The matter includes the title of the chart, the equation on which it is based, reference to the section of the text where the relationships expressed by the equation are discussed, a statement of assumed conditions, an example problem and its solution. A useful reference book for chemical engineers and others whose work includes heat transfer computations.

JAKOB, MAX

Heat transfer. Volume I. New York, John Wiley & Sons, Inc., 1949. 758 p. illus. 24 cm. $13.50. 6039

Contents (abridged): The basic equation of heat conduction. The basic equations of heat convection. The basic equations of heat radiation. Theory. Thermal conductivity. Emissivity (absorptivity). Heat conduction in steady state without heat gains or losses. Heat conduction in steady state, including internal heat generation. Heat conduction in non-periodic temperature changes without heat losses or gains. Heat conduction in periodic temperature changes without heat losses or gains. Heat conduction at variable temperature, including internal heat generation and heat dissipation to the environment. Special mathematical methods used in heat conduction. Numerical methods for the solution of heat-conduction problems. Graphical methods for the solution of heat-conduction problems. Experimental analogy methods for the solution of heat-conduction problems. Analytical solutions of the convection equations. Similarity theory for heat convection. Experiments on free convection and their correlation. Experiments on forced convection and their correlation. Optical methods of determining heat transfer by convection. Analogy between heat convection and mass exchange. Heat transfer in evaporation. Heat transfer in condensation. Appendices: Problems. Nomenclature. Conversion factors. Bibliography and author index. Subject index.

Note: The first volume published of a treatise of considerable dimensions. The treatment is historical in the sense that the development of each important step in the understanding of heat transfer phenomena is traced back to its origin, but the account is brought down to the present time, and the final effect is a statement of heat transfer knowledge as it exists today. The physical properties of matter which influence heat transfer are emphasized, and important experiments and useful experimental techniques are described in detail. The space is about evenly divided between the presentation of empirical knowledge and mathematical analyses. However, the author has avoided very advanced mathematical techniques, hence, the work is not beyond the level of advanced engineering students and graduate engineers. The bibliography although extensive is not well organized. Volume II was published in 1957. $15.00.

JAKOB, MAX, AND GEORGE A. HAWKINS

Elements of heat transfer and insulation. Second edition. New York, John Wiley & Sons, Inc., 1950. 230 p. illus. 23 cm. $5.00. 6040

Contents (abridged): Conduction of heat in the steady state. Conduction of heat in the unsteady state. Steady-state heat conduction in bodies with heat sources. Introduction to the dimensional analysis of convection. Heat transfer by free convection. Heat transfer by forced convection. Heat transfer in condensing and boiling. Experimental determination of conductivities and emissivities. Heat transfer in temperature measurements. Heat transfer and fluid friction. Index.

Note: An introductory textbook designed for use in undergraduate courses in engineering colleges. Technically trained persons who are out of college sometimes find it useful as an introduction or refresher because of its elementary discussions. Although still intended for undergraduate use, a few advanced topics have been added in this edition, and the level of difficulty of the problems has been raised somewhat.

KERN, DONALD QUENTIN

Process heat transfer. New York, McGraw-Hill Book Company, Inc., 1950. 870 p. illus. 24 cm. $13.50. 6041

Contents (abridged): Process heat transfer. Conduction. Convection. Radiation. Temperature. Counterflow—double-pipe exchangers. 1-2 parallel-counterflow—Shell-and-tube exchangers. Flow arrangements for increased heat recovery. Gases. Streamline flow and free convection. Calculations for process conditions. Condensation of single vapors. Condensation of mixed vapors. Evaporation. Extended surfaces. Direct-contact transfer—cooling towers. Batch and unsteady state processes. Furnace calculations. The control of temperature and related process variables. Appendix of calculation data. Author index. Subject index.

Note: An advanced engineering college textbook in which practical problems in heat transfer are directly related to industrial processes and industrial heat transfer apparatus. Though the fundamentals of thermodynamics are never lost sight of, the valuable and unique parts of the book are those which are devoted to discussions and calculations pertaining to such apparatus as shell-and-tube heat exchangers and to such processes as the heating or cooling of batches of materials. These "apparatus calculations" are brought out in a special index preceding the text. The book will be valuable not only to chemical engineers but to all engineers in industry who are concerned with heat transfer problems.

KIEFER, PAUL J., AND OTHERS

Principles of engineering thermodynamics. Second edition. New York, John Wiley & Sons, Inc., 1954. 539 p. illus. 23 cm. $7.75. 6042

Contents: Part I, Energy—its classification and accounting: Energy in transition. Stored energy. Energy equations. Part II, The availability of energy: Reversible processes and cycles. The Carnot principle. The absolute temperature scale. Entropy. Part III, Properties of fluids: Properties and property relations—Solid, liquid, and vapor states—Ideal gases. Property and property relations—low-pressure gas and gas-vapor mixtures. Thermodynamic properties—non-ideal gases and vapors. Thermodynamics of combustion. Part IV, Engineering applications: Power-generation cycles—Condensing fluids—Non-condensing fluids. Heat-pump and refrigeration cycles. Flow of compressible fluids. Dynamic forces. Index.

Note: A successful textbook developed at the United States Naval Post-Graduate School. Although organized so that it may be used in undergraduate courses by omitting certain portions, the level of treatment can properly be described as first-year graduate. Fundamental aspects are definitely emphasized and are given the larger share of the space, but practical applications in the design of power plants and other machines based on thermodynamic principles are also treated rather thoroughly. The first edition was published in 1930. Changes made in preparing this second edition are both extensive and important. They include the chapters on nonideal gases and vapors, thermodynamics of combustion, the heat pump and flow of compressible fluids, all of which are new additions to the book.

DOOLITTLE, JESSE SEYMOUR, AND ALEXANDER HAMILTON ZERBAN

Engineering thermodynamics, theory and applications. Second edition Scranton, Pa. International Textbook Company, 1954 494 p illus 23 cm. $8 00 6031

Contents: Introduction. Equations of state for perfect gases. Energy equations for non-flow processes. Steady flow Carnot cycle, available energy and entropy Vapors. Steam power cycles. Steam engines. Flow in nozzles. Steam turbines. Gas compressors. Refrigeration. Gaseous mixtures and combustion. Imperfect gases. Air conditioning. Gas cycles. Internal combustion engines. Gas turbines. Steady state heat transfer. Problems. Appendices. Index.

Note: Good organization and lucidity of style characterize this engineering college textbook. The greater part of the space is devoted to basic principles and phenomena, but important applications are described in sufficient detail for beginning students. The first edition was published in 1948. The chapter on steady state heat transfer is new in this second edition, the problems have been moved to a new section at the end of the book and their number has been increased, and other changes of pedagogical interest have been made.

ECKERT, ERNST R. G

Introduction to the transfer of heat and mass With an appendix on property values by Robert M. Drake, jr New York Mc Graw Hill Book Company, Inc., 1950 284 p illus 23 cm. $6 50 6032

Contents Fundamental principles of heat transfer. Heat conduction. Heat transfer by convection Basic conceptions of the flow theory Forced convection in laminar flow Forced convection in turbulent flow Free convection. Condensation and evaporation. Thermal radiation. The exchange of mass. Appendix. Index.

Note In this relatively brief treatise the reader is shown how to obtain mathematical solutions to complex problems in heat transfer which will check with the results of empirical observations. Prandtl's boundary-layer theory is the basis of most of the work. In the final chapter transferrals of mass such as occur when moist material is dried by a moving stream of air are shown to be boundary-layer phenomena analogous to the transfer of heat. The book is of interest in many branches of engineering where fairly precise calculations of heating and cooling are essential.

ELLENWOOD, FRANK OAKES, AND CHARLES O MACKEY

Thermodynamic charts, steam, water, ammonia, "Freon 12", and mixtures of air and water vapor, also special tables for turbine calculations Second edition. New York John Wiley & Sons, Inc., 1944 46 p. illus. 21 cm. $4 75 6033

Contents Note regarding enthalpy Index chart for steam. Steam charts. Water charts. Low-quality steam chart. Ammonia charts. "Freon-12" charts. Psychrometric charts. Examples of the use of the charts. Tables I, II, and III, corrections of barometric readings. Table IV jet velocity from an ideal nozzle for each BTU Table v jet velocity from an ideal nozzle for each tenth of BTU Table VI, squares of numbers. Table VII, common logarithms.

Note This book comprises charts on steam, water ammonia, "Freon-12" and mixtures of air and water vapor also special tables for turbine calculations. In the second edition, plates 8 and 9 have been redrawn in order to include the pressure scale for the saturated liquid. For the ammonia and "Freon" charts scales to give the specific volumes for the saturated liquids have been added. An entirely new form of chart, plate 10, has been made for steam and water mixtures having qualities less than 80 per cent. Values for qualities above 80 per cent may be found from the original charts. In plate 10, the coordinates are quality as abscissa with saturation pressure and temperature as ordinates. This arrangement enables the entire area of the chart to be effectively utilized and the values of enthalpy entropy pressure, temperature, and volume for low qualities may be easily read. For all these properties this chart permits linear interpolation to be correctly used for any constant pressure or constant temperature line. The previous edition was entitled *Vapor charts.*

FAIRES, VIRGIL MORING

Applied thermodynamics. Revised edition New York The Macmillan Company 1947 480 p. illus. 24 cm. (Engineering science series, Earle Raymond Hedrick editor) 6034

Contents: The general energy equation. Characteristic equation of a perfect gas. Energy equations of a perfect gas. Reversible non-flow processes of gases. The Carnot and Ericsson cycles. Entropy and the second law of thermodynamics. Cycles for internal combustion engines. Performance of internal combustion engines. Compression and expansion of air Flow of gases. Mixtures of gases. Combustion and the products of combustion. Variable specific heats. Liquids and vapors. Processes of vapors. The steam power plant and auxiliary apparatus. Vapor cycles. Reciprocating steam engines. Modern cycles for steam power plants. Flow of steam in nozzles and turbines. Refrigeration. Mixtures of vapors and gases. The transfer of heat. Index.

Note: This standard text, designed for full-length college courses, provides an introduction to the basic theories of thermodynamics, and discussions of typical applications in engineering. This edition has been revised and enlarged to include an expanded discussion of the second law of thermodynamics and heat transfer, new material on the gas turbine, and extra illustrations. A third edition entitled *Thermodynamics*, was published in 1957 543 p., $7.50. The author's *Elementary thermodynamics*, third edition, New York, The Macmillan Company intended for use in short courses in thermodynamics, 1957 379 p., $4.75.

FAIRES, VIRGIL MORING

Theory and practice of heat engines. Ne York The Macmillan Company 1948. 388 illus. 24 cm $6 00 603

Contents. Characteristic equation of perfect gas. Forms energy Heat, work, and internal energy Thermodynamic process Compressors. Internal combustion engines. The second law of therm dynamics. Liquids and vapors. Steam turbines. Nozzles. Reciproca ing steam engines. Steam generators. Miscellaneous steam pow plant equipment. Fuels and combustion. Refrigeration. Index.

Note A concise exposition that is particularly designed f courses offered to engineering students who do not plan to ta additional courses in the subject. The major machines are describ and illustrated, but the author's method is to emphasize the teach ing of theory particularly the law of conservation of energy Th book contains many extracts from the author's well-known *Appli thermodynamics* (see above)

HAWKINS, GEORGE ANDREW

Thermodynamics Second edition. New York John Wiley & Sons Inc., 1951 563 p. illus 22 cm $7 00 6036

Contents. Fundamental concepts. The first law of thermodynamics. Solids, liquids, and gases. The ideal or perfect gas. Equations of state for real gases. Specific heat of gases. The use of tables for computing the properties of vapors. Frictionless or reversible non-flow ideal gas and vapor changes. The second law of thermodynamics and the Carnot cycle. Available energy, unavailable energy, and entropy Entropy changes for reversible ideal gas and vapor processes. Mixtures of ideal gases and vapors. Combustion. The flow of gases and vapors through nozzles and orifices. Ideal cycles of internal combustion engines. Air compressors and air engines. The gas turbine and jet propulsion. Vapor cycles. Mechanical refrigeration. General thermodynamic equations. Introduction to heat transfer. Appendix. Index.

Note: An introductory textbook for students in engineering colleges. While the chapter arrangement and general approach remain the same as in the first edition, the new edition has been revised by the author and considerably enlarged. Six of the chapters have been completely rewritten. Many minor changes have been made in other chapters, and additions have been made to the lists of references.

HEAT TRANSFER A SYMPOSIUM HELD AT THE UNIVERSITY OF MICHIGAN DURING THE SUMMER OF 1952 Ann Arbor University of Michigan, 1953 286 p. illus. 24 cm. (Univer

ment. Transient numerical method. Experimental analogic method. Appendix. Comparison tables. Index.

Note: A graduate-level text, authored by a member of the Department of Mechanical Engineering at the University of Minnesota. Its subject is the analysis of temperature fields, when solid bodies [illegible] of study which is of fundamental importance in most of the major fields of engineering. Analytical, graphical, numerical and experimental methods of studying the predicting these temperature fields are covered. The treatment is thorough from the engineering point of view but not always mathematically rigorous. Readers are expected to be familiar with calculus and differential equations. Selected literature references are included in most of the chapters.

SHORT BYRON E., AND OTHERS
Engineering thermodynamics. By Byron E. Short, Harry L. Kent, Jr and Burnette F Treat. New York. Harper & Brothers, 1953 452 p. illus. 24 cm. $6.00. 6050

Contents: Fundamentals. Energy transformation principles. Thermodynamic properties and processes for pure substances—of liquids and vapors. Properties and processes of ideal gases. Mixtures of fluids. The flow of substances. Combustion. Heat transmission. Gas analysis. Compression of gases and vapors. Internal combustion engines. The gas turbine. Vapor cycles. Steam or vapor turbines. Refrigeration and air cooling. Index.

Note: A well-organized textbook, designed for use in first courses in engineering thermodynamics offered to engineering college students. It presents a broad view of the field, with a good correlation of theory and applications to heat-power machines. The expository matter includes numerous worked examples of problems. When the book was published, the authors were all members of the faculty of the University of Texas.

SKROTZKI, BERNHARDT G A. AND WILLIAM A. VOPAT
Applied energy conversion a text in power plant engineering. New York McGraw Hill Book Company Inc., 1945 509 p. illus. 23 cm. $3.00. 6051

Contents: Raw energy. Steam power plant—combustion theory and equipment. Steam power plant—steam-generating units. Steam power plant—prime movers. Steam power plant—condensers and feedwater systems. Steam power plant—application. Diesel- and gas-engine plants. Hydraulic power plants. Power plant development. The general economic problem. Load curves. Selection of plant. System performance and operation characteristics. Specific [illegible] energy problems. Energy rates. Appendix. Index.

Note: This [illegible] places more emphasis on the economic aspects of power plant design and operation than is common in textbooks written for engineering college students. The coordination of equipment for the most economic production of useful energy is stressed. Types of plant and equipment are well described. Some types still in the developmental stage are discussed.

SOLBERG, HARRY LELAND AND OTHERS
Elementary heat power By Harry L. Solberg, Orville C. Cromer and Albert R. Spalding. Second edition. New York John Wiley & Sons, Inc., 1952 624 p. illus. 24 cm. $6.50 6052

Contents: Matter and energy. Fuels and combustion. Internal-combustion engines. Fuel-burning equipment. Steam generation. Steam power-plant cycles. Steam turbines. Steam engines. Pumps, fans, blowers, and compressors. Feed-water heaters and condensers. The gas-turbine power plant. Mechanical refrigeration. Appendix. Index.

Note: An introductory textbook written so that it may be used both by college students who will take no further work in the subject and by students of mechanical engineering who will pursue advanced courses. It covers both the fundamental theory and the operating principles of the chief heat power devices. The first edition appeared in 1946 and was an outgrowth of wartime needs. The increased length of the present edition is due both to added discussions of such devices as the heat pump and to an expansion of the theoretical material. The authors are members of the faculty of Purdue University.

STOEVER HERMAN JULIUS
Engineering thermodynamics. New York John Wiley & Sons, Inc., 1951 458 p illus. 24 cm. $6.00 6053

Contents: Part I, The first law of thermodynamics: Pressure, specific volume, and temperature. Mechanical work and heat. The first law of thermodynamics. The internal energy and enthalpy of fluids. The analysis of simple processes. Part II, The second law of thermodynamics: Power cycles and refrigeration cycles. The second law of thermodynamics. The thermodynamic scale of temperature. Entropy. Part III, Applications: Steam power plants. Internal-combustion engines. Refrigeration. Compressors. Nozzles and turbines. Venturi meters, flow nozzles, orifices, and pitot tubes. Air conditioning. Appendix. Index.

Note. An introductory textbook for engineering college students. It is arranged so as to emphasize basic thermodynamic principles rather than characteristics of systems. The author is Professor of Thermodynamics at Iowa State College.

SWEIGERT RAY L. AND MARIO J GOGLIA
Thermodynamics. New York The Ronald Press Company 1955 355 p. illus. 24 cm. $6.50. 6054

Contents: Introduction. The first law of thermodynamics. First law applications. The second law of thermodynamics. Properties of the pure substance and the perfect gas. Processes in the perfect gas. Gas dynamics. Gases and vapors. Mixtures. Thermodynamics and chemistry. Applied thermodynamics. Appendixes. Index.

Note. An introductory textbook written by two members of the faculty of Georgia Institute of Technology. It is addressed to engineering students rather than to students of physics, and it covers the traditional ground of such courses. The main emphasis is on theory; however there are incidental references to engineering applications, and most of the problems are concerned with such applications. A special feature of the exposition is the inclusion of a high number of "illustrated examples" of computations of various kinds of problems.

YOUNG VINCENT WILLARD
Basic engineering thermodynamics. New York McGraw Hill Book Company Inc., 1952 358 p. illus. 24 cm. $7 00. 6055

Contents: Fundamental definitions and concepts. The first law and the closed system. The first law and the open system. The reversible process and the reversible cycle. The second law of thermodynamics. Entropy—a property of the system. The pure substance. General thermodynamic equations for the pure substance. The perfect gas. Mixtures of gases and vapors. Steady flow of fluids—the turbine. Power—gas systems. The reciprocating steam engine. Power—vapor systems. Refrigeration. The evaluation of irreversibility. The steady flow of fluids in pipes and ducts. Real gases. Thermodynamics of combustion. The transmission of heat. Appendix. Index.

Note: An introductory treatment designed for use in college courses offered to undergraduate students of mechanical engineering. The basic theory is adequately covered and is related to familiar engineering applications. The discussions of most points are explicit and fairly full, hence more of the text can be comprehended by the student without the assistance of an instructor than of texts written in a condensed style. The author was formerly Professor of Mechanical Engineering in Oklahoma Agricultural and Mechanical College.

YOUNG VINCENT WILLARD AND GILBERT A. YOUNG
Elementary engineering thermodynamics. Third edition. New York McGraw Hill Book Company Inc., 1947 268 p. illus. 23 cm. $7.50. 6056

Contents: Introduction. General laws and equations. Thermodynamic characteristics of gases. Frictionless nonflow processes—gas systems. The Carnot cycle—entropy. Heat-engine cycles—gas systems. Air compressors. Properties of vapors—vapor tables. Frictionless nonflow processes for vapors. Steady-flow processes for gases and vapors. Vapor cycles. Refrigeration. Mixtures of air and water vapor. Appendixes. Index.

Note: The third edition of this college textbook reflects wartime changes in emphasis on some of the applications of thermodynamics.

KNUDSEN, JAMES G, AND DONALD L KATZ
Fluid dynamics and heat transfer Ann Arbor, Mich. University of Michigan Press 1954 247 p illus 23 cm. (University of Michigan Engineering Research Institute Bulletin no 37) $3 50 6043

Contents (abridged) Part I, The mechanism of fluid flow Part II, The energy relationships of flowing fluids. Part III, Convection heat transfer Conclusion. Table of nomenclature. Bibliography Index.

Note A fundamentally different approach to the analysis of heat transfer processes in chemical engineering is presented in this work. The mechanisms, or phenomena, of fluid flow in circular tubes and closed conduits of various other shapes are studied from the standpoint of their usefulness in the solution of heat transfer problems. Also studied from the same standpoint are flows past plates, cylinders, spheres, flows through tube banks, and other flow situations encountered in chemical processing equipment. Equations and graphs for predicting velocity profiles for the different types of flow are included. The work was based both on the literature and on the authors' research.

LEE, JOHN FRANCIS, AND FRANCIS WESTON SEARS
Thermodynamics. Reading Mass Addison Wesley Publishing Company 1955 543 p illus. 24 cm. $8 50 6044

Contents Fundamental concepts. Equations of state. The first law of thermodynamics. Some consequences of the first law The second law of thermodynamics. Entropy Combined first and second laws. Fluid flow Heat transfer Single-phase and two-phase mixtures. Vapor power cycles. Thermodynamics of internal combustion engine processes. Refrigeration processes. Thermodynamics of reactive systems. Collateral reading Appendixes Thermodynamic properties of steam. Thermodynamic properties of air Thermodynamic properties of mercury Thermodynamic properties of refrigerants. Miscellaneous tables and charts. Systems of units. Index.

Note A textbook designed for use in first courses in thermodynamics in engineering colleges and other schools where separate courses in thermodynamics are offered. It covers basic principles and related computations. The working principles of standard applications, such as refrigeration machines, are described, but the authors have not attempted to cover or even mention a wide range of applications.

LICHTY LESTER CLYDE
Thermodynamics Second edition New York McGraw Hill Book Company Inc. 1948 341 p. illus 23 cm $6 75 6045

Contents Thermodynamic mediums and their coordinates. Energy and energy terms. The energy equation and processes. Properties of mediums. Thermodynamic processes. Mixtures of mediums. Availability of energy Thermodynamic cycles. The combustion process. Internal-combustion engine and gas-turbine processes. The flow of fluids. Thermodynamic relations and properties of mediums. Index

Note A textbook for engineering students with the purpose of presenting, as simply as possible, explanations of fundamental theory and principles rather than the mathematical formulas and mechanical methods based on them. There are many examples, with their solutions, to illustrate the applications of the principles, and additional exercises upon which the student can test his understanding The general plan of organization of the material in the first edition has been followed. Taking into consideration recent scientific developments, however and experience in the use of the text in courses as well, some sections have been rewritten, some simplified. The section on properties of media has been expanded. An entire chapter devoted to thermodynamic processes has been added, and also section on gas turbines.

MCADAMS WILLIAM H
Heat transmission Sponsored by the Committee on Heat Transmission National Research Council Third edition New York McGraw Hill Book Company Inc 1954 532 p. illus. 24 cm. (McGraw Hill series in chemical engineering, Sidney D Kirkpatrick, consulting editor) $9 00 6046

Contents Introduction to heat transmission. Steady conduction Transient conduction. Radiant-heat transmission. Dimensional analysis. Flow of fluids. Natural convection. Introduction to forced convection. Heating and cooling inside tubes—outside tubes. Compact exchangers, packed and fluidized systems. High-velocity flow rarefied gases. Condensing vapors. Boiling liquids. Applications to design. Appendix. Bibliography and author index. Subject index.

Note. An authoritative work, used since the publication of the first edition as a textbook for students and a reference book for practicing engineers. It is outstanding for its integration of experimental data and for its relation of the experimental results to problems of practical design. Fundamental approaches to design problems rather than the details of solution of individual specific problems are emphasized. However some worked examples of specific problems are included as illustrations. The second edition was published in 1942 A wide range of new information derived from experimental investigations made since the first edition was written, and including extensive studies made under government sponsorship during World War II and later has been added in this edition, while some older material was deleted. The literature has been covered through 1952 with a few references to 1953 publications.

MOONEY, DAVID A.
Introduction to thermodynamics and heat transfer Englewood Cliffs N J Prentice-Hall, Inc., 1955 429 p illus. 23 cm. $6.50. 6047

Contents. Introduction. Work. Temperature and heat. Properties of systems. First law of thermodynamics. Flow processes—first law analysis. Second law of thermodynamics. Basic applications of the second law Properties of pure substances. Tabulated properties—steam tables. Properties of gases. Properties of gaseous mixtures. Vapor cycles. Combustion processes—first law analysis. Gas cycles. Fluid flow—nozzles and turbines. Gas compressors. Refrigeration. Heat transmission. Appendix tables and graphs. Index.

Note. The author's *Mechanical engineering thermodynamics* was published in 1953 It is a rather substantial introductory text for engineering students. The present book is a shorter one. Its terminal chapter on heat transmission does not appear in the earlier book otherwise, the matter in it has largely been taken over from the predecessor The reduction in length has been achieved by omitting chapters and sections of chapters on the 1953 book. Readers who use the book outside of college courses may prefer the earlier one, because of the aid to comprehension afforded by its more abundant illustrations of applications of the theoretical material.

MORSE, FREDERICK TRACY
Elements of applied energy Princeton D Van Nostrand Company, Inc., 1947 444 p. illus. 24 cm. $6 00 6048

Contents Introduction to applied energy Thermodynamic properties. Fuels and combustion. Energy in action. Mechanical elements of heat engines. Air and energy Refrigeration and air conditioning. Spark ignition engines. Compression ignition engines. Gas turbines. Jet propulsion. External combustion power plants. Steam generation. Steam power. Conclusion. Index. Supplement (tables and chart)

Note A textbook for engineering college students. It is intended to serve either as a preparation for more rigorous courses, or as terminal course for students not intending to pursue thermodynamics beyond an introductory course. The emphasis is upon applications of thermodynamics. The work is generously illustrated with reproductions of photographs and diagrams, and each chapter concludes with number of practical problems.

SCHNEIDER P J
Conduction heat transfer Reading, Mass. Addison-Wesley Publishing Company, Inc., 1955 395 p illus. 24 cm $10 50 6049

Content Introduction. Steady one-dimensional systems. Differential equations of Bessel and Legendre. Extended surface. Fourier series and integration of partial-differential equations. Steady two-dimensional systems. Steady-state numerical method. Steady heat-source systems. Steady porous systems. Transient systems—Heating and cooling—Unsteady boundary conditions, stationary and moving

Steam

HIGGINS, ALEX

Boiler room questions and answers. New York: McGraw Hill Book Company Inc. 1945. 139 p. illus. 29 cm. $5.00. 6063

Contents (abridged) Boiler regulations and methods of study. Fire-tube boilers—heating surface. Construction materials and details—attachments and processes. Stays, stay bolts, boiler calculations. Steam gauges and water columns. Safety valves, water-level alarms, fusible plugs. Boiler-feed and blowoff accessories, valves. Boiler construction, cleaning and inspection. Boiler foundations and settings. Some typical boiler repairs. *Flue-gas analysis:* method and meaning. Draft and its control. Hand firing and stoker firing. Facts about pulverized fuel, gas, oil and combustion. Boiler feed-water heating and treatment (Part). Heat facts, laws and problems. How to use steam tables. Injectors and pumps. Pipe and piping accessories. Index.

Note This book, written for power plant operating personnel, is designed primarily to help men prepare for written examinations for engineers' licenses. The exposition, in question-and-answer form, is supplemented by a generous number of illustrations. The exceptionally thorough index makes the book useful also as a reference manual to operating engineers on the job.

KEENAN JOSEPH HENRY AND FREDERICK G. KEYES

Thermodynamic properties of steam including data for the liquid and solid phases. New York. John Wiley & Sons, Inc., 1936 [illegible] p. illus. 26 cm. $5.50 6064

Contents Introduction. Symbols used in tables. Table i, Saturation: temperatures. Table ii, Saturation: pressures. Table iii, Superheated vapor. Table iv, Compressed liquid. Table v, Saturation: solid-vapor. Table vi, Viscosity. Table vii, Heat conductivity. Table viii, Correction factors. Table ix, Thermometer calibration tables. Table x, Logarithms to the base of 10. Table xi, Logarithms to the base of [illegible]

Note This edition incorporates general revisions of the values adopted as a basis for the evaluation of the properties of water. In addition, the range of temperatures and pressures has been extended to [illegible] degrees F and 1500 lbs. per square inch. Tables giving viscosity, heat conductivity, specific heat, compressed liquid properties, data on ice and its vapor, as well as other physical tables are included.

MACNAUGHTON EDGAR

Elementary steam power engineering. Third edition. New York John Wiley & Sons, Inc., 1948. 640 p. illus. 23 cm. $7.50 6065

Contents (abridged) Thermodynamic principles and processes. Properties of air, water and steam. Steam boilers and settings. Superheaters, desuperheaters, attemperators, purifiers and steam cycles. Fuels. Coal handling and ash-handling equipment. Combustion, flue gas analysis, boiler losses. Methods of burning coal, smoke prevention, furnaces, and refractories. Methods of burning gas, oil, and pulverized fuel. Rating, efficiency and testing of steam boilers. Draft and methods of producing draft. Heat-saving equipment. Boiler feed-water conditioning, scale removal, evaporators, deaerators, and tube cleaners. Reciprocating steam engines—simple engines. Slide-valve engines, valve diagrams, and slide-valve setting. Multi-valve engines. Compound, multi-expansion, and uniflow engines. Steam turbines. Condensers and condenser auxiliaries. Steam-driven and power-driven pumps. Modern power plants and factors related to their design and operation. Appendix tables. General references. Index.

Note An engineering college textbook in which practical aspects are emphasized, but which contains also adequate expositions of the theory. All of the major and auxiliary types of steam generating equipment and steam power machinery are described. In most chapters the discussions of theory follow the descriptive material. A considerable portion of the book can be understood without mathematics and therefore is suitable as home study material for practical workers. Numerous changes have been made in this edition. There are now 43 tables and almost 500 illustrations.

POTTER, PHILIP JOHN

Steam power plants. New York The Ronald Press Company 1949 503 p. illus. 24 cm. (A volume of a series in mechanical engineering Burgess H. Jennings, editor) $7.00 6066

Contents: Introduction. Flow of fluids. Pumps. Theory of heat transfer. Fuels and combustion. Steam generators. Boiler auxiliaries—fuel-burning equipment—draft equipment—feedwater treatment. Heat exchangers—condensers—feedwater heaters—evaporators and miscellaneous heat exchangers. Steam turbines. Steam engines. Heat balances. Economics of steam power plants. Appendix. Index.

Note: An engineering college textbook in which the emphasis is on the fundamental principles of fluid flow heat transfer, etc rather than on the description of a large range of power-plant equipment. However the operating principles and characteristics of a considerable range of typical equipment are described. There is also a fair amount of material on the classification and analysis of fuel. The chapters are supplemented by good lists of problems and by short bibliographies.

POWELL, SHEPPARD T

Water conditioning for industry New York McGraw Hill Book Company Inc. 1954 548 p. illus 24 cm. $10.00 6067

Contents. Natural waters and their impurities. Removal of suspended solids by settling. About chemical coagulants. Chemical coagulation—theory. Application of coagulants, flocculation, and settling. Filtration. Cold-process softening by chemicals. Hot-process softening by chemicals. Softening and demineralization by ion-exchange materials. Evaporators—their design and operation. Deaeration of feedwater. Internal treatment by chemicals—theory. Equipment for secondary chemical treatment. Water conditioning for recirculation systems. Steam contamination and means for correction. Determination of steam purity. Corrosion of metals—causes and control. Corrosion problems in high-pressure boilers. Electrolytic processes for corrosion control. Caustic embrittlement of boiler steel. Boiler scales and their identification. Chemical cleaning of power plant equipment. Determination of solids in boiler water. Miscellaneous treatments. Analytical procedures. Appendix. Index.

Note Primarily devoted to the problems and techniques of preparing feedwater for high pressure boilers, this book describes also numerous water conditioning processes applicable to other fields of manufacturing. All of the industrially important processes of feedwater treatment are described in considerable detail with literature references to sources of additional information. The book is addressed to engineers and chemists who are concerned with water quality and treatment incidentally rather than to specialists in water treatment. The 40-page chapter on analytical tests describes a selection of standard tests.

SALISBURY JOHN KENNETH

Steam turbines and their cycles. New York John Wiley & Sons, Inc., 1950 645 p illus. 23 cm. $9 50 6068

Contents (abridged) Part i, Fundamentals of turbine design. Power-plant cycles. Flow of fluids. Turbine external characteristics. Stage efficiency. Design of turbine stage. Steam path design. Part ii, The regenerative cycle. Regeneration and non-extraction performance. Modern heat-balance practice. Conventional heat balance. Shortcut to turbine-cycle heat rate. Part iii, Cycle analysis: Heater cycle losses. Cycle equations for homogeneous arrangements. Single-heater formulas. Other heater arrangements. Distribution loss. Distribution loss in flashed heaters. Terminal difference and pressure-drop loss. Miscellaneous cycle corrections. Part iv Application engineering. Design details. Estimating steam rates. Estimating heat rates. Appendix. Index.

Note: A substantial treatise on the engineering aspects of steam turbines. The subject is treated mainly from the standpoint of design, but much of the information is of interest also to engineers who are concerned with the specification of turbines for specific applications or with general supervision of power plant operating and maintenance programs. Adequate attention is paid to thermodynamics and fluid flow and much emphasis is given to cycle analysis. The section on the regenerative cycle is a considerable extension of a paper which, when presented before the American Society of Mechanical Engineers in 1943, won the Melville medal for the best original contribution of the year. There is a three-page selected bibliography.

SEVERNS WILLIAM H. AND OTHERS

Steam, air and gas power By William H. Severns, Howard E Degler and John C.

It also provides revised discussions of certain topics, among which are Joule's law and entropy The format remains the same as before, as does the purpose—namely to provide the engineering student with an introduction to the basic theory of heatwork apparatus. Problems are included with each chapter

STEAM ENGINEERING

BUTTERFIELD, THOMAS EDWARD, AND OTHERS

Steam and gas engineering by Thomas E. Butterfield, Burgess H. Jennings, and Alexander W Luce. Fourth edition. New York D Van Nostrand Company, Inc., 1947 588 p illus. 24 cm. $7 00 6057

Contents (abridged) Energy units, laws of thermodynamics. The steam engine. Properties of steam. Steam cycles. Fuels and power. Combustion. Combustion equipment for steam generation. The steam boiler. Boiler plant auxiliary apparatus. Steam turbine types and performance. Turbine nozzle and blading calculations. Condensers and condensing equipment. Steam power plant cycles, heat balances. Gas properties. Gas cycles. The internal combustion engine. Gas and gasoline engine types. Oil engines. The gas turbine. Compression and refrigeration. Index.

Note An established textbook for students in engineering colleges. The treatment assumes that the reader will have had introductory college courses in physics, chemistry and calculus. As in previous editions, the greater part of the space is given to steam engineering. Emphasis is upon operating characteristics rather than mathematical analysis, but the treatment is not merely descriptive. In this edition, the chapters on steam turbines, combustion equipment, compression in connection with combustion and refrigeration have all been expanded and the work as whole has been extensively revised and rearranged. The chapter on gas turbines is a new addition and several useful tables have been added.

CHURCH, EDWIN FAYETTE, JR.

Steam turbines. Third edition. New York McGraw Hill Book Company, Inc. 1950 531 p illus 24 cm. $8 50 6058

Contents Types and characteristics. Steam-turbine cycles. Flow of steam in nozzles. Nozzle proportions and tests. Impulse-blading velocity diagrams. Impulse-blading proportions. Reaction-blading velocity diagrams and blading proportions. Effects of use, capacity speed, and steam conditions on the arrangement of turbine elements. Aerodynamic considerations. Elements of supersonic flow Vibrations. Structural elements, materials, and stresses. Losses. Efficiency reheat factor and condition line. Output variation and governing. Turbine performance. Design. Problems. References. Index.

Note. A standard engineering college textbook. In this edition, much new material, both textual and pictorial, has been added, and some of the material in the earlier editions has been discarded. The level of treatment has been raised somewhat, so that the book is now suitable for use in graduate as well as advanced undergraduate courses. Also, it will now be more useful to engineers out of school who are in need of an introductory and up-to-date survey. The bibliography seven pages long, consists mainly of periodical articles.

CROFT, TERRELL WILLIAMS editor

Steam boilers revised by R. B Purdy Second edition New York McGraw Hill Book Company Inc., 1937 417 p illus 21 cm $6 00 6059

Contents Function, classification and requirements of the steam boiler. Evolution of the steam boiler Steam generation and boiler capacity Fire-tube boilers. Water-tube boilers Super-heaters. Water walls. Materials used in steam boiler construction. Stresses in and strength of steam boilers. Joints. Braces and stays. Fire tubes and water tubes. Manholes and handholes. Boiler accessories. Fuels. Combustion and hand firing. Stokers and pulverized coal. Petroleum and gaseous fuels. Boiler settings and furnaces. Draft and its production. Chimneys, breechings and dampers. Mechanical draft. Economizers and air preheaters. Feed water and feed-water treatment. Management, inspection, and maintenance of steam boilers. Selection of steam boilers. Index.

Note This book covers the functions, types, construction, accessories, capacities, ratings, and selection of steam boilers. Code and inspection regulations are also discussed, and changes in code requirements are reflected in this new edition. Other changes occur in the treatment of types of boilers, stokers, pulverized coal, oil burning, boiler settings, furnaces, etc.

CROFT, TERRELL WILLIAMS, editor

Steam-engine principles and practice. Revised by E J Tangerman. Second edition New York McGraw Hill Book Company, Inc., 1939 513 p. illus. 21 cm. (Power plant series) $6 50 6060

Contents: Function and principle of the steam engine. Steam-engine mechanisms and nomenclature. Steam-engine indicators and indicator practice. Slide valves and their setting. Corliss and poppet valves and their setting. Fly-ball steam-engine governors, principles and adjustment. Shaft steam-engine governors, principles and adjustment. Compound and multi-expansion engines. Condensing and non-condensing operation. Steam-engine efficiencies and how to increase them. Steam engines of later types. Steam-engine testing. Reciprocating-engine management, operation, and repair. Use of superheated steam in engines. Selecting an engine. Steam-engine lubrication. Solutions to problems. Index.

Note: A practical text and reference book for the operating engineer or plant superintendent. It is limited to discussion of the uses and practical applications of steam engines and their selection, operation, care, and methods of repair. No attempt has been made to include mathematical theory of operation or principles of design. A large number of drawings illustrate the text, and there are descriptive expositions with worked-out arithmetical examples and a number of review questions following each chapter. The second edition incorporates data on newer types of engines and describes applications developed between 1922-1939

CROFT, TERRELL WILLIAMS, editor

Steam power plant auxiliaries and accessories, revised by D J Duffin. Second edition. New York McGraw Hill Book Company, Inc., 1946 583 p. illus. 21 cm. $7.50. 6061

Contents Pump theory and calculations. Reciprocating pumps. Centrifugal and other impeller-type pumps. Injectors. Methods of boiler feeding. Feed-water heaters, deaerators, evaporators. Economizers and air preheaters. Steam condensers. Spray ponds and cooling towers. Steam piping of power plants. Steam separators. Steam traps. Appendix. Solutions to problems. Index.

Note. This work is designed as practical reference book for operating men in power plants and as textbook for students. Compared with the first edition (1922) the present edition is extensively revised and considerably enlarged. There is new material on such topics as deaerators, air preheaters, piping, maintenance and cavitation. The appendix of steam-engineering data also is a new addition.

GAFFERT, GUSTAF A.

Steam power stations. Fourth edition. New York McGraw Hill Book Company, Inc., 1952 637 p illus. 24 cm. $8.50 6062

Contents. Introduction. Equipment of power station. Steam engines. Steam turbines. Heat transfer Condensers. Feed-water heaters and evaporators. Feed-water treatment. Fuels and combustion. Steam-generating units. High-pressure and binary-cycle boilers. Dust collectors. Economizers and air heaters. Superheaters and reheaters. Fuel-burning equipment. Ductwork and piping. Draft system. Coal and ash handling. Pumping equipment. Steam-station costs. Load curves and plant location. Selection of prime movers and steam-generating equipment. Cycle arrangement. Binary vapor cycles. Station design. Index.

Note An engineering college textbook which has been widely used since the publication of the first edition in 1937 It provides thorough introductory treatment in which theory and description are combined. Steam-operated prime movers, steam-generating equipment, power house auxiliary machinery steam-power economics, power station layout, etc., are covered, but the structural design of power houses and electrical machinery are omitted. In other words, the scope is steam-generating machinery and the machines which are auxiliary to steam generation. In comparison to the third edition, the book has been rather extensively revised.

ELLIOT, P M.

High-speed combustion engines design, production, tests. Sixteenth edition of *The gasoline motor* Philadelphia Chilton Company 1956. 805 p. illus. 22 cm. $12.00. 6075

Contents: The Otto cycle. Conversion of reciprocating into rotary motion. Layout of engines. Combustion-chamber design—detonation and turbulence. Engine cylinders. The crankcase—engine mounting. Friction of engine blocks. Pistons, piston rings, and piston pins. The connecting rod. Crankshafts and flywheels. Determination of bearing loads. Torsional vibration and vibration dampers. Engine valves. Valve-actuating mechanism. Camshaft and accessories drives. The mixing medium—gasoline and air. The carburetor. Ignition equipment. Bearings and lubrication. Water-cooling. Air-cooling. Manifolds and muffler. Speed control—the governor. Power output and other characteristics. Two-stroke-cycle engines. Engine tests and testing equipment. Thermodynamics of the combustion engine. Appendix. Plate supplement. Index.

Note: The first edition of this work appeared in 1912 under the title *The gasoline motor*. It was then and [illegible] now intended specifically [illegible] reference manual for mechanical engineers and as [illegible] text for engineering students. Details of engines and engine subassemblies made by many of the leading British and American manufacturers are described in addition to generalized discussions of [illegible] engine theory and construction. There are numerous illustrations [illegible] the text and [illegible] 11-page Plate supplement of larger drawings. The 15th edition was published in 1937. The major change [illegible] the 16th edition is the deletion of the chapter on unconventional engines and the return to the book of [illegible] chapter on thermodynamics which appeared in earlier editions but was omitted [illegible] the 15th edition. Minor changes to cover new developments in engine design, especially in automotive engines, have been made [illegible] various chapters and many new illustrations have been added.

ELLIOT, P M.

High-speed Diesel engines, for automotive, marine, railroad and industrial use, with a chapter on gas turbines. Seventh edition. Philadelphia. Chilton Company 1953 472 p illus. 22 cm. $7.50. 6076

Contents: Nature of the engine and its fields of application. Thermodynamic and other characteristics. Combustion phenomena. Fuels for Diesel engines. Fuel injection and sprays. Injection pumps, their principles and characteristics. Modern injection pumps and nozzles. Precombustion-chamber engines. Direct-injection engines. Turbulence-chamber engines. Auxiliary-chamber engines. Two-stroke engines. Loop-scavenged engines. Supercharging. Some details of engine design. Methods of starting Diesel engines. Lubrication. Operation and maintenance. Gas turbines. Index.

Note: The purpose of this standard work is to describe the more important principles of Diesel-engine design and to illustrate the application of these principles by reference to various engines [illegible] them. Thus, [illegible] is essentially an account of typical and promising designs and mechanisms. It is directed to engineers and Diesel-engine users who have [illegible] professional interest in Diesel engine design. The first edition was published in [illegible] and the sixth edition in 1952. The former chapters on aircraft engines and [illegible] types were dropped in preparing this seventh edition, and such new material was added.

JENNINGS, BURGESS H., AND WILLARD L. ROGERS

Gas turbine analysis and practice. New York. McGraw Hill Book Company Inc., 1953 487 p. illus. 23 cm. $8.50. 6077

Contents: Development of the internal-combustion engine and turbine. Thermodynamics and air properties. Gas-turbine cycles and [illegible] analyses—types and design features. Axial-flow compressors. Centrifugal and displacement compressors. Aircraft propulsion and jet engines. Power plant and transportation turbines. Fuels, combustion and combustion chambers. Stresses in turbine [illegible] components. Vibration and balancing. Materials and metallurgy. Appendix. Index.

Note: A useful, clearly written introduction, designed for use as an engineering college textbook. As implied in the title, both theory and descriptive matter are included. However, somewhat more space is given to mathematical analyses than to descriptions of turbines and related devices. Selected literature references are included. The authors are members of the faculty of the Technological Institute of Northwestern University.

JONES, C MORGAN

Diesel operator's guide. New York McGraw Hill Book Company Inc. 1956 377 p. illus. 24 cm. $7 00 6078

Contents: The modern Diesel engine. Trouble shooting. Engine starting systems. Fuel-injection systems. Pistons, piston rings, and rods. Cylinder liners. Valves and valve gears. Crankshafts and bearings. Engine governors. Cooling systems. Lubrication. Air-intake systems. Exhaust systems. Pumps and pumping systems. Engine drives. Fuel storage. Dual-fuel engines. Engine foundations. Engine maintenance schedules. Index.

Note: A practical introduction to Diesel engine principles and mechanisms, and [illegible] manual of trouble shooting and repair operations. As the title indicates, it is addressed to men [illegible] who are in charge of Diesel engines. There is no emphasis [illegible] however on specific makes of engines, however, the mechanisms common to all and also the chief variations of these mechanisms are covered.

KATES EDGAR J

Diesel and high-compression gas engines—fundamentals. Chicago American Technical Society 1954 396 p. illus. 22 cm. $5.50. 6079

Contents: What [illegible] Diesel engine is. Distinguishing features of Diesel engines. Basic construction of [illegible] Diesel engine. Basic terms of physics and engineering. Heat and combustion. Oil and gaseous fuels. Engine power and fuel consumption. Engine rating and performance. Engine types. Stationary parts—frames, cylinders, and heads. Major moving parts. Valve gear and scavenging systems. Injecting fuel. Burning the fuel. Lubricating the Diesel. Governing. Typical Diesel engines. High-compression gas-burning engines. Auxiliary systems. Operation and maintenance. Index.

Note: A textbook for practical students. Although familiarity with spark-ignition engines would be helpful, the author has not assumed that his readers will have this knowledge. He has started the exposition with the very elements of Diesel engines and of combustion in such engines. Mechanical details of modern Diesel engines are described generally without reference to particular makes. Liberal use is made of illustrations. The inclusion of [illegible] chapter on high-compression gas-burning engines—which are [illegible] type of increasing importance in regions [illegible] where natural gas is cheap and abundant—is [illegible] useful feature. The book [illegible] suitable for home study as well as for use in organized classes.

LEE, JOHN F

Theory and design of steam and gas turbines New York McGraw Hill Book Company Inc., 1954 502 p. illus. 24 cm. $9.50. 6080

Contents: Steam-turbine types. Gas-turbine types. Fundamentals of thermodynamics. Steam-turbine cycles. Gas-turbine cycles. Elementary gas dynamics. Design of nozzles. Energy interchanges in fluid machinery. Design of turbine flow passages. Mechanical aspects of turbine design. Steam-turbine control and performance. The centrifugal compressor. The axial-flow compressor. Combustion. The regenerator. The gas-turbine power plant. Appendix. Index.

Note: A new engineering textbook in which fundamental theory and current design are the main topics. Little descriptive material is included. Steam and gas turbines are viewed as different versions of the same fundamental machine and [illegible] is shown that much of the basic theory is applicable to both. The chapter on the centrifugal compressor—a necessary accessory to the gas turbine—is [illegible] full one. In addition to its intended use as [illegible] text, the book will be useful to graduate engineers who are well versed in the steam turbines and need [illegible] basic understanding of the gas turbine.

LICHTY LESTER CLYDE

Internal-combustion engines. Sixth edition. New York McGraw Hill Book Company Inc., 1951 598 p. illus. 24 cm. $7.50. 6081

Contents: The internal-combustion-engine process. Thermodynamics for engine analysis. The combustion process. Air-standard cycle

Miles Fifth edition New York John Wiley & Sons Inc 1954 502 p illus 22 cm $6 50 6069

Contents Basic definitions. Heat power plants. Principles of thermodynamics. Steam and steam calorimetry Fuels and combustion Steam boilers and generators. Steam boiler auxiliaries. Feed-water heating and conditioning. Draft apparatus—chimneys and fans. Reciprocating steam engines. Steam turbines. Steam-condensing equipment. Pumps. Compression f air and gases. Gas turbines. Internal-combustion engines. Mechanical refrigeration. Appendix. Additional tables. Index.

Note. A standard engineering college textbook. It is designed for use in introductory courses, especially courses offered to students who do not plan to specialize in this branch of engineering and therefore require a general rather than a rigorous course. Elementary theory is covered and the principal types of heat-power devices are described. The fourth edition was published in 1948. The chapters on gas turbines and mechanical refrigeration are new in this fifth edition. Chapters carried over from the fourth edition have been revised in varying degrees, some f them extensively There is somewhat less emphasis on the steam engine.

SPRING, HARRY MORTIMER

Boiler operator's guide, construction operation, inspection, and maintenance of steam boilers, with 310 typical steam engineer's examination questions and answers. New York McGraw Hill Book Company, Inc. 1940 353 p illus 23 cm $5 75 6070

Contents Preface. Abbreviations and symbols. General construction and stress calculations. Fire-tube boilers. Watertube boilers (straight tube) Watertube boilers (bent tube) Watertube boilers (bent tube)—special service and European. Boiler appliances and auxiliaries. Boiler-plant management. Problems of plant operation. Appendices Glossary of boiler terms. Materials. Boiler scale. Instructions for riveted patches. Boiler safety rules. Index.

Note A text and reference book on boilers and boiler equipment covering the design construction, installation, operation, and maintenance f a variety of boilers from fire-tube type to high-pressure steam generators in the United States and abroad. A discussion of plant management including personnel problems and work schedules is also given. The text is written in nontechnical terms for the benefit of the beginner Questions and answers, typical f examinations gi en for boiler inspectors' and engineers' licenses by various states of the United States of America, are given at the end of each chapter

WOODRUFF, EVERETT BOWMAN, AND HERBERT B LAMMERS

Steam plant operation. Second edition New York McGraw Hill Book Company, Inc. 1950 543 p illus 25 cm. $8 00 6071

Contents Boilers. Construction f boilers. Combustion of fuels. Settings, combustion equipment and heating surfaces. Boiler accessories. Operation and maintenance of steam boilers. Pumps. Reciprocating steam engines. Valve-operating mechanisms. Operation and maintenance of steam engines. Construction of steam turbines and auxiliaries. Operating and maintaining turbines and auxiliaries. Auxiliary steam-plant equipment. Appendices. Index.

Note A standard work for stationary engineers and firemen. It provides a fairly comprehensive description of present-day steam plant equipment, together with clear expositions of such matters as the principles of combustion and the practices of handfiring and stoker operation. This edition has been extensively revised and enlarged to cover advances since 1935 Particular attention is given to the operation of new types of equipment thus, the chapters on boilers and boiler construction now include discussions of heat recovery equipment, steam separators, new types f stokers, dust collecting systems, etc. The chapter on fuel combustion has been doubled in length, and the description of steam turbines now runs to two chapters. Review questions and problems are again included.

INTERNAL COMBUSTION ENGIN

ADAMS, ORVILLE L

Diesel operation and maintenance. N York Prentice-Hall, Inc., 1946 366 p. il 24 cm $6 65 6

Contents Fundamental problems. Problems of application. problems of operation. Metallurgical problems. The fuel-mixing lems. Basic maintenance problems. Inspection procedure. Piston maintenance and inspection. Piston and liner maintenance. Be failures and maintenance problems. Problems of lubricatio. oil and combustion problems. Appendices. Metallurgical da Tables and formulas. Lubricating oil specifications. Index.

Note. A skillfully written introduction to the basic princ and problems of Diesel engines, together with practical direc for Diesel engine operation, upkeep, and repair. The author cusses the advantages, limitations, and the arious types of D engines, as well as major and minor overhaul procedures. Oper details, however are not as specific as those found in manu turers' instruction manuals for particular makes of engines. volume is intended for technical school classrooms or for instruction and it assumes that the reader will be able to u stand engineering terms and graphs. The author was an office the U S. Navy during World War II and had charge of D engine instruction and ship repairs for a fleet of Diesel-driven s

DUSINBERRE, G M

Gas turbine power Scranton Internatio Textbook Company, 1952 256 p. illus. cm (International textbooks in mechani engineering E F Obert, consulting edito $6 25 60

Contents. An introduction. Thermodynamics. The basic gas t bine cycle. Variations on the basic cycle. Gas flow Turbines. C pressors. Combustion. Heat transfer. Part-load operation. Fut variations of the basic cycle. Appendix Tables. Bibliography Ind

Note. Thermodynamic and heat balance aspects of the gas turb are emphasized in this book. Design aspects, such as the stresses turbine blades, are covered also. Applications to small turbines, s as are used in airplane engines, are not predominant, instead, t book is written so that most of its contents are as applicable large stationary turbines as to the smallest ones in use. The tre ment is introductory to the subject, and the book is designed p marily for students in engineering colleges he have completed b courses in thermodynamics, heat transfer strength of materials, e The bibliography contains about 130 references.

GILL, PAUL W , AND OTHERS

Fundamentals of internal combustion e gines as applied to reciprocating, gas turbin and jet propulsion power plants. By Paul W Gill, James H. Smith Jr and Eugene Ziurys. Revised edition 1954 Annapolis Th United States Naval Institute, 1954 543 p illus. 24 cm. $5 00 607

Contents Introduction to reciprocating engines. Engineering thermodynamics. Power cycles. Engine power Fuels. Carburetion Spark ignition Combustion in the SI engine. Cooling. Spark ig tion engine performance. The compression ignition engine and fu injection Combustion in the CI engine. Compression ignition en gine performance Comparison of SI and CI engines. Lubrication The theory and fundamentals of gas turbines. Jet propulsion engines Rocket engines. Hydrogen peroxide for propulsion power. Nuclear power for ship propulsion Appendices. Index

Note. This textbook was prepared primarily for use in a cour given to first year midshipmen of the United States Naval Academy It is a presentation of the basic theory fundamental principles, an performance characteristics of the three major categories of interna combustion engines. It covers the nomenclature, the arious com ponents of these engines, the capabilities and limitations of th various types of power plants, tests, and recent developments. Th second edition was published in 1952 The present third edition written at the same level and covers essentially the same materia as the preceding one. However the book has been reorganized, and number of chapters, including the one on uclear power for ship propulsion, hav been extensively rewritten.

[illegible], Harry A.
Gas turbines. New York The Ronald Press Company 1951 460 p. illus. 23 cm. (A volume of a series in mechanical engineering, Burgess H. Jennings, editor) $7.00. 6088

Contents: Introduction. Principles of thermodynamics. Simple [illegible] gas turbines. Variations of the basic cycle. Closed-cycle [illegible] gas turbines. [illegible] parts. The axial-flow compressor. Centrifugal and [illegible] compressors. Axial-flow turbines. Combustion systems. [illegible] design. Plant performance. Miscellaneous plants. [illegible]. Index. Appendix. Properties of air and combustion gases.

Note: A well-rounded introductory exposition of gas turbine theory and current practice. The book is designed chiefly as [illegible] for the use of upperclass engineering students. However, [illegible] organized and written that it can serve equally well as [illegible] book on the subject for engineers out of college who have the [illegible] knowledge of basic thermodynamic concepts and terminology. The [illegible] range of gas turbine practice is covered from the [illegible] to the largest stationary units.

Taylor, Charles Fayette, and Edward S. Taylor
The internal combustion engine. Revised edition. Scranton International Textbook Company 1948. 339 p. illus. 24 cm. (International textbooks in mechanical engineering) $6.75. 6089

Contents: Engine capacity and efficiency. The air cycle. Thermodynamics of the [illegible] medium. Fuel-air cycles. Combustion in [illegible] engines. Detonation in the spark-ignition engine. [illegible] Combustion in the compression-ignition engine. Direct heat losses. [illegible] requirements of the spark-ignition engine. Fuels for the [illegible] combustion engine. Engine friction. Lubrication and [illegible] systems. Air capacity of four-cycle engines. Two-stroke engines. Engine performance. The gas turbine. Bibliography. Index.

Note: An engineering [illegible] text that has been planned for [illegible] students who are preparing to work in engine research and design. Many of the experimental data have been developed from original work carried out by the authors at the Massachusetts Institute of Technology. The bibliography is extensive [illegible] to engineers actually at work in the field. The chapter on the gas turbine is new in this edition, and there are many minor changes throughout the text. The bibliography has been [illegible].

Vincent, Edward Thomas
The theory and design of gas turbines and jet engines. New York McGraw Hill Book Company Inc., 1950. 606 p. illus. 23 cm. $9.00. 6090

Contents: Some thermodynamic principles. Fundamentals of gas flow. Jet propulsion. Power plant cycles. Jet-propulsion devices. The turbine power plant. The fundamental principles of [illegible] machines. The centrifugal compressor. The design of centrifugal compressors. The axial-flow compressor. Design of axial compressors. Turbine theory. Turbine design. Combustion chambers, fuel systems, and fuels. Materials. Regenerators. Bibliography. Index.

Note: A textbook intended chiefly for upperclass undergraduate and graduate students in engineering schools. Its purpose is to present the theory which is essential in practical design of turbines and [illegible] the theory to the solution of specific design problems. The principles and characteristics of the chief types of gas turbines and jet units are described in engineering terminology including mathematical equations and graphs.

ATOMIC ENERGY AND REACTORS

Beckerley, James G., editor
The Geneva series on the peaceful uses of atomic energy Nuclear fuels. Edited by David H. Gurinsky and G. J Dienes. Princeton, N J D Van Nostrand Company 1956 364 p. illus. 24 cm. $7.50 6091

Contents: Part I. The metallurgy of uranium and thorium. The preparation of uranium metal. The physical metallurgy of uranium. The alloys of uranium. Casting and fabrication of uranium and its alloys. The production of thorium. The metallurgy of thorium and its alloys. Part II. Radiation effects: Basic considerations in radiation effects. The effect of radiation on structural materials. Radiation effects in fissionable materials. Part III. Solid and fluid fuels: The technology of reactor fuels. A uranium base fuel element (details of the fabrication of the Brookhaven fuel element). Dispersion type fuel elements. Fluid fuel systems. Additional chapter references. General bibliography. Subject index. Name index.

—— Exploration for nuclear raw materials. Edited by Robert D Nininger Princeton, N J D Van Nostrand Company 1956. 293 p. illus. 24 cm. $8.00. 6092

Contents: Part I. The geology of uranium and thorium. The natural occurrence of uranium in the United States. The genesis of uranium deposits. Uranium provinces. Influence of regional structure on uranium occurrence in western United States. Part II. Techniques of prospecting for uranium and thorium: Introduction—survey of prospecting techniques. Geologic prospecting. A systematic method of exploration for and evaluation of uranium deposits in France. Radiometric prospecting. Surface radiometric techniques. Aerial radiometric techniques. Geophysical prospecting. Geophysical-geochemical prospecting. Geochemical prospecting. Botanical prospecting. Hydrogeochemical prospecting. Exploration drilling. Subsurface radiometric techniques. List of conference papers. Subject index. Name index.

Note: Listed above are the titles and contents of the volumes published to the end of 1956 in this publisher's Geneva series on the peaceful uses of atomic energy an edited selection of papers presented at the Geneva Conference. Some of the chapters in the volumes are taken from single conference papers, but [illegible] number of them are made up of sections or complete texts of more than one paper. Two additional volumes in the series were published in 1957 Nuclear reactors for research, edited by C. K. Beck, 243 p., $5.50; Nuclear power reactors, edited by James K. Pickard, 333 p., $6.50. Also published in the United States of America, although the principal places of publication are in other countries, are Progress in nuclear energy, an edited selection in eight volumes, New York, Pergamon Press, and [illegible] complete collection in 16 volumes, Proceedings of the International Conference on the Peaceful Uses of Atomic Energy Columbia University Press, 1955–56.

Commonwealth Edison Company and others
Reports to the U S. Atomic Energy Commission on nuclear power reactor technology by Commonwealth Edison Company, Public Service Company of Northern Illinois, Dow Chemical Company Detroit Edison Company Monsanto Chemical Company Union Electric Company Pacific Gas & Electric Company and Bechtel Corporation. Washington, D C. Government Printing Office, 1953 88 p. illus. 23 cm. $0.25 6093

Contents: Introduction. Report on power generation using nuclear energy by Commonwealth Edison Co. and Public Service Co. of Northern Illinois. Gas-cooled reactor. Liquid-cooled reactor. Economics. Future requirements and possibilities. Conclusions. Study of materials and power-producing reactors, by Dow Chemical Co. and Detroit Edison Co.: Specifications for economical nuclear power. Discussion of specifications. Reactor types. Allowable investment in reactors. Reactor type of known technology considered. Plutonium-power reactor feasibility study by Monsanto Chemical Co. and Union Electric Co.: Selection of reactor types for study. Description of first-choice reactor. Power plant. Economics of producing power in [illegible] combination power and plutonium-plant. Other aspects of the study. Developmental problems. Industrial reactor study, by Pacific Gas and Electric Co. and Bechtel Corp.: General considerations. Selection of reactor. Economic studies. Summary.

Note: The articles comprising this booklet are the declassified versions of reports made to the Atomic Energy Commission under agreements by four teams of nongovernmental industrial representatives. Beginning in 1951 these teams spent 11 months inside the

analysis. Internal-combustion-engine-process analysis. Deviations from ideal processes. Fuels. Combustion knock and knock rating. Carburetion and fuel injection. Manifolds and mixture distribution. Valves and valve mechanisms. Ignition of the charge. Combustion-chamber design. Engine lubrication. *Heat transfer and engine cooling.* Engine performance. *Mechanics of principal moving parts. Engine vibration and balance. Engine design. Appendix.* Index.

Note: A long-established engineering college textbook. Its coverage of specific topics, such as engine vibration and balance, is sufficiently inclusive to make the book useful to graduate engineers who find themselves in need of an introductory discussion. A special feature is the inclusion of charts that depict the results of numerous laboratory experiments and measurements on internal-combustion engines. Although this edition is a few pages shorter than the preceding edition, the work has been substantially revised. New material on such topics as throttling, supercharging, icing, and combustion-chamber design has been added.

MALEEV, V L

Diesel engine operation and maintenance, the construction, operation, maintenance, and repair of modern Diesel engines. New York McGraw Hill Book Company, Inc., 1954 504 p illus 24 cm. $8 50 6082

Contents (abridged): Part I, Introduction General description and construction. Diesel-engine principles. Part II, Diesel-engine components: Frames, cylinders, and heads. Running gear Bearings. Flywheels. Valve gear Fuel injection. Governors. Part III, Fundamentals of diesel engine work Fuels and combustion. Lubrication and lubricants. Engine cooling. Air-intake system. Exhaust system. Starting and reversing methods. Vibrations and balancing. Part IV Engine installation and operation Operating a diesel engine. Engine performance. Rating and testing. Part V Maintenance and repairs. Maintenance records and data. Engine overhauling. Special repairs and salvaging. Appendix. Glossary of terms used in diesel engineering. List of visual aids. Index.

Note A well-written introductory text. In it, Diesel engine principles, mechanical elements and systems, operation, maintenance, and repairs are all treated in a descriptive style that requires on the part of the reader no previous acquaintance with engineering terminology and comprehension of only simple mathematics. There are numerous illustrations, and most of these are reproductions of the drawings of engine sections and parts. Both the narrative text and the illustrations have been chosen to impart fairly detailed practical knowledge such as is needed by engine operators and repairmen.

MALEEV, VLADIMIR LEONIDAS

Internal-combustion engines theory and design Second edition. New York McGraw Hill Book Company, Inc 1945 636 p illus. 22 cm $8 00 6083

Contents (abridged) Principles of thermodynamics. Fuels. Combustion. Theoretical engine cycles. Combustion in spark-ignition engines. Combustion chambers of compression-ignition engines. Engine performance. Four-stroke engines. Two-stroke engines. Engine efficiencies. Four-stroke intake and exhaust. Supercharging. Two-stroke exhaust and scavenging Cooling. Cylinders—cylinder heads. Reciprocating-rotary motion. Vibration and balancing. Lubrication. Crankshafts. Flywheels and governors. Starting—reversing. Rating—testing. Gas turbines. Index. Answers to even-numbered questions.

Note. A technical treatment used both as an engineering college textbook and as review for young design engineers. Familiarity on the part of the reader with thermodynamics and engineering mechanics is assumed, although the essentials of these subjects are briefly reviewed in the preliminary chapters. This edition is more than 200 pages longer than the first edition and includes newly added material on such subjects as fuels, combustion, and gas turbines. Pertinent literature is cited in occasional footnotes.

OBERT, EDWARD FREDERIC

Internal combustion engines analysis and practice. Second edition Scranton International Textbook Company 1950 596 p illus. 23 cm $8 75 6084

Contents. Basic engine types and their operation. Engine testing. Thermodynamics. Theories of combustion and detonation. Pressure and pressure measurement. Idealized cycles and processes. Combustion charts. Fuels. Knock and the engine variables. Exhaust gas and the air-fuel ratio. Carburetion. Injection. Engine characteristics and valve timing. Spark-ignition engines. Compression-ignition engines. Lubrication. Compressors, gas turbines, and jet propulsion. Appendix. Index.

Note. A standard textbook for use in engineering colleges. Basic phenomena and principles are discussed rather thoroughly. Engine types and systems are described, but the author has not attempted to include descriptions of specific makes of engines. The discussion of selected topics—of which fuels is an example—is full enough to be useful to graduate engineers reading outside the field of their own specialty. The first edition of the book was written by Jennings and the present author. Much new material has been incorporated in this second edition.

POLSON, JOSEPH ALBERT

Internal combustion engines. Second edition. New York John Wiley & Sons, Inc., 1942 548 p. illus. 23 cm. $6.00 6085

Contents. Internal combustion engines—general discussion. Fuels. Combustion. Ideal engine cycles; constant specific heats. Ideal engine cycles variable specific heats. Gas engines. Automobile engines. Carburetors. Electric ignition. Valves and cams. Airplane engines. Diesel engines. Superchargers. Combustion chambers. Diesel fuel injection. Engine cooling. Gas turbines. Appendix. Index.

Note: A college textbook for junior or senior mechanical engineering students, describing the various cycles and types of engines in general use today A thorough knowledge of fundamental thermodynamics is assumed. In developing the subject each cycle is first described and illustrated. Theoretical development is then discussed both by the air standard constant specific heat method and by the variable specific heat method. Performance is presented and analyzed, and typical examples and problems are given. The second edition presents approximately 100 pages of new material on such subjects as specific heats of gases, cams, air cooling, aircraft engines, and gas turbines, plus new data in the appendix.

ROGOWSKI, A R.

Elements of internal-combustion engines. New York McGraw Hill Book Company, Inc., 1953 234 p illus 23 cm. $6.00 6086

Contents: Introduction. Physical principles. The air-cycle approximation. The fuel-air-cycle approximation. The actual engine cycle. Engine friction. Detonation. Air capacity Fuel-air-cycle requirements. Carburetors. Spark ignition. Heat rejection and cooling. Compression-ignition engines. Two-stroke engines. Performance and supercharging. Index.

Note A readable, well-organized survey of the mechanical and thermodynamic principles and the basic mechanisms of internal combustion engines. It was designed as a textbook for engineering college students who are not preparing to specialize in internal combustion engines but need a general knowledge of them. It is useful also to graduate engineers with similar need. Suggestions for further reading are included, and there are 116 figures.

SCHWEITZER, PAUL HENRY

Scavenging of two-stroke cycle Diesel engines New York The Macmillan Company, 1949 268 p illus. 26 cm. $3 45 6087

Contents Present status of the Diesel engine. Peculiarities of the two-stroke cycle engine. Terminology *Effect of scavenging on* brake mean effective pressure. Scavenging arrangements. Porting. Inlet ports. Exhaust ports. Superchargers. Compression. Intake system. Exhaust system. The Kadenacy system. Complete porting calculation. High supercharging of two-stroke cycle engines. Experimental investigation of scavenging. Constructional features of representative two-stroke cycle Diesel engines. *Tabulation of porting data.* Bibliography Abbreviations. Index.

Note. The key to greater efficiency in two-stroke cycle Diesel engines lies in the improvement of scavenging, which is the removal of the products of combustion from the cylinder between the combustion and the recharging parts of the cycle. This book is a thorough discussion of scavenging and of scavenging systems. It deals with all of the problems in detail and describes systems and elements of systems which have been used in both experimental and commercial engines. It is written for engine designers who are already engaged in practical engine design. Portions of it were published in the periodical *Diesel power and Diesel transportation* in 1942 and 1943.

SORENSEN, HARRY A.
Gas turbines. New York. The Ronald Press Company 1951 460 p. illus. 23 cm. (A volume of a series in mechanical engineering, Burgess H. Jennings, editor) $7 00 6088

Contents: Introduction. Principles of thermodynamics. Simple open-cycle gas turbines. Variations of the basic cycle. Closed-cycle gas turbine plants. The axial-flow compressor. Centrifugal and positive displacement compressors. Axial-flow turbines. Combustion systems. Structural design. Plant performance. Miscellaneous plants. Appendix. Properties of air and combustion gases. Index.
Note: A well-rounded introductory exposition of gas turbine theory and current practice. The book is designed chiefly as college textbook for the use of upperclass engineering students. However, it is organized and written that it can serve equally well as a text book on the subject for engineers out of college who have the requisite knowledge of basic thermodynamic concepts and terminology. The whole range of gas turbine practice is covered from the gas turbines used in current aircraft to the largest stationary units.

TAYLOR, CHARLES FAYETTE, AND EDWARD S. TAYLOR
The internal combustion engine. Revised edition. Scranton. International Textbook Company 1948. 339 p. illus. 24 cm. (International textbooks in mechanical engineering) $6.75. 6089

Contents: Engine capacity and efficiency. The air cycle. Thermodynamics of the fuel-air mixture. Fuel-air cycles. Combustion in the spark-ignition engine. Detonation in the spark-ignition engine. Combustion in the compression-ignition engine. Direct heat losses. Mixture requirements of the spark-ignition engine. Fuels for the internal combustion engine. Engine friction. Lubrication and oils. Two-stroke engines. Air capacity of four-stroke engines. Engine performance. The gas turbine. Bibliography. Index.
Note: An engineering college text that has been planned for use of students who are preparing to work in engine research and design. Many of the experimental data have been derived from original work carried out by the authors at the Massachusetts Institute of Technology. The bibliography is extensive enough to be useful to engineers already at work in the field. The chapter on the gas turbine is new in this edition; and there are many minor changes throughout the text. The bibliography has been revised.

VINCENT EDWARD THOMAS
The theory and design of gas turbines and jet engines. New York McGraw Hill Book Company Inc., 1950 606 p. illus. 23 cm. $9.00. 6090

Contents: Some thermodynamic principles. Fundamentals of gas flow. Jet propulsion. Power plant cycles. Jet-propulsion devices. The turbine power plant. The fundamental principles of rotating machines. The centrifugal compressor. The design of centrifugal compressors. The axial-flow compressor. Design of axial compressors. Turbine theory. Turbine design. Combustion chambers, fuel systems, and fuels. Materials. Regenerators. Bibliography. Index.
Note: A textbook intended chiefly for upperclass undergraduates and graduate students in engineering schools. Its purpose is to present the theory which is essential to practical design of turbines and to relate this theory to the solution of specific design problems. The principles and characteristics of the chief types of gas turbines and jet units are described in engineering terminology including mathematical equations and graphs.

ATOMIC ENERGY AND REACTORS

BECKERLEY JAMES G editor
The Geneva series on the peaceful uses of atomic energy. Nuclear fuels. Edited by David H. Gurinsky and G J Dienes. Princeton, N J D Van Nostrand Company 1956 364 p. illus. 24 cm. $7.50. 6091

Contents: Part I. The metallurgy of uranium and thorium. The preparation of uranium metal. The physical metallurgy of uranium. The alloys of uranium. Casting and fabrication of uranium and its alloys. The production of thorium. The metallurgy of thorium and its alloys. Part II. Radiation effects: Basic considerations in radiation effects. The effect of radiation on structural materials. Radiation effects on fissionable materials. Part III. Solid and fluid fuels: The technology of reactor fuels. A uranium base fuel element (details of the fabrication of the Brookhaven fuel element). Dispersion type fuel elements. Fluid fuel systems. Additional chapter references. General bibliography. Subject index. Name index.

—— Exploration for nuclear raw materials. Edited by Robert D Nininger Princeton N J D Van Nostrand Company, 1956 293 p. illus. 24 cm. $8.00 6092

Contents: Part I. The geology of uranium and thorium. The natural occurrence of uranium in the United States. The genesis of uranium deposits. Uranium provinces. Influence of regional structure on uranium occurrence in western United States. Part II. Techniques of prospecting for uranium and thorium: Introduction—survey of prospecting techniques. Geologic prospecting. A systematic method of exploration for and evaluation of uranium deposits in France. Radiometric prospecting. Surface radiometric techniques. Aerial radiometric techniques. Geophysical prospecting. Geophysical-geochemical prospecting. Geochemical prospecting. Botanical prospecting. Hydrogeochemical prospecting. Exploration drilling. Subsurface radiometric techniques. List of conference papers. Subject index. Name index.
Note: Listed above are the titles and contents of the volumes published to the end of 1956 in this publisher's *Geneva series on the peaceful uses of atomic energy*, an edited selection of papers presented at the Geneva Conference. Some of the chapters in the volumes are taken from a single conference paper, but a number of them are made up of selections or complete texts of more than one paper. Two additional volumes in the series were published in 1957: *Nuclear reactors for research*, edited by C. K. Beck, 367 p., $8.50; *Nuclear [illegible] reactors*, edited by James K. Pickard, 333 p., $8.50. Also published in the United States of America, although the principal places of publication are in other countries, are *Progress in nuclear energy*, an edited selection in eight volumes, New York, Pergamon Press, and a complete collection in 16 volumes, *Proceedings of the International Conference on the Peaceful Uses of Atomic Energy*, Columbia University Press, 1955–56.

COMMONWEALTH EDISON COMPANY AND OTHERS
Reports to the U S. Atomic Energy Commission on nuclear power reactor technology by Commonwealth Edison Company Public Service Company of Northern Illinois Dow Chemical Company Detroit Edison Company Monsanto Chemical Company Union Electric Company Pacific Gas & Electric Company and Bechtel Corporation. Washington, D C. Government Printing Office 1953 88 p. illus. 23 cm. $0.25 6093

Contents: Introduction. Report on power generation using nuclear energy by Commonwealth Edison Co. and Public Service Co. of Northern Illinois: Gas-cooled reactor. Liquid-cooled reactor. Economics. Future requirements and possibilities. Conclusions. Study of materials and power-producing reactors, by Dow Chemical Co. and Detroit Edison Co.: Specifications for economical nuclear power. Discussion of specifications. Reactor types. Allowable investment in reactor. Reactor type of known technology considered. Plutonium-power reactor feasibility study, by Monsanto Chemical Co. and Union Electric Co.: Selection of reactor types for study. Description of first-choice reactor. Power plant. Economics of producing power in a combination power and plutonium-plant. Other aspects of the study. Developmental problems. Industrial reactor study, by Pacific Gas and Electric Co. and Bechtel Corp.: General considerations. Selection of reactor. Economic studies. Summary.
Note: The articles comprising this booklet are the declassified versions of reports made to the Atomic Energy Commission under agreements by four teams of nongovernmental industrial representatives. Beginning in 1951 these teams spent 12 months inside the

analysis. Internal-combustion-engine-process analysis. Deviations from ideal processes. Fuels. Combustion knock and knock rating. Carburetion and fuel injection. Manifolds and mixture distribution. Valves and valve mechanisms. Ignition of the charge. Combustion-chamber design. Engine lubrication. Heat transfer and engine cooling. Engine performance. Mechanics of principal moving parts. Engine vibration and balance. Engine design. Appendix. Index.

Note. A long-established engineering college textbook. Its coverage of specific topics, such as engine vibration and balance, is sufficiently inclusive to make the book useful to graduate engineers who find themselves in need of an introductory discussion. A special feature is the inclusion of charts that depict the results of numerous laboratory experiments and measurements on internal-combustion engines. Although this edition is a few pages shorter than the preceding edition, the work has been substantially revised. New material on such topics as throttling, supercharging, icing, and combustion-chamber design has been added.

MALEEV, V L

Diesel engine operation and maintenance, the construction, operation, maintenance, and repair of modern Diesel engines New York McGraw Hill Book Company, Inc., 1954 504 p. illus. 24 cm. $8 50 6082

Contents (abridged): Part I, Introduction General description and construction. Diesel-engine principles. Part II, Diesel-engine components Frames, cylinders, and heads. Running gear. Bearings. Flywheels. Valve gear. Fuel injection. Governors. Part III, Fundamentals of diesel engine work Fuels and combustion. Lubrication and lubricants. Engine cooling. Air-intake system. Exhaust system. Starting and reversing methods. Vibrations and balancing. Part IV Engine installation and operation Operating a diesel engine. Engine performance. Rating and testing. Part V Maintenance and repairs. Maintenance records and data. Engine overhauling. Special repairs and salvaging. Appendix. Glossary of terms used in diesel engineering. List of visual aids. Index.

Note. A well-written introductory text. In it, Diesel engine principles, mechanical elements and systems, operation, maintenance, and repairs are all treated in a descriptive style that requires on the part of the reader no previous acquaintance with engineering terminology and comprehension of only simple mathematics. There are numerous illustrations, and most of them are reproductions of line drawings of engine sections and parts. Both the narrative text and the illustrations have been chosen to impart a fairly detailed practical knowledge such as is needed by engine operators and repair men.

MALEEV, VLADIMIR LEONIDAS

Internal-combustion engines, theory and design Second edition. New York McGraw Hill Book Company, Inc 1945 636 p illus. 22 cm. $8 00 6083

Content (abridged) Principles of thermodynamics. Fuels. Combustion. Theoretical engine cycles. Combustion in spark-ignition engines. Combustion chambers of compression-ignition engines. Engine performance. Four-stroke engines. Two-stroke engines. Engine efficiencies. Four-stroke intake and exhaust. Supercharging. Two-stroke exhaust and scavenging. Cooling. Cylinders—cylinder heads. Reciprocating-rotary motion. Vibration and balancing. Lubrication. Crankshafts. Flywheels and governors. Starting—reversing. Rating—testing. Gas turbines. Index. Answers to even-numbered questions.

Note. A technical treatment used both as an engineering college textbook and as review for young design engineers. Familiarity on the part of the reader with thermodynamics and engineering mechanics is assumed, although the essentials of these subjects are briefly reviewed in the preliminary chapters. This edition is more than 200 pages longer than the first edition and includes newly added material on such subjects as fuels, combustion, and gas turbines. Pertinent literature is cited in occasional footnotes.

OBERT EDWARD FREDERIC

Internal combustion engines analysis and practice. Second edition Scranton International Textbook Company 1950 596 p illus. 23 cm $8 75 6084

Contents Basic engine types and their operation. Engine testing. Thermodynamics. Theories of combustion and detonation. Pressure and pressure measurement. Idealized cycles and processes. Combustion charts. Fuels. Knock and the engine variables. Exhaust gas and the air-fuel ratio. Carburetion. Injection. Engine characteristics and valve timing. Spark-ignition engines. Compression-ignition engines. Lubrication. Compressors, gas turbines, and jet propulsion. Appendix. Index.

Note: A standard textbook for use in engineering colleges. Basic phenomena and principles are discussed rather thoroughly. Engine types and systems are described, but the author has not attempted to include descriptions of specific makes of engines. The discussion of selected topics—of which fuels is an example—is full enough to be useful to graduate engineers reading outside the field of their own specialty. The first edition of the book was written by Burgess Jennings and the present author. Much new material has been incorporated in this second edition.

POLSON, JOSEPH ALBERT

Internal combustion engines. Second edition. New York John Wiley & Sons, Inc., 1942 548 p illus. 23 cm. $6 00 6085

Contents Internal combustion engines—general discussion. Fuels. Combustion. Ideal engine cycles; constant specific heats. Ideal engine cycles variable specific heats. Gas engines. Automobile engines. Carburetors. Electric ignition. Valves and cams. Airplane engines. Diesel engines. Superchargers. Combustion chambers. Diesel fuel injection. Engine cooling. Gas turbines. Appendix. Index.

Note: A college textbook for junior or senior mechanical engineering students, describing the various cycles and types of engines in general use today A thorough knowledge of fundamental thermodynamics is assumed. In developing the subject each cycle is first described and illustrated. Theoretical development is then discussed both by the air standard constant specific heat method and by the variable specific heat method. Performance is presented and analyzed, and typical examples and problems are given. The second edition presents approximately 100 pages of new material on such subjects as specific heats of gases, cams, air cooling, aircraft engines, and gas turbines, plus new data in the appendix.

ROGOWSKI, A. R

Elements of internal-combustion engin New York McGraw Hill Book Compan Inc., 1953 234 p illus. 23 cm. $6 00 60

Contents. Introduction. Physical principles. The air-cycle approximation. The fuel-air-cycle approximation. The actual cycle. Engine friction. Detonation. Air capacity Fuel-air requirements. Carburetors. Spark ignition. Heat rejection and cooling. Compression-ignition engines. Two-stroke engines. Performance and supercharging. Index.

Note. A readable, well-organized survey of the mechanical and thermodynamic principles and the basic mechanisms of internal combustion engines. It was designed as textbook for engineering college students who are not preparing to specialize in internal combustion engines but need a general knowledge of them. It is useful also to graduate engineers with a similar need. Suggestions for further reading are included, and there are 116 figures.

SCHWEITZER, PAUL HENRY

Scavenging of two-stroke cycle Diesel engines. New York The Macmillan Company 1949 268 p illus. 26 cm $3 45 603

Contents. Present status of the Diesel engine. Peculiarities of the two-stroke cycle engine. Terminology Effect of scavenging on brake mean effective pressure. Scavenging arrangements. Porting. Inlet ports. Exhaust ports. Superchargers. Compressors. Intake system. Exhaust system. The Kadenacy system. Complete porting calculation. High supercharging of two-stroke cycle engines. Experimental investigation of scavenging. Constructional features of representative two-stroke cycle Diesel engines. Tabulation of porting data. Bibliography Abbreviations. Index.

Note. The key to greater efficiency in two-stroke cycle Diesel engines lies in the improvement of scavenging, which is the removal of the products of combustion from the cylinder between the combustion and the recharging parts of the cycle. This book is a thorough discussion of scavenging and of scavenging systems. It deals with all of the problems in detail and describes systems and elements of systems which have been used in both experimental and commercial engines. It is written for engine designers who are already engaged in practical engine design. Portions of its text were published in the periodical *Diesel power and Diesel transportation* in 1942 and 1943.

ed heat generation. Pumps. Valves. Instrumentation. Combustion [illegible] Long Camp. v. Safety and fire protection, edited by R. K. [illegible] vi. [illegible] sodium. Radioactive sodium. vi. Applications, [illegible] by C. B. Jackson: Castle project. MSA high temperature [illegible]. Experimental breeder reactor (EBR) heat transfer ex[illegible]. Index.

Note Although termed [illegible] third edition of the *Liquid-metals* [illegible], the supplement here described is [illegible] new publication and [illegible] of the second edition of the same title, described [illegible] 7143 in our 1948–52 supplement. It is concerned with [illegible] of sodium and sodium-potassium alloy [illegible] NaK) as high-temperature heat-transfer media. [illegible] connection with atomic reactors. Since practical ex[illegible] large-scale liquid-metal work has been chiefly with [illegible] two elements, and since [illegible] significant amount of experi[illegible] data and analyses in this field was primarily applicable [illegible] and NaK, [illegible] was deemed advisable to devote the third [illegible] to these two substances. Some 30 different authors [illegible] the volume's contents, and the [illegible] chapters include [illegible] references.

ROCKWELL, THEODORE, III
Reactor shielding design manual. Princeton, N. J. D. Van Nostrand Company Inc. 1956. 472 p. illus. 27 cm. $6.00. 6099

Contents: Introduction and outline of basic shielding theory. [illegible]. Shielding the reactor core. Shielding the reactor cooling system. Plant layout and other factors [illegible] total shield design. Shield engineering. Radioactivity of [illegible] (the accessibility problem). Effect of [illegible]. Effect of geometry on radiation. Basic data. Index.

Note: Procedures and data used in the design, construction and testing of nuclear reactors for the production of power, particularly [illegible] pressurized water reactor built for the Shippingport, Pennsylvania, plant, and reactors built under the Naval Reactors Program of the United States National Government are described in this book. A wide range of engineering data and information not previously [illegible] is covered. The book was first issued as [illegible] document of the United States Atomic Energy Commission, but in this trade edition [illegible] preface and [illegible] detailed index [illegible] which does not appear [illegible] original edition.

SCHULTZ, M. A.
Control of nuclear reactors and power plants. New York, McGraw Hill Book Company Inc., 1955 313 p. illus. 24 cm. (McGraw-Hill series in nuclear engineering Walter H. Zinn, consulting editor) $7.50 6100

Contents: Introduction. Elementary physics of reactor control. Reactor kinetics. Automatic reactor control. Reactor control mechanisms. Nuclear power plant control. Reactor control radiation detection. Operational control problems—Startup—power operation—[illegible]. Simulation. Index.

Note: In this book, the control of nuclear reactors is studied as [illegible] control system design rather than as [illegible] problem in reactor engineering. The author has assumed on the part of his readers [illegible] basic knowledge of reactor physics, and the one chapter [illegible] the topic [illegible] essentially an outline useful as review. In accordance with the basic approach of the book, only the solid-fuel heterogeneous type of reactor is considered in relation to control problems, but theory and design considerations have been developed [illegible] way that enables the practical engineer to adapt the material [illegible] other types of reactors. The four chapters on operational control problems present specific problems in operation from the standpoint of automatic control. The chapter on simulation deals with [illegible] kind of special purpose computing machine which has proved useful in the study and solution of problems in the design of reactor control. The book is suitable for use as [illegible] text in graduate courses and as self-instruction for graduate engineers [illegible] who are making their first acquaintance with the control of nuclear reactors.

SOODAK, HARRY AND EDWARD C CAMPBELL
Elementary pile theory New York John Wiley & Sons, Inc. 1950 73 p. 23 cm. $3 90 6101

Contents: Cross sections. Slowing down of neutrons. Slowing-down density. Slowing down with absorption. Introduction to diffusion theory. Solution of diffusion equations—boundary conditions. The albedo. Space distribution of slowing-down density. The pile equations—solutions. Critical pile dimensions for simple pile shapes. The neutron cycle. Pile with reflector—group theories. Two-group theory. Pile control. Time-dependent pile equations. Pile kinetics—transient behavior. Index.

Note A brief presentation of knowledge pertaining to the design and the phenomena of radioactive piles constructed for the production of radioactive isotopes and fissionable elements. It is based on [illegible] series of lectures [illegible] which were delivered by Dr. Soodak in connection with [illegible] training program for staff members [illegible] the Oak Ridge National Laboratory (Clinton Laboratories) during 1946 and 1947. Only the declassified portion of the lectures is contained in the book, but this portion is potentially useful to graduate physicists and other scientists in need of [illegible] basic outline.

STEPHENSON RICHARD
Introduction to nuclear engineering New York McGraw Hill Book Company 1954 387 p. illus. 24 cm. $8.50 6102

Contents: Nomenclature and abbreviations. Review of [illegible] physics. Nuclear fission. The nuclear chain reactor. Reactor theory. Reactor instrumentation and control. Radiation shielding. Materials of construction. The separation of stable isotopes. Chemical separations and processing. Special techniques of [illegible] engineering. Appendix. Index.

Note: A textbook suitable for use by engineering college students [illegible] who have completed the basic engineering courses, and by engineering graduates [illegible] who wish [illegible] general introduction to this special field preparatory to work in reactor design or some other branch of nuclear engineering. Except for the first two chapters, [illegible] which are brief reviews of the fundamental theory and phenomena of nuclear physics and [illegible] fission, it is devoted entirely to the special problems and techniques of the design and operation of nuclear reactors and their accessory systems. Such aspects as radiation shielding are covered both descriptively and analytically. Instrumentation and also special devices, such as scanning periscopes and [illegible] manipulators, are well covered. Selected references to released Atomic Energy Commission reports and other pertinent literature are supplied as footnotes.

THOMPSON A. STANLEY AND OLIVER E. RODGERS
Thermal power from nuclear reactors. New York John Wiley & Sons Inc., 1956 229 p. illus. 24 cm. $7.25 6103

Contents: Nuclear considerations. Reactor equations and critical mass. Reactor kinetics. Shielding of reactors. Reactor materials. Thermal stress. Power extraction from reactors. Thermal power cycles. Index.

Note: An authoritative book on the engineering of [illegible] reactors designed for the production of power. It is primarily an analytical treatment although, necessarily there is some descriptive matter in several of the chapters, notably in those on shielding and on materials. In addition to the engineering topics, some background topics in physics also are covered. For instance, there is an analysis of the "breeding" of fissionable materials in reactors. Reference information of the "handbook type" is absent. Selected literature references, mostly to other books, are supplied.

UNITED STATES. ATOMIC ENERGY COMMISSION
Research reactors. New York McGraw Hill Book Company Inc. 1955 442 p. illus. 27 cm. $6.50 6104

Contents: Light-water-moderated reactor: Type [illegible] Homogeneous—enriched fuel. Light-water-moderated reactor: Type II. Heterogeneous—enriched fuel. Light-water-moderated reactor Type III. Heterogeneous—enriched fuel. Light-water and oil-moderated reactor Heterogeneous—enriched fuel. Heavy-water-moderated reactor: Heterogeneous—enriched fuel. Graphite-moderated reactor: Heterogeneous—natural fuel. Appendix.

—— The reactor handbook. Volume 1 Physics. New York McGraw Hill Book Company Inc. 1955 790 p. illus. 27 cm. $12.00. 6105

atomic energy program appraising the prospect for private industrial participation in joint production of electric energy and fissionable material from reactors. Both technological and economic problems were examined and are appraised.

GLASSTONE, SAMUEL

Principles of nuclear reactor engineering. With the assistance of the following ORNL staff members E E Anderson, E P Blizard, W K. Eister, G E Evans, W H. Jordan, J A. Lane, N F Lansing, R. W Stoughton, W H. Sullivan, and J D Trimmer New York D Van Nostrand Company, Inc., 1955 861 p illus 24 cm $7 95 6094

Contents Scope of nuclear reactor engineering. Nuclear reactions and radiations. Reactor theory—the steady state—disturbance of the *steady state*. Nuclear reactor instrumentation. Control of nuclear reactors. Processing of nuclear reactor fuel. Nuclear reactor materials. Radiation protection. Shielding of nuclear reactor systems. *Thermal* aspects of nuclear reactor systems. Nuclear reactor design variables. Descriptions of nuclear reactors. Appendix. Index.

Note A textbook developed upon the recommendation of the American Society of Engineering Education Committee on Atomic Energy Education and sponsored by the United States Atomic Energy Commission. The author himself is a consultant to the AEC, and staff members of the Oak Ridge National Laboratory supplied much of the information which has been incorporated. A broad survey of the current state of reactor theory and engineering design is presented, except that knowledge not yet declassified is, of course, not included. No previous acquaintance with nuclear physics or reactor design has been assumed on the other hand the book is addressed to readers with substantial education in engineering.

GLASSTONE, SAMUEL, AND MILTON C EDLUND

The elements of nuclear reactor theory New York D Van Nostrand Company, Inc., 1952 416 p illus. 24 cm. $5 50 6095

Contents Nuclear structure and stability Nuclear reactions. Production and reactions of neutrons. The fission process. The diffusion of neutrons. The slowing down of neutrons. The bare homogeneous thermal reactor (sources determined by Fermi age theory) Homogeneous reactor with reflector—the group-diffusion method. Heterogeneous (natural uranium) reactors. Time behavior of bare thermal reactor Reactor control. General theory of homogeneous multiplying systems. Perturbation theory Transport theory and neutron diffusion. Index.

Note An introduction designed specifically for the instruction of graduate engineers and physicists who are preparing for practical work in connection with the design or operation of nuclear reactors. It was based upon the course of lectures originally given by M. C Edlund at the Oak Ridge School of Reactor Technology The first four chapters cover background information on nuclear reactions. The rest of the book is largely mathematical exposition of nuclear chain phenomena and reactions and of reactor control. Although not the first work for scientists and engineers in this field, it does contain range of information which was still classified when the earlier publications were written and therefore was not represented in them.

GOODMAN CLARK editor

The science and engineering of nuclear power Reading Mass Addison-Wesley Publishing Company, Inc. 1949–52 2 v illus. 27 cm $17 00 6096

Contents Volume I, Introduction to pile theory Fundamentals of nuclear physics, by R. D Evans. The fission process, by M. Deutsch. Neutron diffusion, by V F Weisskopf Nuclear chain reactions, by E. P Wigner Elementary pile theory by F L. Friedman. The application and experimental basis of pile theory by B. T Feld. Chemistry of the fission process, by C D Coryell. Control and operation of pile, by W J Ozeroff. Construction of nuclear reactors, by C. Goodman. Heat transfer by E. R Gilliland. Heavy elements and nuclear fuels, by J W Irvine, Jr Appendixes. Table of practice numbers. Loss of energy in elastic collisions. Neutron cross sections of the elements, by R. K. Adair. List of illustrations. Index. Volume II, Source materials for nuclear power, by R. D Parks. Isotope separation, by K. Cohen. Vacuum techniques in nuclear engineering, by F C. Armistead. Theoretical basis of some measurements useful in pile design, by F L. Friedman. Research in neutron physics at Chalk River by B. W Sargent. Calculation of neutron distribution in heterogeneous piles, by A. M. Weinberg. The concept of albedo in elementary diffusion theory by G. Placzek. Pile kinetics, by H. Soodak. Statistical aspects of pile theory by F de Hoffmann. Heat removal from nuclear reactors, by E. R. Gilliland and others. Rockets and other thermal jets using nuclear energy by Hsue-Shen Tsien. The shielding of nuclear reactors, by M. L. Goldberger Effects of radiation on materials, by A. O. Allen. Production of radionuclides, by J W Irvine, Jr Pile materials—metals, alloys and compounds, by A. R. Kaufmann. Health physics—instrumentation and hazard evaluation, by R. D. Evans. Future developments in nuclear energy by C. Goodman. Appendixes. Index.

Note The first volume of this work was originally published in 1947 and appeared in second edition in 1952. The second volume was published in 1949. The main change in the second edition of Volume I is in the addition of the third appendix, reprinted from *Reviews of modern physics, July 1950*. Both volumes are comprised of material that was presented in series of seminars at the Massachusetts Institute of Technology The style is advanced, and the books are addressed to graduate students and graduate engineers who have considerable preparation in mathematics and basic physics.

HAUSNER, HENRY H., AND STANLEY B ROBOFF

Materials for nuclear power reactors. Foreword by T Keith Glennan New York Reinhold Publishing Corporation, 1955 224 p illus 18 cm. $3 50 6097

Contents Introduction. Basic concepts of nuclear power reactors. Basic parts of a reactor Types of nuclear power reactors. Special material problems in nuclear power reactors. Nuclear fuels. Moderators and reflectors. Coolants. Control elements. Materials for reactor shielding. Special materials of construction. Special problems of radiation. Appendix Thermal neutron cross-section in barns for the elements and certain isotopes. Glossary of nucleonic terms. Index.

Note Although materials constitute the main topic of this book, enough information is included on other aspects of nuclear power reactors to make the book useful as a source of general information, especially on the engineering problems. No mathematics is used, and the style of even the most difficult sections is only semi-technical. References to other literature including research reports and journal papers, are given for the guidance of those readers who will need more technical discussions. The book is good one for engineers who wish to acquire quickly some knowledge of the specialized engineering problems presented by nuclear power reactors. Journalists, officials of insurance companies, executives in manufacturing firms and laymen who are interested in the problems and potentialities of this field also may find the book of interest.

JACKSON CAREY B , AND OTHERS, editors

Liquid metals handbook sodium—NaK supplement. Editor in-chief Carey B Jackson. Contributing editors R. R. Miller, R. C. Werner R. A. Tidball H E. Grantz, R. E. Lee. Sponsored by the Atomic Energy Commission and the Bureau of Ships, Department of the Navy Washington D C. Government Printing Office 1955 445 p. illus. 26 cm. $2 00 6098

Contents I, Properties, edited by R. R. Miller. Chemical properties. Physical properties. II, Fundamentals, edited by R. C. Werner Heat transfer Natural circulation. Forced circulation. Boiling. Condensation Chemical engineering Purity and purification. Inert gas. Leak detection. Liquid sodium-water reactions. Radioactive material transfer Behavior of sodium in graphite. III, System design, edited by R. A. Tidball Materials and fabrication. Flow characteristics. Thermal stress and thermal strain. Piping considerations. Thermal insulation. Operation and maintenance. IV Components, edited by H. E. Grantz. Heat exchangers

of water base by the research method, its standard D 908. The [illegible] of the pages are occupied by the appendixes, which have [illegible] stated above, and supply descriptions of test apparatus, and [illegible] for its operation and use. Diagrams and photographs of apparatus are included.

[illegible]HARDT, CHARLES H.

Domestic oil burners installation and servicing. New York, McGraw Hill Book Company 1951. 359 p. illus. 24 cm. $6.25 6112

Contents (abridged) High-pressure gun-type burners. Low-pressure gun-type burners. Rotary burners. Vaporizing burners. Determining the gallons-per-hour rate of the oil burner. Short methods of figuring gallons-per-hour rates for conversion installations. Combustion chambers. Installation of tanks and piping. Automatic oil-burner controls. Control systems. Zone control. Adjusting for higher combustion efficiency (CO₂ and stack temperature). Adjusting for higher combustion efficiency (draft). Firing the new oil burner. Customer problems. Excessive fuel-oil consumption. Servicing [illegible] oil-burners. Basic oil-burner service methods. [illegible]

Note: Men entering the oil burner servicing field and students preparing for [illegible] are the audience for this book. The chief types of oil burners, principal types of controls, and the [illegible] [illegible] are described practically and simply. There are many descriptions of the mechanisms of specific burners and controls, but the author has not attempted to describe the mechanisms of all such devices on the market. The book is based on [illegible] series of articles that appeared in the Sheet metal worker and the *Plumbing and heating journal* from 1947 to 1950.

CARMAN, E. P., AND OTHERS

Bibliography of Bureau of Mines investigations of coal and its products 1945 to 1950 by E. P. Carman, M. Opperman, S. Nishiyama, and L. Racoosin. Washington, D. C. Government Printing Office, 1954 60 p. 26 cm. (United States. Bureau of Mines. Bulletin 528) $0.40. 6113

Contents: General. Methods of sampling, analyzing, and testing: [illegible] Liquid. Gaseous. Occurrence, origin, microstructure, petrography, and classification. Physical and chemical properties of coal, [illegible] and ultimate analyses, calorific values, ash analyses and fusing temperatures, moisture and spontaneous heating; plastic properties, and minor and rare elements in coal. Gases and dusts: Origin, absorption, evolution, composition, sampling, and analysis. Inflammability and explosibility, including testing methods. Physiological effects, protective devices, and treatment. Mining, including [illegible] of [illegible] reserves: Ventilation. Explosions, mine fires, and their control. Explosives. Electricity, safety lamps, [illegible], and transportation. Mine safety. Mine water and [illegible]. Preparation—sizing, cleaning, drying, and briquetting, including testing methods. Storage, spontaneous heating, and oxidation of coal. Carbonization, including testing methods. BM-AGA and other test methods. High-temperature. Low-temperature. Coal [illegible]. Water gas, producer gas, other gases and blends. Synthetic liquid fuels from coal: Hydrogenation and products. Gas synthesis and products. Coke. Gas. Tar, light oils, and other coal [illegible]. Combustion. Industrial. Domestic. Boiler-water conditioning. Smoke abatement and air pollution. Economics and statistics. [illegible] Index of subjects. Index of authors.

Note: This bibliography [illegible] the fourth in [illegible] series. The three others cover the periods 1910-1935, 1935-1940, and 1940-1945, and were published respectively as Bureau of Mines Technical papers [illegible], [illegible], and [illegible]. These bibliographies list reports of investigations which have been published in printed or mimeographed form by the Government Printing Office or the Bureau of Mines and in articles by staff members published in books and periodicals. The 1945-1950 bibliography contains [illegible] total of [illegible] entries.

COWARD, H. F., AND G. W. JONES

Limits of flammability of gases and vapors. Washington, D. C. Government Printing Office, 1952. 155 p. illus. 26 cm. (United States. Bureau of Mines. Bulletin 503) $0.60 6114

Contents: Determinations of limits. Some theoretical considerations. Limits of individual gases and vapors. Limits of mixed flammable gases and vapors. Summary of limits of flammability. Bibliography. Index of authors cited. Index of subjects.

Note. The results of investigations of certain chemical and physical factors connected with the limitation and propagation of flame in different gases under various conditions are presented in this reference work. This is the fourth edition of it. It includes 133 different substances in the summary of flammability limits in air and in oxygen as compared with 26 in the first edition.

DE LORENZI, OTTO, editor

Combustion engineering a reference book on fuel burning and steam generation. New York Combustion Engineering Inc., 1947 1,025 p. illus. 23 cm. $7.50 $2.50 to libraries. 6115

Contents (abridged) Origin and production of coal. Stokers. Pulverizers. Pulverized fuel burners. Furnaces for coal firing. Burners and furnaces for liquid fuels. Burners and furnaces for gaseous fuels. Furnaces for wood refuse and bagasse. Fluid cycles. Steam generators. Marine boilers. Superheaters. Feedwater. Heat recovery equipment. Testing of steam generating units. Selection of equipment. Performance calculations. Instruments, controls and interlocks. Recovery units for pulp mills. Flash drying and incineration. Modern boiler manufacture. Steam tables. *Miscellaneous data.*

Note An encyclopedic survey of fuel burning and steam generation on an industrial scale. Enough historical data are given to place important developments in accurate perspective, but the text and illustrations are concerned chiefly [illegible] current practices. The book was written by 30 specialists on the staff of Combustion Engineering, Inc. There are many incidental references to this company's activities and products, but these do not detract from the usefulness of the book. The material is intended primarily for engineers and engineering students, and is therefore rather technical in nature.

FIELDNER, ARNO CARL AND W. A. SELVIG

Methods of analyzing coal and coke. Washington, D. C. Government Printing Office 1951 51 p. illus. 26 cm. (United States. Bureau of Mines. Bulletin 492) $0.50. 6116

Contents: Introduction. Preparation of laboratory sample with preliminary drying. Method of calculating and reporting analyses. Preparation of laboratory sample without preliminary air-drying. Relative merits of the two methods. Total moisture determination for lump coke. Methods of analysis. Determination of the calorific value of coal. Fusibility of coal ash. Tolerances. Determination of agglomerating index of coal. Classification of coals by rank. Determination of true specific gravity of coal and coke substance. Determination of apparent specific gravity. Shatter test for coke. Tumbler test for coke. Determination of free-swelling index of coal. Determination of agglutinating value of coal. Analysis of coal and coke ash. Determination of ferric oxide, ferrous oxide, and metallic iron in coal-ash slags and clinkers.

Note. Information is here provided on the methods currently used in the laboratories of the Bureau of Mines for analyzing coal and coke and determining their heating values.

GENERAL ELECTRIC COMPANY AIRCRAFT GAS TURBINE DEVELOPMENT DEPARTMENT

Properties of combustion gases, system CnH2n—Air New York McGraw Hill Book Company Inc., 1956 22 cm. 2 v $75.00 6117

Contents Volume I, Thermodynamic properties: Sources and accuracy. Symbols and definitions. Explanation of tables. Notes on interpolation. Applications. Thermodynamic properties. (Tables). Volume II, Chemical composition of equilibrium mixtures: Symbols and definitions. Explanation of tables of Volume II. Chemical composition of equilibrium mixtures. (Tables).

Note. In both of these volumes all but [illegible] small portion of the space is occupied by the tables. The [illegible] listed above represent, for the most part, prefatory material on symbols and directions for using the tables. In Volume [illegible] the tables provide data on the thermodynamic properties of fuel-air mixtures at temperatures ranging from 400° R. to 5000° R. and pressures from 0.01 to 30 atm. In volume II, data are given on the equilibrium chemical compositions for the same mixtures for [illegible] similar range of temperature and pressure. Source data on which the tables are based

Contents Section I, Reactor physics Experimental methods. Nuclear physics. Kinetic theory of neutrons. Reactor statics—theory and general results—experimental and numerical results. Reactor dynamics. Section II, Radiation shielding Sources of radiation. Permissible levels of radiation. Gamma-ray attenuation. Neutron attenuation. Geometry Ducts through shields. Heat generation in shields. Shield optimization with respect to weight. Shield materials. Appendixes. Index.

—— Volume 2, Engineering New York McGraw Hill Book Company, Inc., 1955 1,075 p illus. 27 cm $15 00 6106

Contents (abridged) Section I, Light and heavy-water-cooled systems Physical and thermodynamic properties of light and heavy water Heat transfer Steady-state heat removal. Transient generation and removal of heat. Thermal-stress analysis. Water decomposition. Fuel-element design. Section II, Liquid-metal-cooled systems Properties of liquid metal coolants. Heat-transfer correlations for liquid metals. Reactor cooling and power conversion cycles. Mechanical components and design considerations. Section III, Gas-cooled systems: Thermal cycles. Heat transfer and fluid flow for gases. Circulating systems. Radioactivity in coolants. Section IV Aqueous fuel systems General reactor characteristics. Properties of aqueous solution systems. Properties of aqueous slurry systems. Engineering design information. Section V Liquid-metal-fuel systems. Composition and properties of liquid metal fuels. Engineering design. Section VI, Fused-salt systems Composition of fused-salt systems. Properties of fused-salt systems. Section VII, Handling and control Remote handling. Remote viewing. Nuclear reactor instrumentation and control. Section VIII, Reactor designs Graphite-moderated heterogeneous reactors. Beryllium-oxide-moderated heterogeneous reactors. Light-water moderated heterogeneous reactors. Heavy-water-moderated heterogeneous reactors. Unmoderated heterogeneous reactors. Graphite-moderated homogeneous reactors. Light-water-moderated homogeneous reactors. Appendix. Index.

—— Materials General properties. Contributors Argonne National Laboratory [and others] New York McGraw Hill Book Company, Inc, 1955 610 p illus. 27 cm. $10 50 6107

Contents Functions of reactor materials. Aluminum and its alloys. Beryllia. Beryllium and its alloys. Beryllium carbide. Bismuth. Carbides. Cements and concretes. Graphite. Hydrides. Lithium and its alloys. Magnesium and its alloys. Molybdenum and its alloys. Nickel and its alloys. Plutonium and its alloys. Rare earths. Silicon carbide. Stainless steels. Thorium and its alloys. Titanium and its alloys. Tungsten. Uranium and its alloys. Vanadium and its alloys. Zirconium and its alloys. High-cross-section materials. Cobalt-base alloys. Appendix. Index.

—— Chemical processing and equipment. New York McGraw Hill Book Company Inc 1955 302 p illus 27 cm $6 00 6108

Contents Chemical processing of reactor fuel elements at the Idaho chemical processing plant Process. Plant facilities. Process equipment. Decontamination of equipment for maintenance. Analytical section of the Idaho chemical processing plant. Health physics at chemical processing plant. Costs. Laboratory equipment. Enclosures for radioactive operations. Viewing and optical equipment. Manipulators. Chemical equipment. Physical-measurement equipment. Machine tools. Materials-handling equipment. Decontamination and monitoring instrument arrangements. Irradiation facilities.

Note This set of volumes constitutes a basic library of declassified information on the design of atomic reactors for research and other peaceful purposes. All originated as AEC documents and were produced for presentation at the International Conference on Peaceful Uses of Atomic Energy This trade edition is a reprint of the original documents without revisions or changes. *Neutron cross sections* was first published as an AEC document in 1952 The version included here is a second edition with not only the data in the first edition but additional data published in three supplements to it and also in BNL 250 originally a classified document now declassified.

FUELS AND COMBUSTION

AMERICAN SOCIETY FOR TESTING MATERIALS

Symposium on the significance of tests o coal Philadelphia The American Society f Testing Materials, 1937 125 p. illus. 22 cm (Reprint from *Proceedings* of the America Society for Testing Materials. Volume 3 part II, 1937) $1 50 610

Contents Interpretation of laboratory coal tests—proximate analysis and calorific value, by G. B. Gould. The significance to the consumer of sulfur in coal, by H. Kreisinger. The significance of ash softening temperature and ash composition in the utilization of coal, by A. W. Gauger Laboratory tests relating to coking, plastic, gas- and coke-making properties of bituminous coals, by O. O. Malleis. Significance of friability and size stability tests on coal, by R. E. Gilmore and J. H. Nicolls. Pulverizer performance as affected by grindability of coal and other factors by M. Frisch and A. C. Foster

Note: These technical papers are illustrated with charts and tables and each is followed by critical discussions.

ANDERSON, H. C., AND OTHERS

Bibliography of the Fischer Tropsch synthesis and related processes (in two parts) by H. C. Anderson, J L. Wiley, and A Newell. Washington, D C. Governmen Printing Office, 1954–55 965 p illus. 26 cm (United States. Bureau of Mines. Bulleti 544) Part I, $2 25, part II, $1 75 611

Contents Part I, Review and compilation of the literature on the production of synthetic liquid fuels and chemicals by the hydrogenation of carbon monoxide Introduction. Journal references. Literature abstracts. Subject index. Part II, Patents: Introduction Patents. Subject index. Numerical patent index.

Note A bibliography prepared at the Bureau of Mines to meet the needs of investigators in the field of chemistry of carbon monoxide. An abstract accompanies each entry There are 4,771 entries in the first part and 4,017 entries in the second part. Covered are writings on the history development, and commercial application of the Fischer Tropsch synthesis and related processes for the hydrogenation of carbon monoxide and the production of synthetic fuels and chemicals. Books, articles, reports, and patents in all languages are included. All titles and abstracts are rendered in English. The years of publication covered are 1919 through 1951, with some inclusion of 1952 in the first part and 1911 through 1953 in the second part.

ASTM MANUAL FOR RATING MOTOR FUELS AND MOTOR AND RESEARCH METHODS. Philadelphia American Society for Testing Materials, 1956 180 p. illus. 24 cm. $6 75 6111

Contents (abridged) Methods. Appendix I, Apparatus: Cooling and ventilation. Engine dimensions. Cylinder assembly Electrical system. Exhaust, fuel supply and induction systems. Detonation meter. Lubrication and crankcase. Power absorbing unit. Thermometers. Appendix II, Reference materials and blending accessories. Handling and blending of fuels. Handling and blending tetraethyllead. Reference material specifications. Suppliers. Appendix III, Operation. Appendix IV Maintenance Inspections. Cylinder assembly Crankcase. Lubrication. Induction and exhaust systems. Fuel system. Electrical system. Power absorbing unit. Instruments. Tolerances. Appendix Installation and assembly: Cooling and induction systems. Fuel and oil lines. Instruments and exhaust systems. Checking installation. Appendix VI, Building and utility requirements: Laboratory Engine foundation and service lines. Working conditions.

Note. The chief purpose of this manual is to guide engineers and technicians in the installation and operation of knock testing equipment for motor fuels. The first 28 pages are devoted to the introduction and to the current revisions of the American Society for Testing Materials' "Standard method of test for knock characteristics of motor fuels by the motor method," its standard D 357, and the Society's "Standard method of test for knock characteristic

[illegible] the results of an experimental investigation of detonation [illegible] as applied to metal in the [illegible]. The object of [illegible] was to determine the influence of various [illegible] parameters on the dynamic properties of [illegible] [illegible] [illegible]. Experimental techniques [illegible] and [illegible] of the apparatus are included.

NATIONAL RESEARCH COUNCIL. COMMITTEE ON CHEMICAL UTILIZATION OF COAL. DIVISION OF CHEMISTRY AND CHEMICAL TECHNOLOGY

Chemistry of coal utilization prepared by the Committee on Chemical Utilization of Coal, Division of Chemistry and Chemical Technology H. H. Lowry chairman. New York: John Wiley & Sons, Inc., 1945 2 v. [illegible] cm. $25.00 per set. 6124

Contents (abridged): Volume 1: The origin of coal, by T. A. Bench. Coal petrography, by G. H. Cady. Calorific value of coal, by [illegible] and [illegible]. Hardness, strength, and grindability of coal, by R. F. Yancey and M. R. Geer. Plastic, agglomerating, and swelling properties of coals, by R. [illegible]. Chemical constitution of coal—as determined by [illegible] methods, by J. F. Weiler. Chemical constitution of coal—[illegible] by reduction reactions, by J. F. Weiler. Forms of [illegible], by G. Thiessen. Composition and origin of the [illegible], by G. Thiessen. The cleaning of coal, by R. F. Yancey and M. R. Geer. Changes in coal during storage, by [illegible]. [illegible] distillation of coal, by H. C. Howard. [illegible] and carbonization, by F. Denig. The physical properties and [illegible] of coke, by Martin A. Mayers. Volume 2: Gas from [illegible], by A. R. Powell. Removal of sulfur compounds from coal gas, by H. A. [illegible]. Recovery of ammonia, cyanogen, [illegible], and other nitrogenous compounds from industrial gases, by [illegible]. Light oil from coke-oven gas, by [illegible]. [illegible] of coal gas, by L. Shnidman. The chemical [illegible] of coal tar, by [illegible]. Direct generation of electricity from coal and gas (fuel cells) by H. C. Howard. Producer and [illegible] gas, by [illegible] C. van der Hoeven. Water gas, by J. [illegible]. Hydrogenation of coal and tar, by H. H. Storch. Synthesis of hydrocarbons from water gas, by H. H. Storch. [illegible] synthesis from water gas, by [illegible]. Author index. Subject index.

Note: A collection of 42 papers written by 35 specialists, several of whom are associated with the Koppers Company, the Mellon Institute, the U. S. Bureau of Mines, and the Carnegie Institute of Technology. Most of the papers are based on the literature published through 1939, although there are some references to 1942 and 1943 publications. The literature pertinent to the subject of each paper is cited in footnote references. The work is intended [illegible] for fuel chemists.

SCHMIDT PAUL FRANK

Fuel oil manual. New York Industrial Press, 1951. 160 p. 23 cm. $3.50 6125

Contents: Introduction. Chemistry of petroleum. Petroleum refining processes. Grades and types of fuel oils. Gravity. Heat of combustion. Viscosity. Water and sediment. Carbon. Ash and salt water. Flash and fire points. Pour point. Sulphur. Color. Distillation. Pumping of oils. Sampling storage tanks. Stability of fuel oils. Fuel oil treatments. Reclaimed fuel oils. Blending of oils. Temperature and storage. Fuel oil specifications. Complaints and [illegible]. Index.

Note: A compilation of useful and clearly stated information for [illegible] engineers and other persons who are concerned with purchasing or burning fuel oil. The book is by no means exhaustive, but [illegible] practically all of the information that may be needed by purchasing agents, building superintendents, and engineers responsible for the handling of fuel oil in large heating installations and power plants. There are 34 tables of data on such matters as temperature volume corrections, [illegible] and [illegible] viscosity [illegible], heating values in relation to A.P.I. gravity, salt content of fuel oils, fuel oil additives, and fuel oil specifications.

SHNIDMAN LOUIS, editor

Gaseous fuels properties, behavior and utilization. Second edition, revised, corrected and enlarged. New York American Gas Association, 1954 453 p. illus. 28 cm. $6.00. 6126

Contents: The gas industry. The basic gas laws. Types of fuel gases. Physical properties and measurements. Components and properties of fuel gases. Applications of gas analyses. Atmosphere gas burners. Interchangeability of fuel gases. Controlled furnace atmospheres. Purging—principles and operating practices. Combustion products—flue gases. Deposits—distribution systems and appliances. Air and other atmospheres. Some recent technical developments. Selection of oils for gas production. Research in the gas industry. Appendix. Index.

Note: Essentially a reference book, this work is organized in such a way that it can be used also as a textbook in courses offered to graduate engineers and technicians who are concerned with the use of gaseous fuels in industry. A large amount of explanatory text is combined with a wide range of data presented in the form of graphs and tables. Extensive references are made to the literature. The first edition under this title was published in 1948. The second edition represents an extensive revision and augmentation which involved not only the correction of errors and the revision of tables and other representations of data to bring them up to date, but also the addition of four chapters and numerous tables. Literature references are included.

SMITH MARION L. AND KARL W STINSON

Fuels and combustion. New York McGraw Hill Book Company Inc., 1952 340 p. illus. 24 cm. $7.50. 6127

Contents: Fuels. Stoichiometric analysis. Thermochemical analyses. The process of combustion. Physical properties of fuels. Gas and oil burners. Coal-burning equipment. Combustion in engines. Index.

Note: A college textbook in which is combined a description of the common fuels, an exposition of the chemical and physical bases of combustion, and descriptions of the chief fuel-burning devices including internal combustion engines. The authors have assumed familiarity with basic engineering and chemical terminology and with elementary engineering mathematics on the part of their readers. Problems for the student to solve and literature references are included. The authors are members of the faculty of Ohio State University.

SPALDING D B

Some fundamentals of combustion. New York Academic Press, Inc., 1955 250 p. illus. 25 cm. (Gas turbine series general editor James Hodge. Volume 2) $7.50 6128

Contents: Thermodynamics. Fluid flow. Heat and mass transfer. Heat and mass transfer with chemical reaction. Chemical effects in combustion. Engineering applications. References. Index.

Note: This book is an intermediate-level introduction to the fundamental aspects of combustion and of heat and mass transfer. It is addressed to graduate engineers and to advanced students pursuing courses which lead to practical engineering design. Although the basic phenomena and relationships of thermodynamics are outlined in the first chapter readers need some previous education in thermodynamics. It has been published in a series dedicated to the gas turbine; however the viewpoint is broad and basic, and much of the expository matter pertains generally to combustion and to heat and mass transfer phenomena. The still incomplete knowledge of combustion processes is well covered in the fourth and fifth chapters. The final chapter on engineering implications is an outline of design considerations and experimental methods. The list of references runs to seven pages and includes literature published as recently as 1954.

STEINER, KALMAN

Oil burners. Second edition. New York McGraw Hill Book Company Inc., 1950 502 p. illus. 23 cm. $6.50. 6129

Contents: Hydrocarbons and petroleum. Fuel oil. Combustion of fuel oil. Comparative fuel data. Problems of oil-burner design. Shell- and pot-type burners. Domestic oil burners. Horizontal-rotary burners. Industrial oil burners. Fans and electric motors. Electric control devices. Electric control systems. Ignition methods. Fuel-oil pumps. Oil piping, strainers, and flow regulators. Capacity of boilers and warm-air furnaces. Refractories. Draft and combustion

were taken from the U S. National Bureau of Standards, *Tables of selected values f chemical thermodynamic properties* 1945. Although prepared primarily for use by engineers concerned with the design of jet engines and the analysis of their behavior the tables have applications to other types of air-breathing, internal combustion engines also.

GRISWOLD, JOHN

Fuels combustion and furnaces. New York McGraw Hill Book Company, Inc., 1946 496 p illus 24 cm. $8 50 6118

Contents Coal and coke. Petroleum and natural gas. Mixture properties of petroleum fractions. Combustion stoichiometry Temperature, enthalpy and heat of combustion. Equilibrium and kinetics. The combustion process. Manufactured gas. Gas burners. Oil burners. Stokers and pulverized coal burners. Introductory heat transmission. Furnace refractories. Firebox and chimney considerations. Tube heaters. Process furnaces and kilns. Appendix of data. List of visual aids. Author index. Subject index.

Note This book offers a clearly written survey of fuels and the equipment for utilizing them. The volume is intended chiefly for use as textbook by undergraduate students of chemical engineering, but it is also handy outline of the subject for graduate engineers who have not specialized in fuels. Each subject contains a list of references and review exercises.

HANDBOOK OF OIL BURNING Frank H. Faust, editor in-chief, G Theodore Kaufman editor New York Oil Heat Institute of America, 1951 978 p illus 24 cm $10 00 6119

Contents. Section I, Oil as a fuel. Section II, Combustion of fuel oil. Section III, Preparing oil for combustion. Section IV Oil burning equipment. Section V Elements of the heating system. Section VI, Controls. Section VII, Selection of equipment. Section VIII, Application, installation and maintenance f oil burners. Section IX, Standards. Biographies f authors and editors. Index.

Note A comprehensive work designed not only for the use of engineers but also for heating contractors and others with practical interest in oil burners and heating. In most parts, the presentation is less compact and considerably easier to understand than is typical of engineering handbooks. Detailed descriptions of the various types of oil burners, the various types of heating systems and of related matters such as the method of calculation f heat losses from building. Full directions are given for both the installation and maintenance of the various types of residential burners. Though the book's lineage includes the *Handbook of oil burning* published by the American Oil Burner Association in 1931 no matter has been carried over from that book.

HOTTEL, HOYT CLARKE, AND OTHERS

Thermodynamic charts for combustion processes. Part I and II by H C Hottel G C Williams and C. N Satterfield. New York John Wiley & Sons, Inc , 1949 2 v illus 29 cm. Part I, $3 15 part II $3 75 6120

Contents Part I, Text Introduction. The modified-air chart. The burned-mixture charts. Generalized thermodynamics charts. Appendix Basic thermodynamic data. References. Author reference index. Index. Part II, Charts Appendix II Some equilibrium gas compositions. Appendix III, Generalized thermodynamic data. Modified-air chart. Burned-mixture charts.

Note A reference book for engineers who are concerned with the combustion processes in gas turbine, jet propulsion unit, and rockets. In the text portion, the principles of cycle calculation are explained in detail. Older methods are reviewed, and new method devised by the authors is explained. Among the devices whose cycles are analyzed in the first part of turbo-compressor power plant, the compression ignition (Diesel) engine, the ignition engine (Otto cycle) the ram jet, and single- and two-fluid rockets. The second part contains, in addition to the appendix material, one chart for modified air and seven charts which show the proportions of products of combustion and other properties for various mixtures of hydrocarbons and air under various conditions of pressure.

JOHNSON, ALLEN JAQUITH editor

Fuels and combustion handbook. Editor Allen J Johnson, associate editor George H. Auth. New York McGraw Hill Book Company, Inc., 1951 915 p. illus. 24 cm. $15 00 612

Content (abridged) Section I, Solid fuels Fuel sources, trends and reserves in the United States and abroad. Pennsylvania anthracite and other anthracite coals. Bituminous coal, subbituminous coal and lignite. Peat, wood, wood wastes, charcoal, and agricultural wastes. Section II, Liquid and gaseous fuels and miscellaneous sources of heat and power Petroleum and petroleum derivatives. Gaseous fuels. Section III, Combustion Determination and calculation of heat balances. Drafts and chimneys. Smoke, fine particles and other combustion rejects, including slags. Section IV Selection of a fuel. Section V Preparation of coal for utilization. Section VI, Fuel-handling methods. Section VII, The transfer and generation of heat Heat transfer and insulation. Boilers and steam generators. Methods of firing solid fuels. Firing liquid and gaseous fuels. Some specific non-steam-making uses of fuel. Section VIII, General Boiler measurements and tests. Index.

Note. A handbook of interest in several fields. It provides in handy form not only wide range of data to engineers and operating personnel in powerplants but also much data on relatively minor fuel topics. Examples of the latter include information on the fuel value of bark and wet wood, description of the techniques of manufacturing briquettes and pellets from fine sizes of coal discussions of electric heating, solar heat, thermal springs, atomic energy and uses of fuel in the manufacture of metals, ceramic products, etc. There are footnote references to related literature but no attempt at a systematic bibliography

LEWIS, B , AND OTHERS, editors

Combustion processes. Editors B Lewis, R N Pease, and H. S Taylor Princeton Princeton University Press, 1956 662 p. illus. 25 cm. (High speed aerodynamics and jet propulsion. Volume II) $12 50 6122

Contents. Part I, Thermodynamics of combustion, edited by B. Lewis. High temperature equilibrium, by J. M. Carter and D. Altman. Expansion processes, by D Altman and J. M. Carter. Computational methods in combustion calculations, by S. R. Brinkley Jr Part II, Chemical kinetics of combustion, edited by H. S. Taylor and R. N Pease Fundamentals of chemical kinetics, by H. S. Taylor Kinetics of several oxidation reactions, by R. N. Pease. Part III, Flame propagation in gases, edited by B. Lewis. Mechanics of reaction continua, by J. M. Richardson and S. R. Brinkley Jr. Combustion waves in nonturbulent explosive gases, by B. Lewis and G. von Elbe. Combustion waves in turbulent gases, by B Karlovitz. Diffusion flames, by K. Wohl and C. W Shipman. Part IV Combustion of liquids and solids, edited by R. N Pease Combustion of liquid fuels, by J P Longwell. Combustion of solid fuels, by M. Gerstein and K. P Coffin. Combustion of liquid propellants, by D. Altman and S. S. Penner Combustion of solid propellants, by C. Huggett. Part V Detonation processes in gases, liquids, and solids, edited by R. N Pease. Part VI, Energy production by uclear reactions, edited by R. N. Pease. Index.

Note An authoritative presentation of knowledge on combustion processes, including some basic knowledge from general chemistry on such matters as equilibrium and chemical kinetics. Published in series devoted to high-speed aerodynamics and jet propulsion, it is particularly suitable for readers who have recently entered the field of jet engine research and design However its usefulness is not limited to this field, since the knowledge it contains is applicable in more or less degree to any chemical process involving combustion. The parts are not organized on set pattern, but generally speaking each one describes current theory refers to pertinent experiments, and cites the useful literature The final section is brief, expertly written essay on uclear reactions as source of energy

MORRISON, RICHARD BOYD

A shock tube investigation of detonative combustion Ann Arbor University of Michigan Press 1955 121 p. illus. 28 cm. (University of Michigan Engineering Research Institute. Special publications Reports) 6123
$3 50

Contents. Introduction. Theory of detonation processes. Analysis of detonation velocities. Shock tube theory as applied to detonative processes. Experimental equipment and instrumentation. Experimental results. Discussion. References. Bibliography

AMERICAN SOCIETY OF REFRIGERATING ENGINEERS

Air conditioning refrigerating data book applications volume. Sixth edition. New York: The American Society of Refrigerating Engineers, 1956. v p. illus. 24 cm. $10.00 6135

Contents (abridged): Frozen foods. Refrigeration in food industries. Refrigerated warehouse practice. Refrigerated food distribution. Low temperature applications. *Industrial applications of refrigeration.* Comfort air conditioning. Industrial air conditioning. Domestic ... air conditioning and refrigeration associations. Index.

Note: A well-prepared, comprehensive guide to the methods and ... of refrigeration as they are applied in a wide variety of fields, including air conditioning. It is directed to refrigerating engineers and others with technical interests in refrigerating and air conditioning. It contains both exposition and description ... style and tabular representation of data. In this edition, it is expanded in the eight principal sections whose titles are given above and in 60 chapters. The chapters have separate ... and the total number of pages is over 1,200. The names of editors responsible for the sections and of authors responsible for the chapters are given in the volume. Bibliographies and illustrations are included. Appended to the main part of the volume is a directory of refrigerating and air conditioning manufacturers, together with some advertising of such firms. A complementary volume, called the *Design* volume, is prepared and published by the same Society. The *Design* volume presents basic engineering ... and reference data pertinent to the design of refrigerating and air conditioning equipment and systems. It was published in ... edition in 1951, $10.00.

EMERICK, ROBERT HENDERSON

Basic refrigeration and air conditioning. New York, Prentice-Hall, Inc., 1948 259 p. illus. 24 cm. $4.25 6136

Contents: Terms and definitions. Refrigerants and how they act. Refrigeration by direct expansion. Refrigeration by ammonia and brine. Refrigeration by ammonia absorption. Refrigeration by the ... system. Spray ponds and cooling towers. Cold storage. Making ice—both wet and dry. Air conditioning—ways and means. ... Fans and ducts. Cabinet coolers. Refrigeration and air conditioning at sea. The heat pump. Making ... The ... chart. Bibliography. Index.

Note: A well-written, practical text which was originally designed ... to aid in training personnel of the United States Armed Forces, is ... suitable both for use in courses organized at the vocational ... level and as a self-instructing guide. The ... of the field and the basic theories are covered in the preliminary chapters, after which the space is devoted entirely to ... of refrigeration equipment and calculations that must be made in designing or selecting refrigeration systems. The chapters are supplemented by review questions, most of which are designed to illustrate practical refrigeration problems. The bibliography is ... for a book of this kind, and the entries are ...

JORDAN, RICHARD C AND GAYLE B PRIESTER

Refrigeration and air conditioning. Second edition. Englewood Cliffs, N J Prentice-Hall, Inc., 1956 555 p. illus. 24 cm. $8.00. 6137

Contents: Part I. Introduction. The history of refrigeration. Basic refrigeration cycles and concepts. Review of thermodynamics. Part II. Refrigeration cycle analysis and components: refrigeration ... Thermodynamics of vapor refrigeration. Refrigerants. Air cycle, ... and centrifugal refrigeration, and the heat pump. Components: refrigeration machines. Part III. Fluid flow, heat transfer, psychrometrics and their refrigeration applications. Fluid flow and heat transfer. Psychrometrics. Cooling load calculations. Condensers and evaporators. Refrigeration piping. Part IV. Advanced refrigeration topics. Multiple evaporator and compressor systems. Refrigeration control. Absorption refrigeration and chemical dehumidification. Low-temperature refrigeration. Part ... Refrigeration applications. Applications of refrigeration. Air conditioning. Food preservation. Appendix. Answers to problems. Index.

Note: A broad, practical view of refrigeration principles and applications is provided in this book. Some knowledge of basic physics and mathematics on the part of readers has been assumed. However mathematical analysis is not pursued beyond that required in ordinary refrigeration and air-conditioning engineering. Refrigeration cycles, mechanisms and principles and the applied mathematics used in the industry such as cooling-load calculations, are all clearly explained. The full range of applications of refrigeration machinery is covered, including relatively recent developments such as heat pumps for residential heating, cooling systems for passenger aircraft, and even the Collins helium cryostat. The first edition was published in 1948. The new material in this second edition covers new machinery and also some new basic information such as a description of calorimeter performance test. Literature references have been revised to include recent publications. New illustrations have been added and the number of tables increased.

KING GUY R.

Basic refrigeration principles practice, operation a simplified presentation of the fundamentals of refrigeration giving equal treatment to all common refrigerants. Design operation and servicing of the apparatus and system. Chicago Nickerson & Collins Company 1951 526 p. illus. 24 cm. $6.00. 6138

Contents: Fundamentals. Compression system of refrigeration. Refrigerants. Expansion valves. Evaporators. Compressors. Condensers. *Flow equipment. Electric controls and control valves. Lubrication.* Defrosting methods. Compressor drives. Food preservation. Operating. Servicing. Refrigerated cabinets. Instruments and meters. Heat calculations. Humidity in refrigeration. Compressor calculations. Refrigerant line—pressure drops. Brine in refrigeration. Liquid cooling. Complete systems. Carbon dioxide—dry ice. Altitude and its effect. Absorption systems. The refrigeration cycle. Appendix: Tables. Calculating overall heat leakage factors. Answers to problems in questions. Index.

Note: An introductory textbook designed for use in vocational schools and for home study by men interested in the trade of installing and maintaining refrigerating systems. Although both commercial installations and small household refrigerators are discussed, the larger systems are emphasized. The types and properties of refrigerants, the elements of refrigerating systems, such as condensers, and special problems, such as the exclusion of moisture from insulation, are all discussed clearly. Typical calculations are worked out. Numerous helpful tables of data are included.

MCCORMACK, ALEXANDER A.

Cold logic (refrigeration principles) Chicago Nickerson & Collins Company 1949 212 p. illus. 24 cm. $3.50. 6139

Contents. The "how" and "how much" of heat. Refrigeration as the removal of heat. The refrigeration cycle. The story of refrigerants. *Evaporators (often called coils or boilers)* Lubrication. Compressors. Condensers, receivers, interchangers and valves. Insulation. Introduction to air conditioning. Air conditioning calculations. Electricity's contribution to refrigeration. Applying theory to service work. *Topical index. Index to illustrations.*

Note: A self-instruction aid for men working in the refrigerating maintenance trade. The author endeavors to make the principle of refrigeration and the behavior of refrigerating machines clear to such readers. His explanations are clear without being oversimplified. Each chapter is supplemented by review questions and helpful discussions of them. The book is a useful supplement to full-scale introductory texts and to the service manuals issued by manufacturers.

MACINTIRE, HORACE JAMES AND F W HUTCHINSON

Refrigeration engineering. Second edition. New York John Wiley and Sons Inc., 1950 610 p. illus. 23 cm. $7 95 6140

Contents (abridged). Part I. Thermodynamics of reversed cycles. Energy relationships in refrigeration. Simple refrigeration cycles. Thermodynamic refinements of the simple refrigeration cycle. Special systems—the heat pump. Absorption and adsorption systems—

control. Oil preheating. Oil storage tanks and gauges. Service and maintenance. Control of the heating system. Appendix. Index.

Note A comprehensive survey of practical and engineering aspects of oil fuel and oil burners. A wide range of equipment is described, but the descriptions are incidental to the presentation of fundamental principles and data. Both residential and industrial burners are covered, but somewhat more attention is given to industrial types. Although the book contains material of interest to oil burner repairmen, it appeals particularly to engineers and power plant supervisory personnel. It is also useful as a reference book for architects, builders, and others who need technical information. The present edition represents a thorough revision.

SYMPOSIUM (INTERNATIONAL) ON COMBUSTION, 5TH

Fifth symposium (international) on combustion combustion in engines and combustion kinetics. At the University of Pittsburgh, Pittsburgh, Pennsylvania, August 30–September 3, 1954 Published for the Combustion Institute, under the auspices of the Standing Committee on Combustion Symposia. New York Reinhold Publishing Corporation, 1955 802 p illus 26 cm. $18 00 6130

Contents (abridged): Review of problems on combustion in engines and kinetics of combustion processes. Combustion of fuel droplets. Propellant burning. Combustion of solids. Diffusion flames and carbon formation. Combustion in engines. Special techniques. Kinetics of combustion reactions. Flame spectra and dissociation energies. Panel discussions.

Note. The number of papers in the various sections of this volume—the titles of which are given above—are first section, eleven papers second section, six, third section, nine fourth section, six fifth section, five; sixth section, eight seventh section, five eighth section, 43; and ninth section, six. Obviously the greater attention was given to the kinetics of combustion however the other sections also deal with important areas of present-day combustion research and are at least of equal interest to scientists and engineers working in this field. The book is concluded with condensed transcripts of two panel discussions devoted to (1) heterogeneous burning and (2) current status of the theory of the kinetics of combustion reaction. Literature references are included for the majority of papers. There is no volume index to either subjects or authors.

TRINKS, W

Industrial furnaces Volume I, fourth edition. Volume II, third edition. New York John Wiley & Sons, Inc. 1951–55 2 v illus. 23 cm. Vol I, $12 75, vol II, $10 00 6131

Contents: Volume I Introduction. The heating capacity of furnaces. The fuel economy of furnaces. Heat-saving appliances with particular reference to industrial furnaces. Strength and durability of furnaces. Movement of gases in furnaces. Appendices. Index. Volume II Introduction. Fuels and electric energy Combustion devices and heating elements. Control of furnace temperature. Control of furnace atmosphere. Labor-saving appliances. Critical comparison of fuels and of furnace types. Safety measures. Index.

Note. The outstanding American work on the design of industrial furnaces for such purposes as heat-treating and annealing of metals. Furnaces for the melting of metals are not included. Methods of calculating heat capacities and heat losses are covered in detail. Fuels, combustion devices, controls, and auxiliary equipment, such as conveyors for the materials to be treated in the furnaces, are covered with equal thoroughness. There are several hundred illustrations, including graphical representations of data, diagrams of furnace structures and elements, and photographs of complete furnaces. The two volumes may be used independently of one another A current set consists of the editions listed here.

TURNER, C C

The bottled gas manual. Philadelphia The Chilton Book Company, 1944 356 p illus. 23 cm. $6 00 6132

Contents: What is propane? The behavior of gases. Heat and temperature. What goes on within a propane cylinder The simple regulator. Regulator manifolds. Regulators—equipment selec and installation. LP-gas pipe lines. Testing for leaks and adj ing burners. Fundamentals of thermostats. Pilots and pilot c trols. Burner design and application. Appliance conversions. F about water and water heaters. Types of water heaters. Selec and installing the water heater. Competitive fuels—wood. C petitive fuels—coal. Competitive fuels—oil. Competitive fuel electricity—rates and refrigeration. Competitive fuels—electricity cooking and water heating. Gas lighting. Space heating. Conclus Index.

Note A detailed field guide for service men, salesmen, engineers, giving accurate information and data on approved me ods and processes of selling, installing and servicing liqu petroleum gas equipment and appliances. Deals particularly w the propane branch of the industry but is largely applicable the butane branch also.

UNITED STATES BUREAU OF MINES

Bibliography of Bureau of Mines investi gations of coal and its products, 1945–195 By E. P Carman, M Opperman, S. Nish yama, and L. Racoosin Washington, D C Government Printing Office, 1954 60 p. 2 cm. (United States. Bureau of Mines. Bu letin 528) $0 40 613

Contents. General. Methods of sampling, analyzing, and testi Occurrence, origin, microstructure, petrography and classificati Physical and chemical properties of coal proximate and ultima analyses, calorific values, ash analyses. Gases and dusts. Mini including investigations of minable reserves. Mine water and cor sion. Preparation: Sizing, cleaning, drying, and briquetting, includi testing methods. Storage, spontaneous heating, and oxidation of co Carbonization, including testing methods. Coal gasification: Wat gas, producer gas, other gases and blends. Synthetic liquid fu from coal. Coke. Gas. Tar Light oils, and other coal chemical Combustion. Smoke abatement and air pollution. Economics a statistics. Motion-picture films. Index of subjects. Index of autho

Note. A classified bibliography of publications including not onl printed and mimeographed publications issued by the Governmen Printing Office or the Bureau of Mines and articles by staff membe of the Bureau of Mines published in professional journals and i books. It is part of a continuing series which covers Bureau o Mines investigations of coal and its products since the Bureau wa established in 1910.

REFRIGERATION

ALTHOUSE, ANDREW D, AND CARL H. TURNQUIST

Modern refrigeration and air conditioning. Chicago The Goodheart Willcox Company, Inc. 1956 756 p illus. 24 cm $7 45 6134

Contents: Fundamentals of refrigeration. Refrigeration materials, service tools. The compression system. Compressor construction. Refrigerant controls. Motor controls. Electric motors. Refrigerants. Domestic refrigerator cabinets. Conventional compression systems. Servicing conventional systems. The refrigerator service shop. The absorption system. Absorption systems, construction features. Servicing absorption systems. Hermetic units. Servicing hermetic systems. Commercial refrigeration applications—systems, mechanisms—installation, servicing—calculations, heat loads. Air conditioning principles. Air distribution instruments. Heat loads. Air conditioning systems and controls. Heat pumps. Automobile air conditioning. Frozen food refrigerators. Technical characteristics. Answers to review questions. Index.

Note. A successor to the authors' *Modern electric and gas refrigeration*, fifth edition, 1950. Although it has been so extensively rewritten that publication under new title is justified, its purpose has not been changed. In its new form, it is still practical and suitable for use in vocational school classes and for the guidance of men who get into the work of maintaining and repairing refrigerators without formal education in the field. The thermodynamic fundamentals of refrigeration are presented in a simple, nonmathematical style. Then the elements of refrigerating systems, complete systems of various types, and applications of refrigeration are described in detail from the practical viewpoint and with emphasis on matters of importance in maintaining and repairing refrigerating systems. The volume is well illustrated.

WOOLRICH, WILLIS RAYMOND AND LUIS H. BARTLETT

Handbook of refrigerating engineering. Third edition. New York D Van Nostrand Company Inc., 1948. 730 p. illus. 19 cm. $12.75. 6146

Contents Fundamental units, definitions, conversion factors, and equations. Primary refrigerants. Primary refrigerant charts and tables of thermodynamic characteristics. Nomographs for refrigerants. Reciprocating compressors. Centrifugal refrigerant compressors. Jet compressors. Condensers. Refrigerating cycles. Absorption refrigeration. Secondary refrigerants. Heat transfer. Power drives and motors. Testing the refrigerating plant. Instruments and controls. Atmospheric water cooling. Filters and water softeners. Ice and ice making. Cold storage, food preservation and fur storage. Frozen storage. Quick freezing of foods. Locker storage, commercial and farm freezers. Storage house construction. Refrigeration of meat, fish and poultry. Refrigeration in the dairy industry. Refrigeration applied to air cooling. Marine refrigeration. Lubrication. [illegible] Pumps and [illegible]. Piping and tubing details and data. Accident prevention and safety in refrigeration. Index.

Note The third edition of this handbook, the first to appear [illegible], has not only been greatly enlarged but [illegible] revised, consequent upon the tremendous strides made in the field of refrigerating engineering since the publication of the second edition in 1934. Frozen vegetables, fruits, and meats, frozen locker plants, and air conditioning are the most notable of the types in which development has been rapid and [illegible] are given in detail. The book is an up-to-date manual of data, [illegible], and tables for the engineer concerned at any point and [illegible].

WOSTREL, JOHN FRANK, AND JOHN G PRAETZ

Household electric refrigeration including gas absorption system. Second edition. New York McGraw Hill Book Company Inc., 1948. 458 p. illus. 24 cm. $6.00. 6147

Contents Simple explanation of refrigeration theory. Compression systems for household refrigeration units. Absorption systems for household refrigeration units. Control devices. Equipment for installation, service, and testing. Installation instructions for compression types of refrigeration machines. Installation instructions for absorption type. Service operations and adjustments. Service complaints—diagnosis and remedy. Motors. Food preservation. Heat transfer and insulation. Appendix. Index.

Note A practical manual for refrigeration servicemen and other persons interested in the operation, construction, adjustment, and repair of household refrigerators. The explanation of refrigeration theory given in the first chapter is intended for persons without previous technical training in the field. The remainder of the book is largely descriptive and is intended to assist its readers in understanding and repairing the refrigeration systems used in household refrigerators. The book is especially useful in relation to the repair and maintenance of such refrigerators produced in the United States of America before World War II. The changes made in preparing the second edition are not extensive, but they do include new or expanded discussions of new devices such as capillary tubes for refrigerant control. Also service instructions for Copeland, Philco, and Stewart-Warner refrigerators, which were introduced to the market after the first edition of the book was prepared, are now included.

diffusion refrigeration. Refrigerants and properties of saturated and superheated vapors. Part II, Load determination Steady-state load calculations—insulation. Transient loads. Radiation—panel cooling. Psychrometric loads—air conditioning methods. Part III, Refrigeration equipment Compression refrigerating machines. Automatic refrigerating machines—household machines. Erection, operation, testing. Cold storage. Ice manufacture—dry ice. Special applications of refrigeration engineering. Index.

Note. An engineering college textbook which is introductory in the sense that no previous education or experience in refrigeration on the part f the reader has been assumed. However it is designed to prepare students for practical work in refrigeration engineering, and the treatment is full enough for this purpose and also to make the book useful to graduate engineers. Most of the text is devoted to discussions that a practicing engineer would be concerned with in the selection or design of refrigeration equipment. In deference to the professional use of the book, the range of data presented in graphs and tables has been greatly extended in this edition. Other new matter includes a treatment of the heat pump and practical design procedure for panel cooling systems.

MAGNUS, EDWARD R , AND GRACE D MARLOTT

The refrigeration serviceman's manual. Technical adviser, Franklin P Mason, illustrated by John Bayer and John J Rhoades. Chicago Wilcox & Follett Company, 1948 688 p illus. 19 cm $5 00 6141

Contents (abridged) Section I, The refrigeration system Parts that make up the refrigerating system. Fundamental principles and theory of refrigeration How the refrigerating system works. Temperature-pressure relations in the refrigerating system. Refrigerant lines and fittings. Section II, Major service operations Refrigerants. Condensers. Receivers. Strainers and dryers. Low-pressure controls. Compressors. Section III, Minor service operations. Section IV Shop operations Shop layout and equipment. Overhauling compressors. Overhauling condensers. Servicing motors. Household cabinet refinishing and repair. Section V Sealed units Servicing the sealed unit. Absorption and adsorption refrigerating systems. Appendix. Tables. Glossary Index.

Note Most of this book is devoted to very detailed explanations of practical operations in the maintenance and servicing of refrigerators, particularly household refrigerators. The section on shop operations is especially noteworthy Both electrically driven and gas-fired types are considered. A peculiarity f the treatment is that specific makes f refrigerators are not described, nor are manufacturers' cuts used as illustrations.

MANLY, H P

Drake s refrigeration service manual an instruction and reference book covering maintenance trouble shooting and repair domestic and commercial systems Chicago Frederick J Drake & Company, 1954 349 p illus 19 cm $2 50 6142

Content Mechanical refrigeration. Compressor construction. Refrigerant control valves and evaporators. Condensers and connections. Temperature and pressure controls. Multi-temperature systems. Temperature and pressure measurements. Tubing lines for refrigerants. Removing water air and dirt. Adding and removing refrigerant. Adding and removing oil. Compressor tests and service. Valves, evaporators and condensers. Cycling control service. Trouble shooting. Absorption refrigeration. Home and farm freezers. Repair of cabinet finishes Index.

Not A vocational school text and handbook for repairmen. Practical methods for repairing electrical refrigeration, both of the household type and those found in small commercial establishments, such as soda fountains and flower shops, are covered in detail. Both the descriptive text and illustrations treat the subject in generalized way and individual makes and models of refrigerators are not dealt with in particular However typical mechanisms are dealt with specifically The chapter on trouble-shooting contains series of twenty-three tables devoted to the causes and remedies for each recognized symptom of faulty operation The preceding edition was published in 1948. The chapters on freezers and repair of cabinet finishes were added in this edition.

RABER, BENEDICT FREDERICK, AND FRA CIS W HUTCHINSON

Refrigeration and air conditioning eng neering New York John Wiley & Sons, In 1945 291 p illus 23 cm. $6.50 614

Contents Thermodynamic principles. Fundamental cycles of up refrigeration systems. Complex compression cycles for single-la system. Analysis of actual cycles. The absorption cycle. Ready sta heat transfer Periodic heat transfer Transient heat flow Psychr metric principles. Supply state of conditioned air. Psychometr processes. Process combinations. Design state and design volum Ventilation systems. Fan performance and selection. Airway desig

Note This work, intended as a text for advanced students, an as reference tool for practicing engineers, is treatment o fundamental principles rather than description of actual practice and equipment. The use of graphical methods is stressed both i the presentation of data and in the solution of refrigeration-cycl problems. There is some material on comparatively new develop ments, such as radiant heating, the heat pump, and porous-cel humidifying. Problems and brief reference lists are furnished at the end of each chapter and there is an index.

SHARPE, NORMAN

Refrigerating principles and practices. New York McGraw Hill Book Company Inc., 1949 398 p. illus. 23 cm $7 50 6144

Contents. The refrigeration load. Properties of refrigerants. Refrigeration cycles. Compressors and their lubrication. Heat-transfer equipment. The expansion alve and the accumulator Accessories. Piping for refrigerating systems. Motors and their controls. Refrigeration applications. Appendixes: Commercial storage of fruits and egetables. Internal energy of fluid. Transferred heat. Pressure and volume relation for adiabatic compression. Work required for adiabatic compression. American standard safety code for mechanical refrigeration. Index.

Note. An introductory textbook for use in undergraduate engineering courses. It is designed so as to prepare the student for practical work in refrigeration engineering Thorough explanations of theory are integrated by means of the text and problems with illustrations of practical applications. The discussions of modern refrigeration practices include such minor details as various methods of defrosting. Although much of the general material is applicable to household refrigerators, there is no specific discussion of this type of refrigerating plant, such as there is of larger plants used for cold-storage cooling and commercial ice-making.

VENEMANN, HENRY GERALD

Refrigeration theory and applications a text book on fundamental principles involved in the process of refrigeration with applications to assist the student and engineer to design maintain and operate plants. Second edition Chicago Nickerson & Collins Co., 1948 336 p illus. 23 cm. $4 00 6145

Contents The compression refrigeration system or electric refrigeration. Energy transformations Refrigerant charts and their uses. Property changes during test Calculations of results of sample test. Analysis of actual plant performance Performance of compressors Instructions for starting plants in operation. Refrigerants. Miscellaneous methods of refrigerating Air as primary refrigerant. Air and water vapor mixtures. Plant analysis via theoretical cycle. Methods of accommodating variable loads. Heat exchangers for cooling air Heat exchangers for cooling liquids. Heat exchangers—condensers. Automatic controls. Estimating plant loads. Specifications for refrigeration plant. Index.

Note A practical but relatively thorough exposition that is intended for use in college and vocational school ourses and in self instruction Improvements in the second edition include are and smaller format, revision of the first thirteen chapters incorporating much new material, the inclusion of an index, and the inclusion of paged table of contents Basic principles of mechanical refrigeration and details of refrigeration plant operation and servicing are covered. Review problems are given ith each chapter and useful data regarding the properties of refrigerants and compressor operation are tabulated throughout the volume. The pressure-enthalpy charts are now contained in a cover pocket.

WOOLRICH WILLIS RAYMOND, AND LUIS H BARTLETT

Handbook of refrigerating engineering. Third edition. New York D Van Nostrand Company Inc., 1948. 730 p. illus. 19 cm. $11.75. 6146

Contents: Fundamental units, definitions, conversion factors, and literature. Primary refrigerants. Primary refrigerant charts and tables of thermodynamic characteristics. Nomographs for refrigerants. Reciprocating compressors. Centrifugal refrigerant compressors. Jet compressors. Condensers. Refrigerating cycles. Absorption refrigeration. Secondary refrigerants. Heat transfer. Power drives and motors. Testing the refrigerating plant. Instruments and controls. Atmospheric water cooling. Filters and water softeners. Ice and ice making. Cold storage, food preservation and fur storage. Freezer storage. Quick freezing of foods. Locker storage, economics and design factors. Storage house construction. Refrigeration of meat, fish and poultry. Refrigeration in the dairy industry. Refrigeration applied to air cooling. Marine refrigeration. Lubrication. Fire. Pumps and injectors. Piping and tubing details and data. Accident prevention and safety in refrigeration. Index.

Note: The third edition of this handbook, the first to appear since post war reconstruction, has not only been greatly enlarged but entirely rewritten, consequent upon the tremendous strides made in the field of refrigerating engineering since the publication of the second edition in [illegible]. Frozen vegetables, fruits, and meats, frozen locker plants, and air conditioning are the most notable of the topics in which development has been rapid and which the new edition covers in detail. The book is an up-to-date manual of text, figures, and tables for the engineer concerned at any point with refrigeration.

WOSTREL, JOHN FRANK, AND JOHN G PRAETZ

Household electric refrigeration including gas absorption system. Second edition. New York McGraw Hill Book Company Inc., 1948. 458 p. illus. 24 cm. $6 00 6147

Contents: Simple explanation of refrigeration theory. Compression systems for household refrigeration units. Absorption systems for household refrigeration units. Control devices. Equipment for installation, service, and testing. Installation instructions for compression types of refrigeration machines. Installation instructions for absorption type. Service operations and adjustments. Service complaints—diagnosis and remedy. Motors. Food preservation. Heat transfer and insulation. Appendix. Index.

Note: A practical manual for refrigeration servicemen and other persons interested in the operation, construction, adjustment, and repair of household refrigerators. The explanation of refrigeration theory given in the first chapter is intended for persons without previous technical training in the field. The remainder of the book is largely descriptive and is intended to assist its readers in understanding and repairing the refrigeration systems used in household refrigerators. The chapters on freezers and repair of cabinet finishes were added in this edition.

RABER, BENEDICT FREDERICK, AND FRANCIS W HUTCHINSON

Refrigeration and air conditioning engineering New York John Wiley & Sons, Inc. 1945 291 p illus. 23 cm. $6 50 6143

Contents. Thermodynamic principles. Fundamental cycles of vapor refrigeration systems. Complex compression cycles for single-load system. Analysis of actual cycles. The absorption cycle. Steady state heat transfer Periodic heat transfer Transient heat flow Psychrometric principles. Supply state of conditioned air. Psychrometric processes. Process combinations. Design state and design volume. Ventilation systems. Fan performance and selection. Airway design.

Note This work, intended as a text for advanced students, and as a reference tool for practicing engineers, is treatment of fundamental principles rather than description of actual practice and equipment. The use of graphical methods is stressed both in the presentation of data and in the solution of refrigeration-cycle problems. There is some material on comparatively new developments, such as radiant heating, the heat pump, and power-cell humidifying. Problems and brief reference lists are furnished at the end of each chapter and there is an index.

SHARPE, NORMAN

Refrigerating principles and practices. New York McGraw Hill Book Company Inc., 1949 398 p illus 23 cm. $7.50 6144

Contents The refrigeration load. Properties of refrigerants. Refrigeration cycles. Compressors and their lubrication. Heat-transfer equipment. The expansion valve and the accumulator Accessories. Piping for refrigerating systems. Motors and their controls. Refrigeration applications. Appendices: Commercial storage of fruits and vegetables. Internal energy of fluid. Transferred heat. Pressure and volume relation for adiabatic compression. Work required for adiabatic compression. American standard safety code for mechanical refrigeration. Index.

Note: An introductory textbook for use in undergraduate engineering courses. It is designed so as to prepare the student for practical work in refrigeration engineering Thorough explanations of theory are integrated by means of the text and problems with illustrations of practical applications. The discussions of modern refrigeration practices include such minor details as various methods of defrosting. Although much of the general material is applicable to household refrigerators, there is no specific discussion of this type of refrigerating plant, such as there is of larger plants used for cold-storage cooling and commercial ice-making.

VENEMANN, HENRY GERALD

Refrigeration theory and applications a text book on fundamental principles involved in the process of refrigeration with applications to assist the student and engineer to design maintain and operate plants. Second edition Chicago Nickerson & Collins Co., 1948 336 p. illus. 23 cm. $4 00 6145

Contents The compression refrigeration system or electric refrigeration Energy transformations. Refrigerant charts and their uses. Property changes during test. Calculations of results of sample test. Analysis of actual plant performance Performance of compressors Instructions for starting plants in operation Refrigerant. Miscellaneous methods of refrigerating. Air as primary refrigerant. Air and water vapor mixtures. Plant analysis via theoretical cycle Methods of accommodating variable loads Heat exchangers for cooling air Heat exchangers for cooling liquids. Heat exchangers—condensers. Automatic controls. Estimating plant loads. Specifications for refrigeration plant. Index.

Note A practical but relatively thorough exposition that is intended for use in college and vocational school courses and in self instruction Improvements in the second edition include new and smaller format, revision of the first thirteen chapters incorporating much new material, the inclusion of an index, and the inclusion of paged table of contents. Basic principles of mechanical refrigeration and details of refrigeration plant operation and servicing are covered. Review problems are given with each chapter and useful data regarding the properties of refrigerants and compressor operation are tabulated throughout the volume. The pressure-enthalpy charts are now contained in cover pocket.

WOOLRICH WILLIS RAYMOND AND LUIS H. BARTLETT

Handbook of refrigerating engineering. Third edition. New York D Van Nostrand Company Inc., 1948. 730 p. illus. 19 cm. $12.75. 6146

Contents: Fundamental units, definitions, conversion factors, and abbreviations. Primary refrigerants. Primary refrigerant charts and tables of thermodynamic characteristics. Nomographs for refrigerants. Reciprocating compressors. Centrifugal refrigerant compressors. Jet compressors. Condensers. Refrigerating cycles. Absorption refrigeration. Secondary refrigerants. Heat transfer. Power drives and controls. Testing the refrigerating plant. Instruments and controls. Atmospheric water cooling. Filters and water softeners. Ice and ice making. Cold storage, food preservation and fur storage. Freezer storage. Quick freezing of foods. Locker storage, economics and design factors. Storage house construction. Refrigeration of meat, fish and poultry. Refrigeration in the dairy industry. Refrigeration applied to air cooling. Marine refrigeration. Lubrication. Fans. Pumps and injectors. Piping and tubing details and data. Accident prevention and safety in refrigeration. Index.

Note: The third edition of this handbook, the first to appear under joint authorship, has not only been greatly enlarged but totally rewritten, consequent upon the tremendous strides made in the field of refrigerating engineering since the publication of the second edition in 1938. Frozen vegetables, fruits, and meats, frozen locker plants, and air conditioning are the most notable of the topics in which development has been rapid and which the new edition covers in detail. The book is an up-to-date manual of text, figures, and tables for the engineer concerned at any point with refrigeration.

WOSTREL, JOHN FRANK AND JOHN G PRAETZ

Household electric refrigeration including gas absorption system. Second edition. New York McGraw Hill Book Company Inc. 1948. 458 p. illus. 24 cm. $6.00. 6147

Contents. Simple explanation of refrigeration theory. Compression systems for household refrigeration units. Absorption systems for household refrigeration units. Control devices. Equipment for installation, service, and testing. Installation instructions for compression types of refrigeration machines. Installation instructions for absorption type. Service operations and adjustments. Service complaints—diagnosis and remedy. Motors. Food preservation. Heat transfer and insulation. Appendix. Index.

Note: A practical manual for refrigeration servicemen and other persons interested in the operation, construction, adjustment, and repair of household refrigerators. The explanation of refrigeration theory given in the first chapter is intended for persons without previous technical training in the field. The remainder of the book is largely descriptive and is intended to assist its readers in understanding and repairing the refrigeration systems used in household refrigerators. The book is especially useful in relation to the repair and maintenance of such refrigerators produced in the United States of America before World War II. The changes made in preparing the present edition are not extensive, but they do include new or expanded discussions of new devices such as capillary tubes for refrigerant control. Also service instructions for Copeland, Philco, and Stewart-Warner refrigerators, which were introduced to the market after the first edition of the book was prepared, are now included.

AUTOMOTIVE ENGINEERING AND REPAIR

ASHBURN, ANDERSON

Automotive trouble shooting and maintenance. New York McGraw Hill Book Company, Inc., 1950 305 p illus. 24 cm $5 50 6148

Contents: General procedure. Electrical system. Fuel system. Cooling system. The engine. The power train. The chassis. List of visual aids. Index.

Note: A fairly detailed guide to "trouble shooting" of faults in automobiles intended for the instruction of students in vocational school courses. The whole range of common troubles and repairs is covered, but the book is short on information about automatic transmissions, although it does contain good discussion of overdrives. The book is a revision of *Automotive trouble shooting*, an official text of the Ordnance School of the United States Army

ATHANSON, WILLIAM T

Automobile body repair and paint guide Princeton D Van Nostrand Company Inc., 1952 95 p illus 19 cm $2.25 6149

Contents. Book I, Automobile sheet metal repair guide Glossary—terms used in automobile body and fender repair trade. Common names of automobile body panels and sections. Technique in automobile body repair Book II, Automobile paint guide. Glossary—terms used in automobile painting trade. Automobile paint guide. Helpful hints, short cuts, time saving methods. Subject index.

Note. A brief book of elementary information and practical suggestions. Terms, tools, and practical techniques are described for beginners in the trade. The author is General Manager of the Parts and Refinishing Materials Division of the Briggs Manufacturing Company

BEKKER, M G

Theory of land locomotion the mechanics of vehicle mobility Ann Arbor University of Michigan Press 1956 520 p illus. 23 cm $12 50 6150

Content Introduction. Locomotion in nature. Locomotion on wheels. Morphology of motor vehicles and environment. Some problems of soil and snow mechanics. The mechanics of wheel. Crawlers of track-laying vehicles. Skis, sleighs, and toboggans. Mechanics of motor vehicle. The trafficability of soils, performance of vehicles, and the economy of locomotion. Scale-model testing and dimensional theory References. Index.

Note A basic analytical study of the relationships between self propelled vehicles operating on land without the benefit of prepared roadbed and the soil or snow on which they move. The relationship between vehicular wheels, crawler tracks, skis and toboggans, on the one hand, and soil and snow on the other hand are analyzed; and, in most instances, mathematical equations are derived to describe them. Practical considerations, for example, the lack of uniformity in snow cover as factor in the operation of vehicles on snow are discussed also. The chapter on scale-model testing presents concisely both the cost aspect of models versus full-size prototypes for research and the mathematical theory of dimensional analysis. The bibliography gives 346 references to the analytical literature.

CROUSE, WILLIAM H.

Automotive engines, construction, operation and maintenance. New York McGraw Hill Book Company, Inc., 1955 518 p. illus. 24 cm $7 95 6151

Contents Fundamental principles. Automobile components. Engine fundamentals. Engine-performance measurements. Engine types. Engine construction and components. Pistons and valves. Automotive-engine fuels and fuel systems. Automotive-engine cooling systems. Automotive lubricants and lubricating systems. Engine-testing procedures and tools. Diagnosing engine troubles. Valve and valve-mechanism service. Connecting-rod, piston, and ring service. Crankshaft and cylinder service. Shop practice. Index.

—— Automotive fuel, lubricating and cooling systems, construction, operation, and maintenance. New York McGraw Hill Book Company, Inc., 1955 421 p. illus. 24 cm. $5 75 6152

Contents. Automotive fundamentals. Fuel-system fundamentals. Fuel-system operation. Carburetor fundamentals. Automotive carburetors. Diesel and LPG fuel systems. Automotive-engine fuels. Diagnosing fuel-system troubles. Fuel-system service. Carburetor service. Engine lubricating systems. Lubricating-system service. Engine cooling system. Cooling-system service. Appendices. Index.

—— Automotive chassis and body, construction, operation, and maintenance. New York McGraw Hill Book Company, Inc., 1955 609 p illus 24 cm $7.50 6153

Contents Fundamental principles. Automotive chassis fundamentals. Automotive springs and suspension. Shock absorbers. Steering systems. Diagnosing steering and suspension troubles. Servicing steering linkage and front and rear suspension. Front-end alignment. Manual steering-gear service. Saginaw power-steering service. Gemmer hydraguide power steering service. Linkage-type power steering service. Coaxial power-steering service. Automotive brakes. Brake service. Power brake service. Tires and tire service. Chassis lubrication. Car frame and body Air conditioning. Servicing air conditioners. Glossary Index.

—— Automotive transmissions and power trains, construction operation and maintenance. New York McGraw Hill Book Company, Inc 1955 632 p illus 24 cm. $7.50 6154

Contents Power train components. Clutches. Clutch service. Transmissions. Overdrives. Standard transmission and overdrive service. Transmissions with fluid couplings. Transmissions with torque converters. Hydra-matic type transmission service. Hydramatic transmission service. Powerglide service. Fordomatic service. Powerflite service. Drive lines. Rear axles and differentials. Appendix. Glossary Index.

—— Automotive electrical equipment construction, operation, and maintenance. Third edition. New York McGraw Hill Book Company Inc., 1955 489 p. illus. 24 cm. $6.50 6155

Contents: The language of electricity. The storage battery. Battery maintenance. Cranking-motor fundamentals. Cranking-motor trouble-shooting. Cranking-motor service. Generator fundamentals. Theory of regulator operation. Quick check of generator-regulator system. Checking and adjusting auto-lite regulators. Checking and adjusting Delco-Remy regulators. Ford regulators. Generator trouble-shooting. Generator service. Horns. The gasoline engine and fuel requirements. The ignition system. Ignition-testing instruments. Ignition service. Switches. Indicating devices. Headlights. Accessories. Periodic inspection of the electric system. Appendices. Index.

Note: The ten books listed here constitute the publisher's Automotive mechanics series, [illegible] series which is widely used in the instruction of men who are preparing for work as mechanics on automobiles. The books are used both in vocational school classes and [illegible]. They are written in [illegible] simple, straightforward style and are fully illustrated. They are organized in [illegible] designed to facilitate comprehension, with the chapters including [illegible] of review questions and tests of progress that the [illegible]. Covered are the elementary basic principles of automobile mechanisms and the full range of repair and maintenance operations on them. The illustrations include many pictures of components of automobiles of United States of America manufacture, although there is no concentration on any one manufacturer's products.

CROUSE, WILLIAM H.

Automotive mechanics. Third edition. New York. McGraw Hill Book Company Inc., 1956. 726 p. illus. 24 cm. $7.00. 6156

Contents: Shop practice. Fundamentals of the automobile. Engine operation. Engine measurements and performance. Engine types. Engine construction. The electric system. Automotive fuel systems and fuels. Automotive-engine fuels. Engine lubricating systems—[illegible] systems—[illegible]—service. Electric-system service. Fuel-system service. Lubricating-system service. Cooling-system service. Clutches. Clutch service. Transmissions. Overdrives. Standard transmission and overdrive service. Transmissions with fluid couplings. Transmissions with torque converters. Automatic transmission service. Drive lines. Rear axles and differentials. Automotive springs and suspension. Steering systems. Steering and suspension service. Automotive brakes. Brake service. Tires and tire service. Air conditioning. Index.

Note: A widely used and well-known practical text on the mechanics of present-day automobiles. Its purpose is to serve as a guide in the instruction of students in vocational schools and in vocational courses in high schools. It is useful also as a self-instruction text. Although the technical terminology of the field is freely used, the author's style is exceptionally easy to comprehend. Also, the expository text is supplemented by a very great number of diagrams and reproductions of photographs. The first edition was published in 1946 and the second edition in 1951. The length of the book has grown with each edition. In this third edition, considerable [illegible] of information has been added on automotive developments introduced on American automobiles since the second edition was published. These include new automatic transmissions, power steering, automobile air-conditioning systems, and 12-volt electrical systems.

EVEREST RALPH JAY

Motor tune-up manual. New York The Macmillan Company 1949 355 p. illus. 22 cm. $6.00 6157

Contents: The field of motor tune-up. Basic principles. Storage batteries. Battery maintenance. Ignition. Spark plugs. Fuel pumps. Carburetors. Fuels. Engine principles. Starters. Generators. Voltage regulators. Motor tune-up procedure. Glossary of trade terms. Index.

Note: A practical book on "tune-up," or the adjustment of present-day automobile engines so that they will render maximum performance. It is intended for the use of automobile mechanics and students in trade schools. The various elements of systems that affect engine operation such as the carburetor are discussed clearly from the mechanic's viewpoint with, of course, the major emphasis on the correction of troubles. The final chapter includes brief directions on the use of various instruments that have been developed to facilitate engine tune-up.

FRAZEE, IRVING AND OTHERS

Automotive brakes and power transmission systems. By Irving Frazee Walter Billiett Philip V Eshelman. Co-ordination of illustrations by Arthur E Burke. Chicago American Technical Society 1956. 266 p. illus. 22 cm. (Automotive series edited by Irving Frazee and Earl L. Bedell) $6.95 6158

Contents: Brakes, by I. Frazee and W. Billiett. Power train assembly parts, by P. Eshelman and I. Frazee. Clutches, fluid couplings and torque converters, by I. Frazee and W. Billiett. Transmissions, by P. Eshelman and W. Billiett. Auxiliary transmissions, by I. Frazee and W. Billiett. Universal joints and drive lines, by P. Eshelman and W. Billiett. Driving axles, by P. Eshelman and W. Billiett. Index.

—— Automotive electrical systems. By Irving Frazee, William Landon and Ernest Venk. Contributors Raymond Jonassen Bennie Mirkin and Edward D Spicer Co-ordination of illustrations by Arthur E. Burke. Second edition revised. Chicago American Technical Society 1956 436 p. illus. 22 cm. (Automotive series edited by Irving Frazee and Earl L. Bedell) $6.25 6159

Contents: Electricity and magnetism. Storage batteries. Generators. Generator circuits and regulators. Generating system trouble shooting. Starting systems. Lighting systems. Horns and clocks. Instruments and gauges. Index.

—— Automotive fundamentals. By Irving Frazee, Ernest Venk, George Hafferkamp, William Landon and John H. Zich. Co-ordination of illustrations by Arthur E. Burke. Chicago American Technical Society 1949 538 p. illus. 22 cm. (Automotive series edited by Irving Frazee and Earl L. Bedell) $5.25 6160

Contents: Part 1, Fundamentals of science. Part 2, Operating principles: Automotive vehicles. Engines. Fuel systems. Ignition systems. Electrical systems and instruments. Power trains. Axles. Suspension and steering. Braking control, wheel alignment, and tires. Index.

—— Automotive maintenance and trouble shooting. By Irving Frazee, William Landon and Ernest Venk. Co-ordination of illustrations by Arthur E. Burke. Second edition. Chicago American Technical Society, 1954 505 p. illus. 22 cm. (Automotive series edited by Irving Frazee and Earl L. Bedell) $5.95 6161

Contents: Maintenance, by I. Frazee and E. Spicer. Electrical systems, by I. Frazee and R. Jonassen. Gasoline engines, by I. Frazee and B. Mirkin. Gasoline fuel system, by I. Frazee and B. Mirkin. Battery ignition, by I. Frazee and B. Mirkin. Magneto ignition, by I. Frazee and E. Venk. Cooling system, by I. Frazee and B. Mirkin. Instruments, by I. Frazee and W. Landon. [illegible] and the [illegible], by I. Frazee. Brakes, by I. Frazee and B. Mirkin. Radio troubleshooting, by I. Frazee. Heaters, by I. Frazee and E. Spicer. Windshield wipers, by I. Frazee. Automatic window and seat controls, by I. Frazee. Luxury accessories, by I. Frazee. Index.

—— Automotive suspensions, steering and wheel alignment By Irving Frazee, William Landon, George Hafferkamp Co-ordination of illustrations by Arthur E Burke. Second edition, revised. Chicago American Technical Society, 1955 338 p illus. 22 cm. (Automotive series, edited by Irving Frazee and Earl L Bedell) $5 75 6162

Contents Spring. Shock absorbers. Axles. Independent front suspensions. Steering gears and linkages. The factors of wheel alignment. Effects and influences. Measurement of wheel alignment factors. Diagnosis of wheel alignment. Corrections and adjustments. Wheel alignment specifications. Index.

Note Listed above are the contents and other details of selected volumes in this publisher's *Automotive series*. All volumes in the series are specifically designed for the vocational training of automobile mechanics. They are clearly written in straightforward, factual style and are fully illustrated. The illustrations depict typical mechanisms (and repair operations on them) of passenger automobiles and trucks manufactured in the United States of America. However since the purpose is to teach automotive maintenance and repairing in general, the illustration of all repair operations on individual makes of cars is not attempted. Other volumes in the series include *Automotive collision work* second edition, 1953 335 p., $6 ■ and *Automotive fuel and ignition systems* 1953 503 p., $6 95 Still another volume is listed below under Venk, Ernest, editor

GREY, ANDREW D, editor

Automobile repair manual Philadelphia Chilton Company, Inc., 1955 904 p illus 30 cm. 6163

Contents (abridged) Alphabetical index by car make. Buick service. Cadillac service. Chevrolet service. Chrysler service. De Soto and Dodge service. Ford & Mercury 1940–48 service. Ford 1949–55 service. Henry J service. Hudson service. Kaiser Frazer service. Lincoln service. Mercury 1949–55 service. Nash and Rambler service. Oldsmobile service. Packard service. Plymouth service. Pontiac service. Studebaker service. Willys service. General service section. Miscellaneous.

Note A practical reference book of specifications and directions for repair and maintenance operations on American automobiles. For most makes of cars, models manufactured from 1940 through 1955 are covered. In the first part of the book, the arrangement is by make. Here, directions are given for all of the standard repair operations, and illustrations of various assemblies and of operations on them are shown. Specifications, that is, measurements, for such things as clearances of brake linings are given. In the second part the arrangement is by automobile part, that is brakes, carburetors, clutches, transmissions, etc. Individual makes of transmissions, such as Fordomatic and Powerflite, are covered individually and in detail. The book is concluded with a miscellaneous section of information on such matters as engine tune-up, installing of windshields and servicing of windshield wipers. A new edition covering automobiles manufactured to 1957 was published in 1957 996 p., $6 95

HEITNER, JOSEPH

Automotive mechanics principles and practice. Princeton D Van Nostrand Company, Inc. 1953 501 p illus 23 cm $6 00 6164

Contents Unit I, The motor vehicle History and operation. Unit II, The power unit Principles of engine operation. Engine parts and their functions. Multiple-cylinder engines. Engine troubles and repairs. Unit III, Bearings and lubrications. Unit IV. The fuel system Combustion and engine fuels. The carburetor Full-feed, intake, and exhaust systems. Unit The cooling system Unit VI, The electrical system Fundamentals of magnetism and electricity Battery starting, and generating systems. Ignition, lighting, and electrical instruments. Unit VII, The power train The clutch Fundamentals of gear operation. Manually operated selected transmission. The Hydramatic transmission. Torque-converter transmissions. Propeller shafts, final drafts, and differentials. Unit VIII The running system Brakes, wheels and tires. Frame suspension, and steering systems. Index.

Note A well-organized and adequately illustrated introduction to automobile mechanisms, their mechanism and repair. It is designed primarily for the instruction of vocational school students who are preparing to become automobile mechanics. It is useful also as a book of general and specific information for individual automobile owners who wish to understand their cars. It does not deal with the mechanisms of any specific make of automobile and therefore is not a substitute for the car manuals put out by manufacturers. However a few mechanisms peculiar to single manufacturers such as the Hydra-matic transmission are described and discussed. The author is a teacher in the Department of Automotive Mechanics of the High School of Science in New York City

HELDT, PETER MARTIN

The automotive chassis (without power plant), frames, springs, axles, wheels tires, drives, steering gears, brakes, universal joints, differential gears, miscellaneous parts. Third edition Philadelphia Chilton Company 1952 616 p illus 22 cm. $9 00 6165

Contents: Chassis types and layouts. Power required for propulsion and acceleration. Frames and their brackets. Front axles. Steering gears. Propeller shafts and universal joints. Differential gears. Rear axles. Spiral bevel- and hypoid-gear drives. Double-reduction and two-speed axles. Front drive, all-wheel drive and six-wheelers. Worm-gear drive. Chain drive. Brakes. Power brakes and auxiliary energy dissipators. Types of chassis springs and their characteristics. Conventional suspension systems. Independent suspensions. Rubber suspensions. Wheels and tires. Appendices. Index.

Note. The broad scope of this volume is best indicated by saying that it deals with all parts of the automobile except the engine and body It is designed for use as a text in engineering courses, and as a reference tool by automotive engineers and designers. The theory of action and constituent materials of the various parts are discussed, but emphasis is placed on the fundamentals of design. Brief historical notes trace the origin and development of each major part. The first edition was printed in 1945. The only change made in this edition is the addition of an appendix wherein are described recent developments in chassis design, particularly as regards braking equipment and rubber and air suspension systems. The second edition was published in 1948. Many revisions were made in both text and illustrations for this third edition. Among the additions is the chapter on rubber suspensions.

HELDT, P M

Torque converters or transmissions for use with combustion engines in road and rail vehicles tractors and locomotives mechanical, hydraulic electric differential, stepped and continuously variable, hand-controlled, automatic and semi-automatic. Fifth edition. Philadelphia Chilton Company, 1955 496 p. illus 22 cm $8 00 6165A

Contents. Friction clutches. Automatic and power-operated clutches. Hydraulic and electric couplings. Overrunning clutches. Some principles of toothed gearing. Sliding-gear and constant-mesh transmissions. Bearing loads in geared transmissions. Planetary transmissions. Electric drive. Hydrostatic transmissions. Some principles of hydrodynamics. Hydrodynamic torque converters. Power shift and automatic control. Continuously-variable, hydro-mechanical transmissions. Automatic and power-controlled stepped transmissions. Differential or power-shunt transmissions. Inertia type transmissions. Variable-throw transmissions. Geared transmissions for different services. Index.

Note A standard work written from the engineering viewpoint. It deals with all kinds of torque converters or transmissions currently used in conjunction with internal combustion engines in self-propelled vehicles. Hand-operated transmissions are included as well as automatic ones, with the main emphasis on the latter. Earlier editions of the book included descriptions of some automatic transmissions, such as pneumatic transmissions, no longer in use but the present edition is limited to transmissions currently in use or presenting engineering interest for some other reason. Each type of transmission is fully described as to mechanical and engineering characteristics. Engineering problems such as the design of torque converters for specific engines are fully discussed. The torque

also was published in 1951. Various changes, including deletions, revisions and additions, were made in preparing the fifth edition. One chapter was condensed, other chapters were rewritten and expanded so as to include descriptions of such developments as the newer types of automatic transmissions for passenger automobiles.

KUNS, RAY FOREST

Automatic transmissions principles and maintenance. Milwaukee The Bruce Publishing Company 1951 466 p. illus. 24 cm. $4.00 6166

Contents Automatic transmissions—hydraulic drives. Buick dynaflow automatic transmission. Chevrolet automatic transmission—powerglide torque converter. Chrysler automatic transmission—gyro-fluid drive. Ford-Mercury automatic transmission. Oldsmobile hydra-matic drive. Packard ultramatic drive—torque converter design. Studebaker automatic transmission. Index.

Note The automatic transmissions now used on a considerable number of automobiles manufactured in the United States of America, are described in this book. Operating principles are explained and the various makes of transmissions are described completely and in detail. Maintenance and repair instructions are included for most of the transmissions. The book is useful as background information for automobile mechanics. It may be used as a text to be studied for preparation for work on automatic transmissions or as a supplement to manufacturers' repair manuals. There are more than 330 illustrations, and most of these are reproductions of photographs of transmission parts or of repair operations on transmissions.

PURVIS, JUD

Auto mechanic's manual on brakes and steering including wheel alignment. Chicago The Goodheart Willcox Company Inc. 1951 175 p. illus. 22 cm. $3.50 6167

Contents Part I: Brakes and [illegible] by they brake. Brake construction. Hydraulic brakes. Brake types. Power brakes. Brake service and adjustment. Trouble shooting. Part [illegible] Steering control and wheel alignment. Front wheel geometry. Adjustment and correction. Power steering. Index.

Note A practical manual in which the fundamental principles of automobile brake and steering systems are given equal emphasis with specific instructions on adjustment and repair operations. It is supplementary and complementary to the repair manuals issued by automobile and brake manufacturers for specific models. The text is relatively simple, and there are many clear illustrations, well reproduced in large scale.

SOCIETY OF AUTOMOTIVE ENGINEERS INC.

Maintenance of automotive engine cooling systems. New York Society of Automotive Engineers, Inc., 1948 106 p. illus. 22 cm. $4.00 6168

Contents Introduction. Cooling system construction, function, and operation. Driver preventive maintenance. Mechanic preventive maintenance. Trouble shooting. Index.

Note This little manual presents in clear and concise form the basic facts regarding the construction, operation, maintenance, and repair of automobile cooling systems. The material is based on extensive tests carried out by experts in the field, and the non-technical discussion of each phase of the subject will be of practical value to automotive mechanics and the average automobile owner. Many excellent diagrams and photographs further clarify the descriptive material.

SOCIETY OF AUTOMOTIVE ENGINEERS, INC

SAE handbook. 1956 edition. New York Society of Automotive Engineers, Inc., 1956. 1 172 p. illus. 21 cm. 6169

Note An authoritative reference book published annually. It contains recommended practices and official standards of the Society of Automotive Engineers [illegible] great range of tabulated data on metal alloys and on automotive parts and general information reports, as well as lists of officers and committees of the Society. The 1957 edition was priced at $20.00 for delivery in the U. S. A., $21.00 in other countries.

TOBOLDT WILLIAM K.

Automobile body rebuilding and refinishing Scranton International Textbook Company 1950. 464 p. illus. 21 cm. $5.50 6170

Contents (abridged) Part I, The rebuilding shop and its basic operations. Planning the layout. Repairs to damaged metals. Repair methods. Welding. Part II, Rebuilding methods: Repairs to wrecked automobiles. Repairing damaged frames. Part III, Repairing individual parts: Miscellaneous repair operations. Station-wagon bodies. Part IV The paint shop. Part [illegible] Preparation for spray painting: Cleaning and paint-removal. Masking. Part VI, Spray painting: Types of finishes. Causes of spray-painting troubles. Index.

Note: All of the operations in rebuilding and refinishing of damaged automobile bodies are covered in sufficient detail for practical use in body shops. Use of modern tools, such as dinging hammers and hydraulic straightening equipment, are described. The text descriptions are supplemented by numerous photographs and line drawings. The sections on painting account for approximately four-ninths of the book's length and are outstanding for their many practical points.

TOBOLDT WILLIAM K., AND JUD PURVIS

Motor Service's new automotive encyclopedia complete course in automotive mechanics, with special emphasis on fundamental principles, trouble shooting. Published by the former publishers of *Dyke's auto encyclopedia* Chicago The Goodheart Willcox Company Inc., 1956. 815 p. illus. (part col'd) 24 cm. $7.95 6171

Contents: Automotive engines. Carburetion, fuels. Starting, lighting, ignition. Steering control, wheel alignment. Clutches, transmissions, final drives. Automobile air conditioning. Body repairing, refinishing. Shop layout, tools, equipment. British, Australian cars. Twenty-five years mechanical and tune-up specifications. Glossary of automotive terms. Index.

Note. A practical book designed for the instruction of vocational students who are preparing to work as automobile mechanics. It is used also as a self-instruction text and reference book by mechanics already at work. It explains the principles of automotive engines and their auxiliary systems in [illegible] detailed, elementary style, then describes in fully as much detail the repair and maintenance operations which present-day automobiles require. The glossary is 17 pages in length. The section "Official mechanical and tune-up specifications" provides data on wheel base, tire size, number and dimensions of cylinders, compression ratio, maximum brake horsepower, valve tappet clearances, breaker point gap, spark plug gap, degrees of camber, etc., for all passenger cars of the United States of America manufactured from 1931 through 1956. There are perhaps 3,000 illustrations, and the majority of them depict automobile mechanisms or show repair operations.

VENK, ERNEST editor

Automotive engines maintenance and repair Co-ordination of illustrations by Arthur E. Burke. Chicago American Technical Society 1951 381 p. illus. 22 cm. (Automotive series edited by Irving Frazee and Earl L. Bedell) $4.95 6172

Contents: Operating principles. Cleaning and measuring. Disassembly Cylinder heads and oil pans. Cylinder block and crankcase. Crankshafts and flywheels. Pistons and connecting rods. Valves

and valve-operating mechanisms. Engine lubrication, cooling, and mounting. Assembly. Remachining. Index.

Note. A well-organized and admirably illustrated textbook. It has been prepared with the aid of a considerable body of leaders in vocational education and the automotive service industries. It is designed principally for use in vocational school courses offered to young men who are studying to become automobile mechanics. A special advantage over older books on the same subject is the inclusion of full descriptions of present-day methods of repairing and maintaining modern high-precision engines. A second edition was published in 1957 402 p., $5 95

WOHLFEIL, THEODORE A., AND OTHERS
Automobile body reconditioning New York McGraw Hill Book Company, Inc., 1952 157 p. illus. 26 cm. $4 00 6173

Contents: Basic hand tools and their application. Welding equipment and methods of application. Basic metal-straightening techniques. Types of body-panel aligning. Use of hydraulic body jacks. Body-panel straightening. Body-panel removal and replacement. Painting equipment and techniques. Upholstery replacement. Damage estimating. Index.

Note: A well-organized and thoroughly illustrated textbook for students in vocational schools and technical courses in high schools and for apprentice mechanics in the automobile body rebuilding trade. All procedures are described in numbered steps. The book is very generously illustrated. The illustrations are reproductions of line drawings or of photographs, and they have been well chosen.

ELECTRICAL ENGINEERING

GENERAL

BULLOCK, GROVER C.

Principles of electrical engineering. Third edition. New York. McGraw Hill Book Company Inc., 1950. 605 p. illus. 23 cm $7.50. 6174

Contents: Electric currents and circuits. Fundamental units, rates, theory. The direct-current electric circuit. Magnetism and the magnetic circuit. Electromagnetic induction. Dielectric fields and capacitance. Electrostatic induction. Direct-current motors. Dynamo design and construction features. Direct-current generators. Direct-current motors. Losses, efficiencies, heating and rating. Batteries. Direct-current applications. Alternating voltages and currents. Sine wave and vector relations. The alternating-current circuit. Single-phase voltages and circuits. Polyphase voltages and circuits. The transformer. Polyphase induction motors. Single-phase motors. Alternating-current generators. The synchronous motor. Alternating-current transmission, distribution and application. Rectifiers and converters. Illumination. Electronics. Electrical measuring instruments. Installation, operation and maintenance. The testing of electrical machinery. Appendix. Index.

Note: A balanced introductory view of principles and applications is provided in this textbook. The author is Professor of Electrical Engineering at Purdue University. The mathematical level is not advanced and much of the exposition of machinery is descriptive. The first edition was published in 1931 and the second edition in 1936. The chapter on dielectric fields and circuits was added in this third edition.

COOK, ARTHUR L., AND CLIFFORD C. CARR

Elements of electrical engineering: a text book of principles and practice. Sixth edition. New York. John Wiley & Sons, Inc., 1954 682 p. illus. 23 cm. $7.00. 6175

Contents (abridged): Part I, Fundamentals of electric and magnetic circuits: Resistance, rheostats and resistors. D-C circuits. Magnetism and magnetic circuits. Capacitance. Part II, Basic relations by electrical machines. General principles of electrical machines. Losses, efficiency and ratings of dynamos. Part III, D-C machinery: Commutation and flux relations. D-C motor-starting and protective devices. Special types of D-C generators. Batteries. Part IV, A-C circuits: Sinusoidal voltages and currents. Mathematical representation of vectors. Series A-C circuits (sinusoidal relations). Polyphase circuits (sinusoidal relations). Transmission and distribution. Part V, A-C machinery: Transformers, polyphase motors, convertors equipment. Single-phase motors. A-C motor-starting protective devices. Part VI, Instruments, electronics, special applications. Electric measuring instruments. Electron tube functions in circuits. Electric control systems. Appendix—tables. Index.

Note: The work is thoroughly established as a textbook for use in short and not-too-rigorous courses such as are offered to engineering college students who are not planning to specialize in electrical engineering. It is suitable for use also as a self-instruction text. The first edition was published in 1924 and the fifth edition in 1947. In the sixth edition, the book has been extensively reorganized and rewritten without, however, changing its level or over-all scope.

COOKE, NELSON MAGOR

Mathematics for electricians and radiomen. New York McGraw Hill Book Company Inc., 1943 604 p. illus. 23 cm. $5.00. 6176

Contents: Introduction. Literal numbers. Addition and subtraction. Multiplication. Division. Equations. The slide rule—powers of ten. Units. Ohm's law—series circuits. Resistance—wire sizes. Special products and factoring. Fractions. Fractional equations. Ohm's law—parallel circuits. Simultaneous linear equations. Generator, motor and battery circuits. Exponents and radicals. Quadratic equations. Kirchhoff's laws. Logarithms. Application of logarithms to decibels and transmission lines. Angles. Trigonometric functions. Tables of functions. Solution of right triangles. Periodic functions. Elementary plane vectors. Alternating currents—fundamental ideas. Alternating currents—series circuits. Alternating currents—parallel circuits. Vector algebra.

Note: A textbook designed to furnish the electrical and radio student with a sound mathematical foundation and to show him how to apply this knowledge to the solution of practical problems most frequently encountered. The mathematical scope of the book includes elementary algebra through quadratic equations, logarithms, trigonometry, elementary plane vectors, and vector algebra as applied to alternating current circuits. The book is equally suitable for classroom and self-instruction. Answers to the problems are included.

CORCORAN, GEORGE FRANCIS

Basic electrical engineering for students of electrical engineering. New York. John Wiley & Sons, Inc., 1949 449 p. illus. 23 cm. $6.50. 6177

Contents: Classification of physical quantities. Versatility of electrical charge. Voltage, current, and power. Electrical resistance and conductivity. Joule's law—heating effects. D-c circuit analysis (linear, bilateral circuit elements). The electric field. The magnetic field. Magnetic forces. Magnetically generated voltages. Ferromagnetic circuits. Inductance. Capacitance. Boundary electromotive forces (Faraday's laws of electrolysis). Non-linear circuit elements. Appendices. Index.

Note: The fundamental concepts and some of the basic techniques of electrical engineering are explained in this introductory textbook. As indicated in the title, it is designed for students who plan to pursue the subject beyond an introductory course. The emphasis is on basic concepts and techniques, such as the vector properties of electric field intensity, and practically no space is given to descriptive material. Rationalized Mks units are used throughout. A small amount of material has been carried over from Electrical engineering fundamentals, by the author and R. R. Kurtz, New York, 1941, but this is essentially a new work, although intended for the same class of readers.

CROFT, TERRELL

American electricians' handbook, a reference book for practical electrical workers revised by Clifford C. Carr. Seventh edition. New York McGraw Hill Book Company Inc. 1953 1 773 p. illus. 19 cm. $10.00 6178

Contents (abridged): Division I, Fundamentals. Division II, Properties and splicing of conductors. Division III, Circuits and circuit calculations. Division IV, General electrical equipment and batteries. Division V, Transformers. Division VI, Electron tubes and circuits. Division VII, Generators and motors. Division VIII, Outside distribution. Division IX, Interior wiring. Division X, Electric lighting. Division XI, Wiring tables. Index.

Note: A standard handbook of fundamental and practical information pertaining to the selection, installation, and operation of electrical materials and apparatus. It is designed particularly as a practical reference book for electrical contractors and electricians. However, it contains many data that are useful also to electrical engineers. In the present seventh edition, it has the same number of pages as it had in the sixth edition. Changes are limited to the correction of errors and to revisions made necessary by the publication of the 1951 edition of the National Electrical Code. Although these revisions are important to the book's users, they do not account for a large percentage of the present text.

DAWES, CHESTER L

A course in electrical engineering Fourth edition. New York McGraw Hill Book Company, Inc., 1947–52 2 v illus 23 cm. (Electrical engineering texts, Harry E Clifford, consulting editor) $7 50 per vol. 6179

Contents. Volume I Direct currents: Resistance. Ohm's law and the electric circuit. Battery electromotive forces—Kirchhoff' laws. Primary and secondary batteries. Electrical instruments and electrical measurements. Magnetism and permanent magnets. Electromagnetism. The magnetic circuit. Self- and mutual inductance. Electrostatics—capacitance. The generator Generator characteristics. The motor Losses efficiency operation. Transmission and distribution of power Appendixes. Questions and problems. Index. Volume II, Alternating currents Alternating current and voltage. Alternating-current circuits. Complex quantities. Alternating-current instruments and measurements. Polyphase systems. The alternator Alternator regulation and operation. The transformer The induction motor. Single-phase motors. The synchronous motor The synchronous converter. Transmission of power by alternating current. Electron tubes. Rectifiers. Appendices. Questions and problems. Index.

Note. A successful introductory text, designed particularly for such persons as trade school students and electricians who do not plan to become professional electrical engineers but who need, nevertheless, a broad survey It provides fuller treatment of principles than is common in texts of this class. Basic matters, such as the properties of magnetic fields, are not omitted but are treated in simple manner Although calculus is used in some parts, most of the text can be comprehended with a knowledge of mathematics no higher than elementary algebra.

DAWES, CHESTER L

Industrial electricity Volume I Direct currents Third edition New York McGraw Hill Book Company, Inc., 1956 431 p illus. 24 cm $5 50 6180

Contents Electricity and the electric circuit. Battery electromotive force Kirchhoff's laws. Resistance. Primary and secondary batteries Primary cells. Secondary cells. Electrical instruments and electrical measurements Types of instruments. Electrical measurements. Magnetism and permanent magnets. Electromagnetism. The magnetic circuit. Electrostatics capacitance. The generator Generator characteristics. The motor Losses efficiency operation. Appendices. Questions and problems. Visual aids. Index.

Note The first edition of this elementary practical text was published in 1925 and second edition appeared in 1939 This third edition will be complete in two volumes, the present one and second one on alternating currents. The early chapters of Volume I are devoted to an exposition of the elementary basic facts about electricity These are followed by chapters on electrical devices and elements of electrical systems. Only elementary mathematics is used and, although the author has not avoided technical terms, he has taken special pains to make his descriptions clear The work is suitable for use in technical schools and also for self-instruction. In comparison to the second edition, this third edition represents a substantial revision and moderate augmentation. Numerous important changes have been made in the text and illustrations.

ERICKSON WILLIAM H., AND NELSON H. BRYANT

Electrical engineering theory and practice. New York John Wiley & Sons, Inc., 1952 523 p illus. 24 cm $6 50 6181

Contents (abridged) Resistance. Electric circuit laws and d-c circuits Magnetics and magnetic circuits. Electromagnetic induction. Inductance and capacitance. Alternating currents. Single-phase a-c circuits. Polyphase a-c circuits. Electrical instruments and measurements. The d-c machine. D-c motor control. Transformers. The three-phase induction motor Three-phase synchronous machines. Single-phase motors. Introduction to electronics Gas discharge tubes. Single-phase rectifiers Thyratrons. Power rectifiers Pliotrons. Electronics in communications. Electronic control. Appendices. Index.

Note An introductory textbook designed for students majoring in other fields of engineering than electrical A considerable range of basic machines and circuits is covered with the emphasis on basic principles. Some mathematics appears in certain parts of the exposition but, generally speaking, the treatment is essentially descriptive, or as the authors describe it "physical.

FITZGERALD, ARTHUR EUGENE

Basic electrical engineering, circuits, machines, *electronics* New York McGraw Hill Book Company Inc., 1945 443 p. illus. 23 cm 6182

Contents (abridged) Electric-circuit analysis and circuit parameters. Alternating currents and voltages. Polyphase circuits. Transients. Magnetic circuits. Transformers. Qualitative concepts of machine performance. Polyphase induction motors. Polyphase synchronous machines. *Direct-current machines. Physical* aspects of high-vacuum tubes and their associated circuits. High-vacuum tubes as circuit elements. Gas tubes and phototubes. Instrumentation. Features of electrical control. Appendix. Index.

Note. This textbook for engineering college students who are not specializing in electrical engineering is designed to give such students an understanding of fundamental electrical principles and an insight into the engineering and *scientific applications of electronics,* electrical measurements, and control. The space is about equally divided among the three main topics mentioned in the subtitle. Problems are included. The author is Professor of Electrical Engineering at Massachusetts Institute of Technology A second edition was published in 1957 540 p., $7.50.

GALBRAITH, RALPH A., AND DAVID W SPENCE

Fundamentals of electrical engineering. New York The Ronald Press Company 1955 425 p illus 23 cm $6 00 6183

Contents Introduction. The direct-current circuit. Power and energy relations. Direct-current network theory Conduction phenomena and the calculation of resistance. Circuits with non-linear elements. Steady magnetic fields. Magnetic media. Ferromagnetic materials. Magnetic circuits. Induced and motional electromotive forces self-inductance. Magnetically coupled circuits, iron losses. Electrostatics. Dielectric media. Capacitance. Problems. Index.

Note A modern, introductory textbook in which there is more than the usual emphasis on the *scientific bases of electrical* engineering. The book begins with 67-page introduction in which is presented precise and rigorous treatment of electromagnetic theory Much of the exposition in the chapters that follow is based on the assumption that the reader will have comprehended the introduction. To facilitate learning the chapters include numerous worked examples and conclude with summaries. The senior author is Dean of the College of Engineering of Syracuse University and the co-author is Assistant Professor of Electrical Engineering in the same school.

GERR, STANLEY

Japanese-English glossary of electrical and electrocommunication terms, including radio telegraphy and telephony with a section in Kana. New York Hafner Publishing Company, 1944 205 p. illus. 23 cm. $1 75 6184

Note. This Japanese-English glossary of electrical and electrocommunication terms was prepared originally for the United States Army Signal Corps. Each term is listed in three columns: the Japanese character its Japanese pronunciation, and its English equivalent. Space is provided for the owner to insert additional terms. The work is intended as supplement to ordinary Japanese-English dictionaries for the use of translators in the fields of electricity and communications.

GRAY, ALEXANDER

Principles and practice of electrical engineering Revised by G A. Wallace. Seventh edition. New York McGraw Hill Book Company Inc. 1955 598 p. illus. 23 cm $7.50. 6185

Contents (abridged) Matter and electricity Magnets and magnetism. Electromotive force. Electric circuits and resistance. Ref.

[illegible] Magnetic circuits and magnetic properties of iron. The meter-kilogram-second (mks) [illegible] Mutual inductance and self-induction. Armature [illegible] for direct-current machinery. Construction and [illegible] of direct-current machines. Theory of commutation. Characteristics of direct-current generators. Characteristics of direct-current motors. [illegible] Special direct-current machines. [illegible] Direct-current transmission and [illegible] Alternating voltages and currents. Alternating-current [illegible] Polyphase induction motors. Alternating-current [illegible] characteristics. Single-phase motors. Converting and [illegible] Electric lighting. Thermionic tubes and photo-[illegible] Laboratory experiments. Index.

Note: A long-established textbook that is designed primarily as a text for [illegible] courses offered to students who are specializing in fields of engineering other than electrical but nevertheless need some knowledge of electrical engineering. It is an elementary presentation of basic principles and facts. Principles are described [illegible] rather than mathematical terms, and typical machines are described with emphasis on their underlying principles. In comparison [illegible] the sixth edition published in 1947 [illegible] have been made in both the expository text and the [illegible] without, however, changing the scope or level of treatment. The book is 20 pages longer and most of the increased length is accounted for by [illegible] short sections on new developments and on topics not included in previous editions.

HEHLER, VICTOR PETER, AND JOHN J CAREY

Fundamentals of electrical engineering New York McGraw Hill Book Company Inc., 1948. 241 p. illus. 24 cm. (McGraw Hill electrical and electronic engineering series Frederick Emmons Terman, consulting editor) $5.50. 6186

Contents: Fundamental concepts. Unit systems. The Mks [illegible] system of units. Electric circuits. Resistance and conductance. Electrolytic conduction and batteries. Complex circuits. [illegible] Magnetic fields. Air-core magnetic circuits. [illegible] Iron-core magnetic circuits. Electric [illegible] Capacitance. Transients. Energy stored in magnetic and electric fields. Magnetostatics. Curvilinear-square flux mapping. Appendix. Index.

Note: A novel feature of considerable value in this text is the [illegible] of each fundamental quantity or relation to indicate whether it is based on experimental data or is a definition, derivation, or postulate, thus: $I = E/R$ (Exp); $P = EI$ (Def). The [illegible] long chapters on units are also helpful. The book is designed for introductory courses. It is shorter than many texts written at the same level.

KNOWLTON ARCHER EBEN editor

Standard handbook for electrical engineers, prepared by a staff of specialists. R. M. Shoop assistant editor Eighth edition. New York McGraw Hill Book Company Inc., 1949 2,311 p. illus. 23 cm. $17.00 6187

Contents: Units and conversion factors, by A. E. Knowlton and [illegible]. Electric and magnetic circuits, by H. B. Dwight and [illegible]. Measurements, by G. Thompson and others. Properties of materials, by L. F. Hickernell and others. Circuit elements, by [illegible] and others. Transformers, regulators, and reactors, by [illegible] and W. M. Dann. Alternating-current generators and motors, by [illegible] and others. Direct-current generators and motors, by C. Lynn. Rectifiers and converters, by [illegible] and C. Lynn. Prime movers, by [illegible] and others. Power economics, by [illegible]. Power system electrical equipment, by [illegible] and others. Power transmission, by [illegible] and others. Power distribution, by H. B. Gear, revised by [illegible]. Wiring design—commercial and industrial buildings, by [illegible] revised by [illegible]. Illumination, by [illegible] and others. Industrial and commercial power, by [illegible] and others. Electric heating and welding, by [illegible]. Electricity in transportation, by [illegible] and others. Electrochemistry and electrometallurgy, by [illegible]. Batteries, by [illegible]. Wire telephony and telegraphy, by W. L. Everitt, revised by [illegible]. Electronics and electron tubes, by D. G. Fink. Radio, radar and carrier communication, by D. G. Fink and others. Codes and standard practices, by W. E. Smith and others. Electrophysics, by [illegible] McEachron and others. Index.

Note: The practical value of this reference book has been maintained since its first edition in 1907 by the publication of new editions at frequent intervals. Its purpose is to bring together in readily accessible form [illegible] vast amount of technical data in the electrical engineering field, including the most frequently used fundamental theory, systems of measurements, and formulas. In addition to the changes necessitated by the development of new standards and specifications, other changes in this edition include [illegible] descriptions of new magnets and insulating materials, new sections on rotary regulators, induction heating, and radar, and a rewriting of the sections on generators, transformers, conductors, and interior wiring. The bibliographies given in each section have been brought up to date.

KRAUS, JOHN D

Electromagnetics. New York McGraw Hill Book Company Inc. 1953 604 p. illus. 23 cm. (McGraw Hill electrical and electronic engineering series Frederick Emmons Terman consulting editor) $10.00 6188

Contents: The static electric field. Part I—Part II. The steady electric current. The static magnetic field of steady electric currents—of ferromagnetic materials. Charged particles in electric and magnetic fields. Time-changing electric and magnetic fields. The relation between field and circuit theory. Maxwell's equations. Plane waves in dielectric media—conducting media. Transmission lines. Wave guides. Antennas. Boundary-value problems. Appendix. Bibliography. Index.

Note: The author of this book is Professor of Electrical Engineering at Ohio State University and the book is designed primarily for the instruction of advanced engineering students. The first seven chapters are introductory and are limited to static fields; the remaining seven are devoted to more advanced topics and will be useful to graduate engineers. A variety of reference material, ranging from [illegible] table of fundamental dimensions to [illegible] table of data on dielectric materials, is given in the appendix. The bibliography is classified by subject and consists largely of references to books.

KUEHN MARTIN H.

Mathematics for electricians. Third edition. New York McGraw Hill Book Company Inc., 1949 372 p. illus. 21 cm. $5.65 6189

Contents (abridged): Solution of simple equations. Solution of series circuits. Fractions. Radical quantities. Multiplication and division of polynomials. Factoring. Solution of quadratic equations. The slide rule. Graphs. Parallel circuits. Constants and matter problems. Solution of literal and simultaneous equations. Kirchhoff's laws. Ratio and proportion. Exponents and logarithms. Fundamental alternating-current ideas. Vectors. Complex quantities. Three-phase circuits. Appendix. Answers to problems. Index.

Note: An elementary text in applied mathematics for use either in vocational school courses or for home study purposes. Emphasis is of course on the solution of electrical problems by means of arithmetic, but explanations of basic electrical principles are also included. As in the previous editions, numerous illustrative exercises and review problems constitute an important feature of the text. The major changes in this edition include new chapters on basic arithmetic operations, logarithms, and alternating-currents, and [illegible] writing of the chapter on power.

LA PIERRE WALTER

Introduction to electrical engineering New York Harper & Brothers, 1956 339 p. illus. 24 cm. $5.25 6190

Contents: Part I, Fundamentals of electrical engineering: Electrical engineering. The resistive circuit. The inductive circuit. The capacitive circuit. Circuits with two forms of energy storage. Polyphase circuits. Principles of electrical machinery. Part II, Production and distribution of electric energy. The polyphase synchronous machine. The operation of alternating-current generators. Electric power transmission. Industrial power distribution. Production of direct current. Part III, Utilization of electric energy. Lighting. Heating. Power—the three-phase motor—the direct-current motor—the single-phase motor. Electrical instrumentation. Electrical control. Index.

Note. A modern, well-written introductory textbook. As the chapter titles indicate, it provides [illegible] broad [illegible] of the field. At the same

time the treatment of some topics, for example, the inductive circuit, is rather detailed and analytical. The author is a member of the faculty of Columbia University

NADON, JOHN M., AND BERT J GELMINE
Industrial electricity, the fundamentals of electricity, machines, electronics, illumination, and controlling equipment. Second edition New York D Van Nostrand Company, Inc., 1951 710 p illus. 24 cm. $6.50 6191

Contents Electrical algebra. Fundamentals of electricity Wiring. Magnetism. Armature winding. Generators. Motors. Controllers. Geometry and trigonometry Alternating current. A-c circuits. Transformers. Polyphase systems. Alternators. Alternating-current motors. Stator winding. Multispeed induction motors. A-c controllers. Electrical instruments. Electron tubes. Welding systems. Illumination. Electrical drawing. Index.

Note. A practical introductory text designed for use in vocational and industrial schools. It is especially suited for students who are preparing to become electricians in industrial plants. Although some space is devoted to fundamental electrical theory the main emphasis is on typical methods of application of electricity and electronics to present-day industrial machines, controls, and other electrical devices such as welders. It is simply yet clearly written. The chapters are logically developed and well illustrated with numerous original diagrams and drawings. Only simple arithmetic is used in the exposition and no previous introduction to electrical science or mathematics has been assumed. The authors were, at the time of writing, instructors in the Training Department of the Ford Motor Company where the book was developed. The first edition was published in 1939. In the present edition, the book is about 100 pages longer and contains a considerable amount of revised and newly-added material, particularly in the chapters on electron tubes, welding systems, and illumination.

PEEK, R L, JR., AND H N WAGAR
Switching relay design Princeton D Van Nostrand Company, Inc, 1955 478 p illus 24 cm $9 50 6192

Contents Introduction. Part I, Fundamentals of switching relay design: Mechanical requirements for relays. Statics of electromagnets. Dynamic performance in operation and release. Relay design. Part II, Analytical background for switching relay design Spring design. Relay vibration. The magnetic field of electromagnets. The magnetic circuit. Analysis of magnetization and pull relations. Dynamics of electromagnets. The magnet coil. Index.

Note. Written by two members of the technical staff of the Bell Telephone Laboratories, Inc., this book is based primarily on experience and research related to the use of switching relays in telephone systems. However the approach adopted for the book is a broader one, with potential applications to all other fields in which switching relays are used, including digital computers and automatic control. The treatment is primarily analytical, especially in the second part. However the mechanical requirements and practical procedures for designing springs and armatures are presented at the level of practical design in the first part. The book is directed to graduate engineers who are concerned with relay design.

PENDER HAROLD, AND OTHERS, editors
Electrical engineers' handbook Electric power Fourth edition New York John Wiley & Sons Inc, 1949 1 700 p illus 23 cm $10 00 6193

Contents (abridged) Mathematics, units, and symbols. Electric circuits and electric lines. Measurements and measuring apparatus. Batteries. Direct-current machines and rotary energy converters. Alternating-current generators and motors Transformers. Power rectifiers and inverters. Switchgear and control equipment. Power transmission and distribution. Lighting and heating. Transportation. Electrochemical and electrothermal processes. Rural electrification distribution systems. Index.

—— Electric communication and electronics. Fourth edition. New York John Wiley & Sons, Inc., 1950 1,618 p. illus. 23 cm. $10 00 6194

Contents (abridged): Mathematics, units, and symbols. Resistors, inductors, and capacitors. Electron tubes. Electric circuits, lines, and fields. Passive circuit elements. Vacuum-tube circuit elements. Frequency modulation. Pulse techniques. Transmission circuits. Electrical measurements. Acoustics. Electromechanical-acoustic devices. Electro-optical devices. Sound-reproduction systems. Telephony Telegraphy Facsimile transmission and reception. Television. Electronic control equipment. Medical applications of electricity Index.

Note A standard American handbook of electrical engineering. Together, the two volumes cover all aspects of the field, providing both basic knowledge and engineering data. The titles given in the above tables of contents are section titles. Each of the sections contains several chapters in which fundamentals and current practice pertaining to a specific topic, such as X-ray tubes, are concisely presented. In comparison to the third edition published in 1936, the fourth edition is the result of an extensive revision. Numerous topics, such as electrolytic polishing of metals, permanent magnet materials, the heat pump, frequency modulation, pulse technique, and electro-optical devices, were either added or rewritten. The volumes have separate indexes and may be used independently

RASCH, WILLIAM EDWARD
Practical electrical mathematics. Boston D C. Heath and Company, 1946 357 p. illus. 19 cm. $3.20 6195

Note. Each of the 42 "assignments" in this practical textbook consists of a short discussion of some particular aspect of electrical theory or practice, a series of completely worked illustrative examples with explanations in words completely describing each of the mathematical steps involved, and a series of problems for the student to solve. Among the topics discussed are computing electric light and power bills, line drop and line loss, three-wire circuits, inductance, power factor direct-current generators and motors. The book is intended for use in trade school courses.

REED, MYRIL BAIRD, AND GEORGIA B REED
Mathematical methods in electrical engineering. New York Harper & Brothers, 1951 338 p 24 cm. $5 00 6196

Contents Imaginary numbers and hyperbolic functions. Linear algebraic equations—determinants. Matrix algebra. Zeros of polynomials—Graeffe method. Partial and continued fractions. Vector analysis. The Fourier series. Linear differential equations with constant coefficients. Transients in one-mesh electrical networks. Transients in multimesh networks. Bessel functions. Partial differential equations. Analytic functions of a complex variable. Index.

Note: A textbook in which the authors have made a special effort to present in compact form the mathematical knowledge essential to professional work in present-day electrical engineering. Mathematical concepts and techniques no longer in much use have been eliminated. On the other hand, such methods as matrix algebra are discussed at some length. The exposition includes numerous worked examples.

SCHILLING, EUGENE WASHBURN
Theory and application of electrical engineering Scranton International Textbook Company, 1951 402 p illus 23 cm. $7.50. 6197

Contents Abbreviations. Electricity Resistance. Electric circuits Energy and power. Magnetism and magnetic circuits. Induced electromotive force. Direct-current instruments and meters. Capacitance. The direct-current motor. Alternating currents. Alternating-current instruments and meters. Polyphase alternating currents. Transformers. Polyphase induction motors. Single-phase motors. Motor applications. Alternating-current generators. Synchronous motors and parallel operation of alternators. Electronics and electronic equipment. Electric rates. The d-c generator. Storage batteries. Illumination. Transmission and distribution. Appendix. Index.

Note. An introduction to the fundamentals of electrical engineering for use in all types of college engineering courses. The coverage is more inclusive and less detailed than is typical of books that were written specifically for electrical engineering students. Although the basic theories of electricity are outlined, a background knowledge of this subject is assumed together with a grounding in advanced algebra. Review problems conclude each chapter The author is Dean of Engineering in Montana State College.

Croft, Coates Walton

Croft's lessons in practical electricity. Eighteenth edition, revised and enlarged by Erich Hausmann. New York: D. Van Nostrand Company, Inc., 1948. 769 p. illus. 24 cm. $4.50. 6198

Contents (abridged): Electricity and matter. Magnets and magnetic fields. Primary cells. Storage batteries. Resistance. Series and parallel circuits. Electrical instruments. Electrical measurements. [illegible] Alternating currents. Networks and polyphase circuits. Direct-current generators. Direct-current motors. Synchronous machinery. Induction motors. Transformers and rectifiers. Lamps. Radio transmission. Radio reception. Television and associated aids. Appendix. [illegible] Index.

Note: This standard text affords a clear explanation of electrical principles, [illegible] problems, and descriptions of electric machines and apparatus. There are questions at the end of each chapter, and a selection of problems with answers. An excellent text for the beginner, and particularly for the student working by himself.

Lowe, William Henry

Basic electricity for communications: a textbook for workers in communications and industrial electronics. New York: John Wiley & Sons, Inc., 1943. 603 p. illus. 22 cm. $5.96. 6199

Contents: Some fundamentals. Ohm's law. Electrical power and energy. Electrical conductors. Measurement of resistance. Ohm's law extended. Kirchhoff's law. Batteries. Magnets and magnetic circuits. Generators and motors. Inductance. Capacitance. Alternating currents. Simplification of circuits by Thevenin's theorem. Vacuum tubes and gaseous conduction. Electrical communication systems. Appendix. Index.

Note: An elementary textbook intended for the worker in communications and industrial electronics who does not intend to undertake the formal study of engineering but who must be familiar with basic electrical principles. Application to practical problems and modern equipment is emphasized rather than formal theory and mathematical formulas. A survey is given of the broader principles as well as wire and radio transmission of telegraph signals and speech, and the application of Ohm's law to communications circuits is thoroughly explained.

Timbie, William Henry

Elements of electricity. Fourth edition. By William H. Timbie, assisted by Alexander Kusko. New York: John Wiley & Sons, Inc., 1953. 631 p. illus. 22 cm. $6.50. 6200

Contents: Ohm's law. Electrical power and energy. Conducting wire. Measurement of resistance. Magnetic and magnetism. The magnetic circuit. The generator. The operation of direct-current generators. Electric motors. Electrical and electrochemical action. Simplification of circuits. Inductance. Capacitance. Alternating currents. Electronics and vacuum tubes. Electrostatic behavior. Appendices. Index.

Note: A clearly written introductory text for first-year engineering college students. The discussion is limited to the basic principles of direct- and alternating-current generation, distribution, and utilization in lighting, power and communications. The treatment is [illegible] in this revision, the purpose and arrangement do not differ from the third edition (1937), but certain chapters have been rewritten and revised to reflect developments in the electrical and electronic fields. New material has been added on such devices as [illegible], transistors, [illegible] and gas rectifiers.

Timbie, William Henry, and others

Principles of electrical engineering. By William H. Timbie, Vannevar Bush, assisted by George B. Hoadley. Fourth edition. New York: John Wiley & Sons, Inc., 1951. 626 p. illus. 23 cm. $7.00. 6201

Contents: Some fundamental considerations. Kirchhoff's laws. Electric power and energy. Simplification of resistor networks. Conduction and resistors. Conduction in solids and liquids. Transients in electric circuits. Alternating-current circuits. The magnetic circuit. Interconnection between electric circuits and magnetic fields. The magnetic properties of iron and steel. Steady magnetic fields. Steady electric fields. Electronics. Electromagnetic waves. Appendix. Index.

Note: An introductory text, widely used in first-year college engineering courses. The treatment stresses basic principles and requires a background knowledge of calculus and physics. Although retaining the general scope and arrangement of the previous edition, this revision has been extensively rewritten to relate the fundamental theories to recent practical developments in the field. The chapters on conductors and conduction and transients, in particular, have been expanded, and a chapter on a-c circuits has been added. These changes and the inclusion of new material on [illegible], dry-rectifiers, [illegible] of electrons, electron guns, etc., account for almost 150 additional pages.

United States. National Bureau of Standards

Code for protection against lightning. Sponsors: American Institute of Electrical Engineers, National Fire Protection Association, National Bureau of Standards. Approved by the American Standards Association 1952 (ASA C5). Issued December 10, 1952. Washington, D. C.: Government Printing Office, 1952. 88 p. illus. 19 cm. (United States. National Bureau of Standards. Handbook 46) $0.40. 6202

Contents: Part I, Protection of persons: Introduction. Purpose. Personal conduct. Part II, Protection of buildings and miscellaneous property: Introduction. Scope, definitions, etc. Lightning protection for ordinary buildings. Miscellaneous structures. Buildings containing [illegible] materials. Smokestacks and chimneys. Hangars, balloons, and airships. Ships. Trees. Livestock in fields. Part III, Protection of structures containing flammable liquids and gases. Introduction. Scope, exceptions, etc. Protective measures. Protection of specific classes of structures. Appendices: Lightning, its origin, characteristics, and effects. Bibliography.

Note: Accepted specifications for the protection of structures and farm livestock against lightning are published in this code. Also included are discussions of safe conduct on the part of persons during thunderstorms, of the characteristics of lightning, and of the nature of damage done by it. The bibliography is 15 pages long.

Van Valkenburgh, Nooger & Neville, Inc.

Basic electricity. New York: John F. Rider Inc., 1954. 5 v. in 1. illus. 23 cm. $11.50. 6203

—— Basic electronics. New York: John F. Rider Inc., 1955. 5 v. in 1. illus. 23 cm. $11.50. 6204

Note: These sets are complementary introductory courses in elementary electricity and electronics which were originally developed for use at specialty schools of the United States Navy by a firm that specializes in the production of package training programs. Ideas are presented one at a time in logical sequence and practically everyone is presented both in words and pictures. Many of the pictures are cartoon-type drawings. The sets are well suited to the needs of young men who must study electricity and electronics in vocational schools or teach themselves. There is less matter in the sets than the five-volumes-in-one format might be taken to indicate.

Vinal, George Wood

Primary batteries. New York: John Wiley & Sons, Inc., 1950. 336 p. illus. 21 cm. $6.50. 6205

Contents: Historical introduction. Elementary theory of voltaic cells. Dry cells—materials and production. Operating characteristics of dry cells. Effect of low temperatures on dry cells, and low-temperature types. Standard cells, standards of electromotive force. Air-

time the treatment of some topics, for example, the inductive circuit, is rather detailed and analytical. The author is a member of the faculty of Columbia University

NADON, JOHN M., AND BERT J GELMINE
Industrial electricity, the fundamentals of electricity, machines, electronics, illumination, and controlling equipment. Second edition. New York D Van Nostrand Company, Inc., 1951 710 p illus. 24 cm. $6 50 6191

Contents: Electrical algebra. Fundamentals of electricity Wiring. Magnetism. Armature winding. Generators. Motors. Controllers. Geometry and trigonometry Alternating current. A-c circuits. Transformers. Polyphase systems. Alternators. Alternating-current motors. Stator winding. Multispeed induction motors. A-c controllers. Electrical instruments. Electron tubes. Welding systems. Illumination. Electrical drawing. Index.

Note: A practical introductory text designed for use in vocational and industrial schools. It is especially suited for students who are preparing to become electricians in industrial plants. Although some space is devoted to fundamental electrical theory the main emphasis is on typical methods of application of electricity and electronics to present-day industrial machines, controls, and other electrical devices such as welders. It is simply yet clearly written. The chapters are logically developed and well illustrated with numerous original diagrams and drawings. Only simple arithmetic is used in the exposition, and no previous introduction to electrical science or mathematics has been assumed. The authors were, at the time of writing, instructors in the Training Department of the Ford Motor Company where the book was developed. The first edition was published in 1949 In the present edition, the book is about 100 pages longer and contains a considerable amount of revised and newly-added material, particularly in the chapters on electron tubes, welding systems, and illumination.

PEEK, R. L, JR, AND H. N WAGAR
Switching relay design. Princeton D Van Nostrand Company, Inc., 1955 478 p illus. 24 cm. $9 50 6192

Contents. Introduction. Part I, Fundamentals of switching relay design: Mechanical requirements for relays. Statics of electromagnets. Dynamic performance in operation and release. Relay design. Part II, Analytical background for switching relay design Spring design. Relay vibration. The magnetic field of electromagnets. The magnetic circuit. Analysis of magnetization and pull relations. Dynamics of electromagnets. The magnet coil. Index.

Note: Written by two members of the technical staff of the Bell Telephone Laboratories, Inc., this book is based primarily on experience and research related to the use of switching relays in telephone systems. However the approach adopted for the book is a broader one, with potential applications to all other fields in which switching relays are used, including digital computers and automatic control. The treatment is primarily analytical, especially in the second part. However the mechanical requirements and practical procedures for designing springs and armatures are presented at the level of practical design in the first part. The book is directed to graduate engineers who are concerned with relay design.

PENDER, HAROLD, AND OTHERS, editors
Electrical engineers' handbook Electric power Fourth edition. New York John Wiley & Sons Inc 1949 1,700 p illus. 23 cm $10 00 6193

Content (abridged) Mathematics, units, and symbols. Electric circuits and electric lines. Measurements and measuring apparatus. Batteries. Direct-current machines and rotary energy converters. Alternating-current generators and motors. Transformers. Power rectifiers and inverters. Switchgear and control equipment. Power transmission and distribution. Lighting and heating. Transportation. Electrochemical and electrothermal processes. Rural electrification distribution systems. Index.

—— Electric communication and electronics. Fourth edition. New York John Wiley & Sons, Inc., 1950 1 618 p illus. 23 cm. $10 00 6194

Contents (abridged) Mathematics, units, and symbols. Resistors, inductors, and capacitors. Electron tubes. Electric circuits, lines, and fields. Passive circuit elements. Vacuum-tube circuit elements. Frequency modulation. Pulse techniques. Transmission circuits. Electrical measurements. Acoustics. Electromechanical-acoustic devices. Electro-optical devices. Sound-reproduction systems. Telephony Telegraphy Facsimile transmission and reception. Television. Electronic control equipment. Medical applications of electricity Index.

Note: A standard American handbook of electrical engineering. Together, the two volumes cover all aspects of the field, providing both basic knowledge and engineering data. The titles given in the above tables of contents are "section" titles. Each of the sections contains several chapters in which fundamentals and current practice pertaining to a specific topic, such as X-ray tubes, are concisely presented. In comparison to the third edition published in 1936, the fourth edition is the result of an extensive revision. Numerous topics, such as electrolytic polishing of metals, permanent magnet materials, the heat pump, frequency modulation, pulse techniques, and electro-optical devices, were either added or rewritten. The volumes have separate indexes and may be used independently

RASCH, WILLIAM EDWARD
Practical electrical mathematics. Boston D C. Heath and Company, 1946 357 p. illus. 19 cm. $3 20 6195

Note Each of the 42 "assignments" in this practical textbook consists of a short discussion of some particular aspect of electrical theory or practice, a series of completely worked illustrative examples with explanations in words completely describing each of the mathematical steps involved, and a series of problems for the student to solve. Among the topics discussed are computing electric light and power bills, line drop and line loss, three-wire circuits, inductance, power factor direct-current generators and motors. The book is intended for use in trade school courses.

REED, MYRIL BAIRD, AND GEORGIA B REED
Mathematical methods in electrical engineering New York Harper & Brothers, 1951 338 p 24 cm $5 00 6196

Contents: Imaginary numbers and hyperbolic functions. Linear algebraic equations—determinants. Matrix algebra. Zeros of polynomials—Graeffe method. Partial and continued fractions. Vector analysis. The Fourier series. Linear differential equations with constant coefficients. Transients in one-mesh electrical networks. Transients in multimesh networks. Bessel functions. Partial differential equations. Analytic functions of a complex variable. Index.

Note: A textbook in which the authors have made a special effort to present in compact form the mathematical knowledge essential to professional work in present-day electrical engineering. Mathematical concepts and techniques no longer in much use have been eliminated. On the other hand, such methods as matrix algebra are discussed at some length. The exposition includes numerous worked examples.

SCHILLING, EUGENE WASHBURN
Theory and application of electrical engineering Scranton International Textbook Company 1951 402 p. illus. 23 cm. $7.50 6197

Contents. Abbreviations. Electricity Resistance. Electric circuits. Energy and power Magnetism and magnetic circuits. Induced electromotive force. Direct-current instruments and meters. Capacitance. The direct-current motor Alternating currents. Alternating-current instruments and meters. Polyphase alternating currents. Transformers. Polyphase induction motors. Single-phase motors. Motor applications. Alternating-current generators. Synchronous motors and parallel operation of alternators. Electronics and electronic equipment. Electric rates. The d-c generator Storage batteries. Illumination. Transmission and distribution. Appendix. Index.

Note: An introduction to the fundamentals of electrical engineering for use in all types of college engineering courses. The coverage is more inclusive and less detailed than is typical of books that were written specifically for electrical engineering students. Although the basic theories of electricity are outlined, background knowledge of this subject is assumed together with a grounding in advanced algebra. Review problems conclude each chapter. The author is Dean of Engineering in Montana State College.

FICH SYLVAN

Transient analysis in electrical engineering. New York Prentice-Hall, Inc., 1951 306 p.

depolarized and other batteries. Copper and copper oxide cells. Silver oxide and chloride batteries. Lead cells having soluble reaction products. Mercuric oxide and vanadium dry cells. Fused-electrolyte cells. Index.

Note. A thorough treatise on a topic which is almost devoid of book literature. Most of the discussion has to do with the chemical and electrical principles and the operating characteristics of primary batteries. Although descriptions and diagrams of commercial cells are included, the book is less suitable for the occasional user of dry batteries than it is for engineers who need to understand primary batteries in connection with the design or specification of electrical apparatus. The literature of the subject is cited in footnotes.

VINAL, GEORGE WOOD

Storage batteries, a general treatise on the physics and chemistry of secondary batteries and their engineering applications Fourth edition. New York John Wiley & Sons, Inc., 1955 446 p illus 24 cm. $10 00 6206

Contents Introduction. Materials and methods of manufacture. The electrolyte. Theory of reactions, energy transformation, and voltage. Capacity Operation. Resistance. Efficiency Testing storage batteries. Present-day uses for storage batteries. Index.

Note. The first edition of this work was published in 1924, and it still holds its place as the most generally satisfactory treatment of the subject. This fourth edition, although shorter by about 20 pages than the third edition, contains much new material, both textual and illustrative. New information and data have been added on a wide range of subtopics, including battery additives, silver oxide batteries, fast charges, new types of separators, and 12-volt automobile batteries. The number of literature references has been increased.

MEASUREMENTS

AMERICAN STANDARDS ASSOCIATION

American standard code for electricity meters. Prepared by a sectional committee of the American Standards Association under the joint sponsorship of the National Bureau of Standards Association of Edison Illuminating Companies Edison Electric Institute. Fourth edition 1941 Approved, American Standards Association, May 5, 1941 New York Edison Electric Institute, 1941 128 p 22 cm $2 00 6207

Contents General definitions. Measurement of power and energy Specifications for acceptance of types of electricity meters. Specifications for acceptance of types of auxiliary apparatus for use with meters. Installation methods. Watthour meter test methods. Laboratory and service tests. Demand meters and devices. Index.

Note A reference manual covering the many phases of electric meter practice as encountered by all electric companies, both large and small, and intended for use of those responsible for and interested in the purchase, installation, and operation of electric meters While the code is based upon scientific and technical principles, the commercial side of metering has been emphasized. Definitions of terms, types of watthour meters, manufacturers' information, specifications of design and construction tests, adjustments, accuracy and related topics are summarized in concise form.

GHIRARDI, ALFRED A., AND ROBERT G MIDDLETON

How to use test probes New York John F Rider Publisher Inc. 1954 176 p illus. 22 cm. $2 90 6208

Contents. Resistive high-voltage of d-c probes. Capacitance-divider high-voltage a-c probes. Test-cable shielding and test-circuit loading fundamentals. Resistive circuit-isolation probe (the "d-c probe"). Compensated r-c ("Low-capacitance") and cathode-follower circuit-isolation probes. Rectifying probes for the VTVM. Demodulator probes. Index.

Note The phrase "test probes" designates a class of accessories used with electrical and electronic measuring and testing instruments such as the voltmeter and cathode ray oscilloscope. The probe usually has a shape resembling a thick pencil and is equipped with a metal tip which is used for making temporary contact with various points in the circuitry of the apparatus under test. By building resistors, capacitors, rectifiers, etc., into the probe, the range and utility of the mother instrument can be considerably extended. In this book, the principles of test probes and their uses are explained technically though nonmathematically for such readers as technicians who repair and adjust television receivers and other electronic equipment.

HARRIS, FOREST KLAIRE

Electrical measurements. New York John Wiley & Sons, Inc., 1952 784 p. illus. 24 cm. $10 50 6209

Contents The art of measurement. Electrical units. Direct-current galvanometers. Indicating instruments. Direct-current ammeters and voltmeters. Potentiometers. Resistors and resistance measurements. Ballistic galvanometers. Magnets and magnetic testing. Alternating-current ammeters and voltmeters. The measurement of power Energy measurements. Instrument transformers. Wave-form and frequency measurements. Alternating-current bridges. Index.

Note. This book is limited to direct-current and low-frequency measurements, but within this area it provides a very substantial treatment for laboratory workers and advanced students of physics. The operating principles and circuits of the chief instruments are described, and the limitations of each instrument are covered specifically The main emphasis is on the use of available instruments so as to obtain results of the accuracy desired for the measurement in hand. The author is a physicist on the staff of the National Bureau of Standards and a faculty member of George Washington University

KINNARD, ISAAC F

Applied electrical measurements. Contributors F E Arnold, A. J Corson, H. C. Dickinson, A. Hansen, Jr, R. G Jewell, E E Lynch, J R. Macintyre, N P Millar, M. A Princi C. F Savage, A. G Stimson, H. E Trekell Arnold White, J H. Wright. New York John Wiley & Sons, Inc., 1956. 600 p. illus. 24 cm. $15 00 6210

Contents Part I, Measurements of electrical quantities: Milestones in the progress of electrical measurement. Theory of measurements. Functional analysis of measurements. Current and potential difference. Resistance, inductance, capacitance, and storage factor Q Power and energy Phase angle, power factor synchronism, and frequency Waveform. Magnetism. Transformers for measurement. Telemetering. Part II, Measurements of nonelectrical quantities Light. Heat. Sound. Statics and kinetics. Liquids and gases. Time. Applications. Index.

Note. Graduate scientists and engineers in industry are the intended audience for this book hence, an acquaintance with basic electrical and physical principles and concepts is assumed. Nevertheless basic principles such as Ohm's law are concisely reviewed in appropriate chapters. Definitions are stated with care. Measuring instruments and systems are described as to principles, uses and operating characteristics, but commercially available instruments are not specifically identified. Good bibliographies are included in the chapters. The book is primarily suited to use as a reference book by engineers and scientists who are not specialists in instruments but who need, on occasion, basic information on the measurements of electrical quantities or electrical techniques of measuring nonelectrical quantities.

SPENCER, JAMES

Maintenance and servicing of electrical instruments. Third edition. Pittsburgh The Instruments Publishing Company, Inc. 1951 256 p illus 21 cm $2 00 6211

Contents. Tools and equipment. Direct-current instruments. A-C ammeters and voltmeters. A-C wattmeters. Brief summary of A-C types. Instrument transformers. Frequency meters. Synchroscopes. Power factor meters and RVA meters. Dial marking. Pivots and jewels. Springs, detachable instruments. Damping means. Pivots and bearings, by M. F Behar and F E. Williamson. Index.

Networks

Note: A basic collection of mathematical notions and techniques which are useful to engineers in the analysis and study of electrical networks and fields. It ... organized for the instruction of engineering ... students and has the usual problems for students to solve. ... It ... useful also for orientation and reference by graduate ... Lecture proofs are not included in view of the book's general nature.

JOHNSON WALTER C.

Transmission lines and networks. New York. McGraw Hill Book Company Inc., 1950. 361 p. illus. 23 cm. (McGraw Hill electrical and electronic engineering series Frederick E. Terman, consulting editor) $7.00. 6223

Contents: Part 1, Transmission lines: Distributed constants and traveling waves. The ... steady state—lines with no reflections. The ... Transmission ... of two-conductor lines. Lines with reflections. Transmission line charts. Special considerations for radio-frequency lines. Radio-frequency line-measurements and impedance matching. Special considerations for telephone and telegraph lines. Special considerations for power lines. Part 2, Four-terminal networks A review of ... network analysis. The characteristics of passive four-terminal networks. The image and iterative operation of four-terminal networks. Insertion loss and reflection factors. Filters. The ... of ... Index.

Note: An engineering textbook which has been developed from ... used by the author in courses given to advanced electrical engineering students at Princeton University. It is designed to ... graduate students who are majoring in either power or communications engineering with the basic principles of transmission lines and elementary methods of analyzing four-terminal networks. Most of the ... goes over to mathematical analysis of specific phenomena ... material is ... characteristics, but some qualitative ... descriptive ... is ... included into the discussion of such phenomena as the skin effect and such special engineering problems as those presented by telephone lines.

JORDAN EDWARD CONRAD

Electromagnetic waves and radiating systems. New York Prentice-Hall, Inc. 1950 710 p. illus. 22 cm. (Prentice-Hall electrical engineering series W L. Everitt, editor) $9.00. 6224

Contents: Fundamentals of electromagnetic engineering. Electrostatics. The steady magnetic field. Maxwell's equations. Electromagnetic waves. Poynting vector and the flow of power. Guided waves. Transmission lines. Wave guides. Radiation. Impedances. Directional characteristics of antennas. Impedance characteristics of antennas. Antenna practice and design. Secondary sources and aperture antennas. Ground wave propagation. Sky wave propagation. Appendices. List of symbols. Index.

Note: An introductory but substantial treatment of field theory for upperclass and graduate students majoring in physics or electrical engineering, especially those who are preparing for research or design in communications. The field vectors E and H are introduced on the first page of ... and are used throughout the remainder of the book. The material on antennas is comprehensive enough to make it of interest to practicing communications engineers. Throughout the book, there are footnote references and chapter bibliographies.

KEISTER, WILLIAM AND OTHERS

The design of switching circuits. By William Keister Alistair E. Ritchie and Seth H. Washburn. New York D Van Nostrand Company Inc., 1951 556 p. 24 cm. (Bell Telephone Laboratories series) $8.75 6225

Contents: Fundamental control concepts. Switching apparatus. Basic relay control paths. Relay contact network configurations. Switching algebra, and manipulation of relay contact networks. Design of combinational relay circuits. Time charts, sequence charts, simplified schematics, and graphic descriptions of relay circuits. Design of sequential relay circuits. Elementary switch control circuits. Elementary electronic switching circuits. Circuits for counting. Codes and translating circuits. Circuits for selecting. Circuits for connecting. Circuits for lockout. Circuits for finding and hunting. Circuits for timing. Circuits for pulse generation. Circuits for checking. Circuits for registration. Circuits for calculating. General principles of multifunctional circuit design. Planning ... multifunctional circuit. Detailed design of ... multifunctional circuit. Index.

Note: Switching circuits constitute ... highly developed area in telephone engineering, and the subject is becoming important in such other fields as the design of electronic computers. This book, written by members of the staff of the Bell Telephone Laboratories, Inc., is based upon telephone experience, but is ... general and ... but theoretical treatment slanted for use outside the telephone field. Though organized as ... textbook and designed for upperclass engineering students as well as for practicing engineers, not much mathematics is employed. The greater part of the text can be understood by anyone with ... moderate knowledge of electrical circuits and terminology.

KERCHNER, RUSSELL M AND GEORGE F CORCORAN

Alternating-current circuits. Third edition. New York John Wiley & Sons, Inc., 1951 598 p. illus. 23 cm. $6.50. 6226

Contents: General concepts and definitions. Instantaneous current and power (sinusoidal voltage applied). Effective current and voltage —average power. Vector algebra (as applied to A-C circuit analysis). Sinusoidal single-phase circuit analysis. Non-sinusoidal waves. Coupled circuits. Balanced polyphase circuits. Unbalanced polyphase circuits. Alternating-current measurements. Determination of circuit parameters. Transmission line calculations. Electric wave filters. Symmetrical components. Power system short-circuit calculations. Transient conditions. Index.

Note: This book is used as textbook in first courses in alternating current circuits offered to undergraduate engineering students who have completed courses in differential and integral calculus. In addition to ... study of the fundamentals of alternating-current circuits, it discusses such specialized topics as energy measurements in polyphase circuits, electric filter theory, symmetrical components. A variety of minor revisions and additions including the nodal method of circuit analysis, and the three-... vector diagram of polyphase circuits, were made in the third edition.

KIMBARK EDWARD WILSON

Electrical transmission of power and signals. New York John Wiley & Sons Inc., 1949 461 p. illus. 24 cm. $7.00. 6227

Contents: Introduction. Parameters of simple two-conductor lines. Parameters of multiconductor lines. Parameters of ground-return lines. Steady-state performance of ... Parameters of ... lines. Lossy lines. Transient phenomena on transmission lines. Transmission-line charts. Electric networks on transmission lines. Transmission lines. Telephone and telegraph power transmission. Impedance matching. Telephone and telegraph transmission. Radio-frequency transmission lines. Filters. Skin effect. Wave guides. Appendices: Characteristics of conductors for open-wire power transmission lines. Characteristics of transmission lines for power and signals. Index.

Note: An engineering college textbook designed for courses offered to students who have had an introduction to circuits with lumped parameters. It ... an introduction to circuits with distributed parameters. The theory of this type of circuit has application in both power transmission and communication engineering. The chapters are supplemented by fairly long lists of references. The author is Dean of the School of Engineering at Seattle University.

KRAEHENBUEHL, JOHN OTTO AND MAX A. FAUCETT

Circuits and machines in electrical engineering. Second edition. New York John Wiley & Sons, Inc., 1947 2 v illus. 24 cm. $6.00 each. 6228

Contents: Volume 1, Circuits: Fundamental considerations in the field of electrical engineering. Electromotive force—current. Resistance —energy-consuming counteraction. Inductance—reversible counteraction. Capacitance—reversible counteraction. The general circuit. Symbolic treatment of vectors—complex quantities. Circuit parameters in series. Circuit parameters in parallel. Solution of networks. Power and energy—single-phase alternating- and direct-current power. Polyphase circuits. Power in polyphase circuits. Power distribution. Electronics. Appendix. Index. Volume II, Machines: Machine construction and windings. The magnetic circuit. Magnetomotive force,

illus 22 cm. (Prentice-Hall electrical engi neering series, W L Everitt, editor) $6.50 6217

Contents General theory Classical solution of linear differential equations. Classical solution of single-energy transients. Classical analysis of double-energy transients. Systems defined by second-order equations. The Laplace transformation. Applications of the Laplace transformation. Solution of higher-degree algebraic equations. Cir cuits involving higher-order equations. Representation and trans formation of periodic and nonperiodic functions. Elements of com plex variable theory Applications of contour integration. Systems having distributed parameters. Electrical analogues f engineering systems. Appendix. Table f Laplace transforms. Specific functions. Index.

Note. This textbook for electrical engineering students extends transient analysis to include modern operational methods and at the same time presents classical theory N previous knowledge of dif ferential equations is needed. The chapters include summaries, illus trati examples with complete solutions, and over 200 problems, many of them with answers.

GARDNER, MURRAY FRANK, AND JOHN L BARNES

Transients in linear systems studied by the Laplace transformation Volume I. New York John Wiley & Sons, Inc., 1942 389 p illus 23 cm. $8 00 6218

Contents Introduction. The mathematical expression of one-dimensional problems concerning electrical and mechanical sys tems. An introduction to the Laplace transformation and its inverse. The Laplace transformation and its application to simple functions. The Laplace transformation of integro-differ ential equations in one independent variable. The Laplace trans formation f algebraic rational fractions. The complete solution of one-dimensional problems concerning electrical and mechani cal systems. Certain properties of the Laplace transformation. The solution of linear difference equations with constant coefficients. Appendixes. Bibliography Index.

Note Invariant systems having lumped parameters, leading to ordinary integro-differential equations and difference equations are treated in this volume. The discussion progresses by easy stages. Emphasis is placed upon systematic presentation of the method of setting up physical problems in mathematical form. The mathematical procedure for solving problems is based on an extensive table of operation- and function-transformation pairs which is derived and used in much the same way as an ordinary table of integrals. A comparison is given of the Fourier and the Laplace-transformation methods. Ample references to the litera ture are provided for those who wish to go beyond the scope of this volume. The bibliography stresses the historical evolution of the mathematical techniques used. Many of the illustrative ex amples and the practice problems have a definite engineering background and have been selected from wide variety of topics ranging from surge generator transients to television synchronizing pulses, and to the behavior of a rotary stabilizer in motion picture film head.

GOLDMAN, STANFORD

Transformation calculus and electrical transients. New York Prentice-Hall Inc., 1949 439 p illus. 22 cm (Prentice-Hall elec trical engineering series W L. Everitt, edi tor) $7 50 6219

Contents Introduction. Determinants. Properties of electrical cir cuits. Transient solutions of circuit problems by means of the Laplace transformation. Some fundamental concepts and relations in circuit theory Theory of functions of complex variable. Loci of complex functions. The inversion theorem and related topics. Gamma and error functions. Bessel functions. Transients in trans mission lines—solution of partial differential equations. Solutions in series. Some additional applications to electrical engineering. Ap pendixes Tables of integrals; Table of identities involving hyper bolic functions. Basic theory of transmission lines in the steady state. Table of Laplace transforms. Fourier integral analysis. Index.

Note. An introductory book for electrical engineers in which the equations and theorems of transformation calculus are developed from the level of simultaneous equations. It is written at the level f seniors or graduat students in electrical engineering, and is not intended for persons without knowledge of calculus, some knowledge of engineering and an elementary knowledge of complex quanti and differential equations. The author has coined the phrase, "tran formation calculus, as differentiated from Heaviside's operation calculus, to cover the emphasis upon the question of transformatio between the t axis and the s plane. The subject is of particul importance to development and research workers in electrical eng neering.

GROVER, FREDERICK WARREN

Inductance calculations, working formula and tables New York D Van Nostrand Company, Inc., 1946 286 p illus. 24 cm $7 50 6220

Contents General principles. Methods of calculating inductance. Geometric mean distance. Construction of and method of using the collection of working formulas. Part I, Circuits whose elements are straight filaments: Parallel elements of equal length. Mutual induct ance of unequal parallel filaments. Mutual inductance of filaments inclined at an angle to each other Circuits composed of combina tions of straight wires. Mutual inductance of equal, parallel, coaxial polygons of wire. Inductance of single-layer coils on rectangular winding forms. Part II, Coils and other circuits composed of circular elements. Mutual inductance of coaxial filaments. Mutual inductance of coaxial circular coils. Self-inductance of circular coils of rectan gular cross section. Mutual inductance of solenoid and a coaxial circular filament. Mutual inductance of coaxial single-layer coils. Single-layer coils on cylindrical winding forms. Special types of single-layer coil. Mutual inductance of circular elements with paral lel axes. Mutual inductance of circular filaments whose axes are inclined to one another Mutual inductance of solenoids with in clined axes, and solenoids and circular coils with inclined axes. Cir cuit elements of larger cross sections with parallel axes. Auxiliary tables of functions which appear frequently in inductance formulas. Formulas for the calculation of the magnetic force between coils. High frequency formulas. References.

Note. The purpose of this book is to simplify routine calculations of mutual and self-inductance problems. The author furnishes for each case of the more important types of circuit elements single formula which includes numerical constants that may be interpolated from the book's special tables in which shape ratios are the argu ments.

GUILLEMIN ERNST A.

Introductory circuit theory New York John Wiley & Sons Inc., 1953 550 p illus. 24 cm. $8 50 6221

Contents. Network geometry and network variables. The equilib rium equations. Methods of solution and related topics. Circuit elements and source functions. Impulse and step-function response of simple circuits. Behavior of simple circuits in the sinusoidal steady state. Energy and power in the sinusoidal steady state. More general networks in the sinusoidal steady state. Additional topics dealing with steady-state and transient behavior of lumped linear circuits. Generalization of circuit equations and energy relations. Index.

Note. An engineering college textbook which has been written by an eminent authority on network analysis, who is faculty member of Massachusetts Institute of Technology It is the first of a planned series which will run to three or four volumes. The author points out the "bread-and-butter" importance of circuit theory to electrical engineers, and his own positive ideas about how it should be taught are delineated in the preface. Although he warns against any attempt to use this book as reference work the series when completed will probably become a standard treatise on electrical networks. Graduate electrical engineers are advised (by this reviewer) at least to skim this first volume.

GUILLEMIN, ERNST A

The mathematics of circuit analysis ex tensions to the mathematical training of electrical engineers. A publication of The Technology Press Massachusetts Institute of Technology New York John Wiley & Sons, Inc. 1949 590 p 24 cm. (Principles of elec trical engineering series) $8 00 6222

Contents. Determinants. Matrices. Linear transformations. Quad ratic forms. Vector analysis. Functions of complex variable. Fourier series and integrals. Index.

...into their symmetrical components. [illegible] the Kirchhoff equations that apply to the system. [illegible] The treatment is [illegible] and the book is primarily of interest to graduate [illegible] in electrical engineering.

MASON, WARREN PERRY

Electromechanical transducers and wave filters. Second edition. New York, D. Van Nostrand Company, Inc., 1948. 419 p. illus. 24 cm. (Bell Telephone Laboratories series) 6235
$5.50

Contents: Introduction. Electrical network theory. Applications of network theory to lumped mechanical systems. Acoustic [illegible]. Vibrations of [illegible]. Design of electromechanical [illegible]. Index of subjects.

Note: [illegible] This book describes the [illegible] electrical theory [illegible] of new material [illegible]

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. DEPARTMENT OF ELECTRICAL ENGINEERING

Electric circuits, a first course in circuit analysis for electrical engineers, by members of the staff of the Department of Electrical Engineering, Massachusetts Institute of Technology. New York, John Wiley & Sons, Inc., 1940. 782 p. illus. 23 cm. (Principles of electrical engineering series) $9.30 6236

Contents: Introduction. Table of symbols. [illegible] Elementary network theory. Transient [illegible] Elementary alternating-current theory. [illegible] Polyphase systems. Elementary theory of symmetrical components. [illegible] Appendixes. [illegible] Bibliography. Index.

Note: This volume is practical [illegible] The system of symbols [illegible] Tables of physical constants, [illegible] and standards, including [illegible] are added as appendixes. [illegible] bibliography concludes the book.

MORECOCK, EARLE MONROE

Alternating-current circuits. New York, McGraw-Hill Book Company, Inc., 1942. 175 p. 24 cm. (Rochester technical series) $3.30. 6237

Contents: Alternating-current waves and quantities. Vectors and [illegible] quantities. Single-phase systems. Polyphase systems. [illegible] Laboratory report writing. Instructions for plotting graphs. Table of natural trigonometric functions. Table of squares. Answers to problems. Index.

Note: A brief but thorough text for elementary courses, which assumes only the usual foundation in high school algebra and trigonometry together with an understanding of direct-current and [illegible] principles. Concepts usually explained with the aid of calculus are here presented graphically. Problems are presented for each major topic discussed, and laboratory instruction sheets are provided for each chapter.

MORECOCK, EARLE MONROE

Direct-current circuits. Second edition. New York, McGraw-Hill Book Company, Inc., 1953. 388 p. illus. 24 cm. $5.00. 6238

Contents: Electrical concepts and units. Diagrams and resistance combinations. Magnetism and electromagnetism. Instruments and methods for measuring potential difference and current. Instruments and methods for measuring resistance. Power and energy. Conductors and insulation. Batteries. Network circuits. The magnetic circuit. [illegible] Capacitance—electrostatics. Appendixes. Electromagnetic induction. Visual aids. Index. Answers to problems.

Note: A self-contained introductory textbook addressed to students with practical interests in electricity. It is suitable for use in self-instruction as well as in organized courses. [illegible] basic electric theory. The [illegible] first edition [illegible] published in 1944. Among the changes made in preparing this edition is the use throughout of the mks system of units. The author is head of the Electrical Department of Rochester Institute of Technology.

REED, MYRIL B

Alternating-current circuit theory. Second edition. New York, Harper & Brothers, 1956. 589 p. illus. 24 cm. $7.00 6239

Contents: [illegible] and vector representation of [illegible]. The current, voltage, power, [illegible]. Algebra of complex numbers. [illegible] Graphical methods of computation. [illegible] Polyphase [illegible] power systems. Symmetrical components. [illegible] Index.

Note: A substantial and thoroughly modern treatment for students in engineering colleges. [illegible] there are two parts as follows: [illegible] The first edition was published in 1944. [illegible] The changes include [illegible]

RICHARDSON, DONALD ELMER

Electrical network calculations, tabular methods of solution. New York, D. Van Nostrand Company, Inc., 1946. 210 p. illus. 23 cm. $7.30 6240

Contents: Kirchhoff's first law. Kirchhoff's second law. Tabular solution of algebraic equations. Tabular solution of electrical networks. [illegible] Appendixes. Bibliography.

Note: The mathematical system outlined in this text was devised by the author to simplify and facilitate the solution of electrical network problems. It provides for the tabulation and arithmetical [illegible]

leakage reactance, armature reaction. Transformers. The dynamo. Commutation. Alternating-current generators. Alternating-current motors. Direct-current generators. Direct-current motors. Efficiency and losses. Parallel operation of generators. Electrical applications and rates. Electrical illumination. Index.

Note A distinguishing feature of this engineering college text book is that alternating and direct current principles and machines are not treated in separate parts of the course but are considered together under appropriate subtopics. The uthors' original intention was to provide general but adequate exposition for engineering students not specializing in electrical engineering. However the book has had considerable use also in first courses offered to electrical engineering students. In contrast to the single volume format of the first edition, the present edition is published in two volumes; and there is newly added material on transformers and on electronics. The number of problems has been increased, and the material on machines reorganized.

KRAYBILL, EDWARD KREADY

Electric circuits for engineers New York The Macmillan Company, 1951 212 p illus. 25 cm. $4 75 6229

Contents: Part I, Basic considerations: General background. Part II, Cause: Electromotive force. Part III, Opposition Resistance. Inductance. Capacitance. Part IV Effect: Current flow through R, L, C. Effective values, vector representation. The algebra of complex numbers. Part V Application of (effect-cause/opposition) to electric circuits. Series circuits. Energy and power. Parallel circuits. Networks. Polyphase circuits. Appendixes. Index.

Note A very compact presentation of the fundamentals of steady-state electric circuit theory is given in this book, which is intended chiefly for engineers specializing in fields other than electrical engineering. Except for the first two chapters, there is little descriptive material. Instead, such concepts as networks are carefully defined, then the reader is shown how to analyze typical examples and how to make the necessary mathematical computations involved in the analysis. Analogies with other physical systems, for example between capacitors and mechanical springs, are used frequently in the exposition.

LE CORBEILLER, PHILIPPE

Matrix analysis of electric networks. Cambridge, Mass Harvard University Press New York John Wiley & Sons Inc. 1950 112 p 22 cm. (Harvard monographs in applied science. No 1) $3 50 6230

Contents Preliminary concepts. The mesh method of Kron. The node-pair method. The mixed method. Index.

Note. In this short book the methods of analysis of rotating electrical machinery originated by Gabriel Kron and expounded in his *Application f tensors to the analysis of rotating electrical machinery* 1938, 2 ed., 1942 and in his *Tensor analysis of networks* 1939 are presented in simpler form for the benefit f communications engineers who are not specialists in mathematics. The presentation relies upon matrix algebra and topology and the essential concepts of these two areas of mathematics are presented in the first chapter In the succeeding chapters the author shows how to apply the techniques of matrix algebra and topology to the analysis of the fundamental types of stationary electric networks.

LEPAGE, WILBUR R

Analysis of alternating-current circuits New York McGraw Hill Book Company, Inc. 1952 444 p illus 24 cm (McGraw Hill electrical and electronic engineering series F E Terman consulting editor) $7 00 6231

Contents Alternating-current systems. Introductory concepts. Metering and effective value. Symbolic treatment of sinusoids. Basic integrodifferential equations. Sinusoidal excitations. Power Applications of complex quantities. Network terminology and notation. Analysis of networks. Magnetic coupling. Polyphase systems. Variable-response networks. Nonsinusoidal periodic waves. Fourier series. Appendixes. Calculation of circuit parameters. D-c network analysis. Some trigonometric identities. Index.

Note: An introductory textbook for students of electrical engineering who have completed college courses in calculus, basic electrical engineering, and d-c circuit analysis. It covers the analysis of the steady state in lumped linear networks. Carefully worded definitions, rather full discussions, and a summary at the end of each chapter are features designed to aid comprehension on the pa[rt] of the reader

LEPAGE, WILBUR R, AND SAMUEL SEELY

General network analysis. New York McGraw Hill Book Company, Inc., 1952 516 p. illus. 24 cm. (McGraw Hill electrical and electronic engineering series Frederick E. Terman consulting editor) $9 00 6232

Contents. Complex quantities. Generalized network analysis. Network theorems. Magnetic coupling. Four-terminal networks. General properties of lumped networks. Selective networks. Polyphase systems and symmetrical components. Circuits with distributed properties. Impedance and admittance charts. Fourier series in circuit analysis. Transients in linear systems. The Fourier integral. Operational calculus. References. Appendixes. Index.

Note. A textbook designed for use in engineering colleges. It is introductory to the subject and so written that it is suitable for both students of communications engineering and power engineering. uthors are members f the Department of Electrical Engineeri[ng] Syracuse University

LOEW, EDGAR A.

Direct and alternating currents, theory a[nd] machinery Fourth edition. Assisted by F Bergseth New York McGraw Hill Bo[ok] Company Inc., 1954 637 p. illus. 23 c[m.] $7 50 623[3]

Contents (abridged) Part I, Direct currents. Current, electromotive force, and resistance. Resistance and conductance. Energy and power Magnetism and the magnetic field. Generated and induced voltages. The magnetic circuit—magnetic properties of iron and steel. Direct current ammeters and voltmeters. The electric field. The dynamo-electric machine. Motors and their characteristics. Electrolytic conduction and batteries. Direct-current distribution. Part II, Alternating currents. Alternating electromotive forces and currents—fundamental concepts. Phasor representation. Alternating-current meters. Power in single-phase circuits. Polyphase circuits. Transformers. Polyphase induction motors. Alternators. Synchronous motors and parallel operation of generators. Conversion equipment. Alternating current transmission and distribution. Electron tubes and rectifiers. Appendixes. Index.

Note. Fundamental principles and characteristics rather than description are emphasized in this book, which is used as textbook in engineering college courses. However broad field is covered, as indicated in the title. Alternating current circuit theory is discussed largely in terms of vectors. The first edition was published in 1931 and the third edition in 1946. The major change in the fourth edition is the use of the rationalized mks system of units. Also, several chapters were extensively rewritten; t chapters ere deleted, and the chapter on conversion equipment, that is, mechanical rectifiers, synchronous converters, etc., was added.

LYON, WALDO V

Transient analysis of alternating-current machinery an application of the method of symmetrical components. New York Published jointly by The Technology Press of Massachusetts Institute of Technology and John Wiley & Sons, Inc., 1954 310 p. illus. 24 cm. $7 00 6234

Contents. Static circuits. Symmetrical components of instantaneous potentials and currents. Differential equations for the ideal cylindrical-rotor machine. Transient conditions in the induction machine with stationary rotor. Transient conditions in the induction machine with speed constant. Uniform-air-gap machine with rotor excitation and with speed constant. Synchronous machine with salient poles, constant speed. Induction and synchronous machines with speed ariable. Appendix: Differential analyzer solutions. Bibliography Problems. Classified list of specific problems. Index.

Note. The distincti quality of this book lies in the application of Fortescue's methods of symmetrical components to the analysis of transients in rotating a-c machines. T use the author's words In the application of this method, Fortescue's, the ectors that represent the potentials and currents in the phases of an unbalanced

... students of both power and communications engineering. Completion of courses in calculus and algebra at the ... level is prerequisite, but the student is introduced to ... [illegible] in the book itself. In this edition, numerous ... and additions are apparent, most of them directed towards ... [illegible] on the part of the student. Also, the ... [illegible] is a new addition.

THOMPSON, HARRIS A.

Alternating-current and transient circuit analysis. New York McGraw Hill Book Company Inc., 1955 317 p. illus. 23 cm. (McGraw Hill electrical and electronic engineering series Frederick Emmons Terman, consulting editor) $6 75 6247

Contents: Elementary circuit concepts. General concepts and ... [illegible] algebra and phasors. Current, voltage, power, and energy relations. Use of phasors in steady-state circuit analysis. ... circuit analysis. Three-phase circuit analysis. Nonsinusoidal periodic waves. Transient analysis. Mathematical ... Index.

Note: A textbook for engineering college students in which the ... introduced to the main problems of a-c circuit analysis and ... modern techniques for solving them. Most of the book is devoted to steady-state analysis, but one chapter is devoted to ... of transient analysis. A fair number of solved problems ... included in the text, and there are about 300 problems for the student to work. The book is well organized and is written in ... style that points up the requirements and methods of ... without emphasizing too many details.

VAN VALKENBURG, M. E.

Network analysis. Englewood Cliffs N J Prentice Hall, Inc., 1955 440 p. illus. 24 cm. (Prentice-Hall electrical engineering series W L. Everitt, editor) $8.50 6248

Contents: Development of the circuit concept. Conventions for describing networks. Network equations. First-order differential equations. Initial conditions in networks. Differential equations, continued. The Laplace transformation. Topics in the time domain and the frequency domain. Impedance and admittance functions. Network functions. Sinusoidal steady-state analysis from pole-zero configurations. One-terminal-pair reactance networks. Two-terminal-pair ... networks (filters). Amplifier networks. Block diagrams. Stability in feedback systems. Index.

Note: A textbook designed to serve as an introduction to electric network analysis for junior and senior engineering students who will take additional courses in such areas as electric power systems, communication systems, and automatic control. As the chapter titles indicate, a number of topics are explored which a few years ago would have been deferred to graduate courses. The method of analysis taught ... that which permits descriptions of network functions in terms of poles, zeros, and ... scale factor. Selected lists of "further reading" are included in some of the chapters. Some graduate engineers may find the book useful as an introduction to the pole and zero approach.

WARE, L. A., AND G R. TOWN

Electrical transients. New York The Macmillan Company 1954 222 p. illus. 22 cm. $5.25 6249

Contents: Introduction. The Laplace transform. Simple applications of the transform. Compound, switching, and transition problems. The RLC circuit. A-c applied emf. Miscellaneous applied emf. Repeated and discontinuous emf functions. Vacuum-tube circuits. Appendices: Brief list of Laplace transforms. Theorems. Hyperbolic functions. Index.

Note: Although ... deals with the analysis of transient currents in electric circuits and, furthermore, uses the Laplace transform in the analysis, the book ... intended for use by undergraduate students of electrical engineering. The Laplace transform is used in ... manner which the authors designate as "quasi-rigorous." The classical method of analysis by the technique of differential equations is also used in some parts of the book. The senior author is Professor of Electrical Engineering in the State University of Iowa, and the co-author holds ... similar position at Iowa State College.

WEBER, ERNST

Electromagnetic fields theory and applications. Volume I Mapping of fields. New York John Wiley & Sons Inc. 1950 590 p. illus. 22 cm. $10 00 6250

Contents: The electrostatic field. The magnetostatic field. General field analogies. Fields of simple geometries. Experimental mapping methods. Field plotting methods. Two-dimensional analytic solutions. Three-dimensional analytic solutions. Appendices: Letter symbols for electrical quantities. Conversion tables for units. Review of fundamentals of vector analysis. General bibliography. On Bessel functions. On Legendre functions. Index.

Note: Although primarily an engineering college textbook written at the postgraduate level, this work is ... comprehensive treatment of field plotting in which mathematical, graphical, and experimental methods all are covered. Literature references are given as footnotes and in the general bibliography. The present volume deals with the mapping of static fields; ... second volume still to be published will cover the dynamic interaction of fields.

WEBER, ERNST

Linear transient analysis. New York John Wiley & Sons, Inc., 1954–56 2 v illus. 24 cm. Vol. I, $8.50 vol. II $10.50 6251

Contents: Volume I, Lumped-parameter two-terminal networks. The concepts of electric circuits and networks. Classical solutions of network response. Analogues. Operational calculus (Heaviside-Jeffreys). The Laplace transform method. The spectrum concept. Fourier integrals. Appendices. Index. Volume II, Two-terminal-pair networks—transmission lines: Introduction—the Fourier and Laplace transforms. Part I, Two-terminal pair networks (fourpoles). Passive fourpoles. Passive fourpole lines (wave filters). Idealized network characteristics (system theory). Active fourpoles. Part II, Transmission lines: Lossless and distortionless transmission lines. Nonuniform ... cables. General transmission lines. Appendices. Index.

Note: A cyclopedic treatment of all the useful methods of linear transient analysis of electrical networks is presented in this graduate-level text. The various methods are presented critically and in detail with the object of equipping the student to use any of them in practical work. Comparisons among the methods are included in such sections as Laplace transformation versus operational calculus. The cyclopedic character suits the book admirably to use by engineers out of college as well as by enrolled students. In both volumes selected literature ... cited in occasional footnotes, and the appendix contains ... general bibliography with brief annotations. The author is ... member of the faculty of Polytechnic Institute of Brooklyn.

POWER SYSTEMS

BECK EDWARD

Lightning protection for electric systems. New York McGraw Hill Book Company Inc., 1954 313 p. illus. 24 cm. $9.00 6252

Contents: The need for lightning protection. Lightning. Direct-stroke shielding. Impulse voltages and insulation. Lightning arresters—general. Expulsion arresters for the protection of transmission-line insulation. Lightning arresters for distribution-circuit protection. Station- and line-type lightning arresters for power apparatus. The protective and follow-current characteristics of lightning arresters for power and distribution apparatus, 2,400 volts and higher. The selection of an arrester. What does an arrester look? Location and application of lightning arresters. Protection of dry-type air-insulated equipment. Protection of rotating alternating-current machines. Some special applications of arresters. Protection for secondary and other low voltage circuits. Switching surges. The duty on lightning arresters in service. Protective grounds. Traveling waves. Index.

Note: Lightning arresters on electric power transmission lines are the main topic of this book. A short chapter on the characteristics of lightning is included as background information, and the chapters on shielding from direct strokes and on impulse voltages present briefly the two facets of the necessity for lightning protection. Lightning arresters are described as to type and performance characteristics, and their selection is discussed from the viewpoint of engineers responsible for the lightning-proofing of power systems. Economic considerations are not neglected; for instance, ... is pointed out that ... is usually better to risk damage to watthour meters in residential installations than to install an

sipulation of emf and resistance values of electrical networks, instead of solutions by algebraic equations. The six initial chapters give general description of the methods to be followed, while the remainder of the volume deals with their application to specific problems. *Numerous illustrative examples and problems are used to* supplement the textual material.

SISKIND, CHARLES S

Electrical circuits direct and alternating current. New York McGraw Hill Book Company, 1956 516 p illus 23 cm. $6 75 6241

Contents Part I, Electrical circuits—direct current Basic electrical ideas and units. Wires, cables, and insulation. Direct-current circuits—Ohm's law—power—energy—Kirchhoff's laws—basic theorems. Magnetism and magnetic fields. Magnetic circuits. Direct current instruments and measurements. Inductance and electromagnetic induction. Capacitance and dielectric circuits. Part II, Electrical circuits—alternating current Sinusoidal voltages and currents. Resistance (*R*) inductance (*L*) and capacitance (*C*) circuits. Parallel and series-parallel circuits. Resonance in series and parallel circuits. Circuit analysis by vector loci. Network laws, theorems, and principles. Coupled circuits and mutual induction. Alternating *current instruments and measurements. Polyphase circuits.* Nonsinusoidal waves. Appendixes. Visual aids. Index. Answers.

Note. A modern textbook organized so that it may be used both in engineering colleges and in technical institutes. T make this double use possible, the author did not derive equations in the main part of the ork, but segregated the derivations of them in the 16-page appendix. However even the main body of the book is not as elementary as might be expected. The approach is basic one ther is little descriptive material, and extensive use is made of algebra. The author is member of the faculty of Purdue University

SKILLING, HUGH HILDRETH

Electric transmission lines distributed constants, theory and applications. New York McGraw Hill Book Company, Inc, 1951 438 p illus 24 cm. (McGraw Hill electrical and electronic engineering series, F E. Terman consulting editor) $7 50 6242

Contents Part I, Theory The basic equations. Traveling waves. Standing wa es on low-loss lines. Lines with loss. Line parameters. Line constants, inductance and capacitance. Line constants resistance, skin-effect, and insulation loss. Artificial lines. Part II, Applications Application of transmission-line theory to telephone lines. Introduction to filters. Application to power lines. Application to radio-frequency lines. Introduction to wave guides. Part III, Transient tra eling wa es Traveling waves. Appendixes. Index.

Note An engineering college textbook in which all types of electric transmission lines from power lines to coaxial cables and hollow wave guides are treated. Somewhat more attention is given to lines designed for transmission and microwave frequencies than to other types of lines. The treatment is introductory to transmission lines, but familiarity on the part of the reader with ordinary circuit theory in olving lumped constants has been assumed. According to the uthor the material has been thoroughly tested in his own classes at Stanford University

SKILLING HUGH HILDRETH

Transient electric currents Second edition. New York McGraw Hill Book Company Inc 1952 361 p illus 24 cm (McGraw Hill electrical and electronics engineering series Frederick E Terman consulting editor) $7 50 6243

Contents The behavior of inductance. The beha ior of condensers. The circuit equations The complex single circuit. Networks. Response t alternating voltage. Coupled resonant circuits. Circuits with ariable parameters. Traveling waves. Laplace transformation. Index.

Note A textbook for advanced college students of electrical engineering and graduate engineers. It affords good basic treatment of simple transients. The chapter on the Laplace transformation is the chief addition [illegible] this second edition. The uthor is Professor of Electrical Engineering in Stanford University

SKRODER, CARL E, AND M STANLEY HELM

Circuit analysis by laboratory methods Second edition. Englewood Cliffs, N J Prentice Hall, Inc., 1955 376 p. illus. 24 cm (Prentice-Hall electrical engineering series W L Everitt, editor) $6 00 624

Contents. General laboratory instructions. The report. Circuit protection. Rheostats. Ammeters and voltmeters. Drop-of-potential methods for measuring D-C resistance. Current, resistance, and heat. Elementary study of the D-C shunt motor. Elementary study of the A-C generator Kirchhoff' laws. The electrodynamometer wattmeter Measurement of voltage, current, and power. Ohmic and effecti resistance. Determination of impedance and its components. The series circuit. The parallel circuit. Mutual inductance. Polyphase circuits. Measurement of polyphase power Measurement reactive voltamperes by means of wattmeters. Oscillographs. Nonsinusoidal periodic waves. Filters. Coupled circuits. Network theorems. Index.

Note Although this book is essentially laboratory manual for college students of electrical engineering, it is more than manual of laboratory procedures. In the typical chapter, considerably *more space is devoted to expounding the principles of the device* or circuit to be tested than is given to the descriptions procedures. The chapter on the electrodynamometer wattmeter for instance contains 16 pages of exposition of the theory of this instrument and only two pages of directions for laboratory experimental procedure. These preliminary expositions are written in a direct style that make them useful to graduate scientists and engineers in need of concise statements of fundamental information on circuit elements and circuits as well as to students. The first edition was published in 1946. This second edition is approximately one-fourth longer and contains proportionate amount of new material.

STEWART, JOHN L

Circuit theory and design. New York John Wiley & Sons, Inc., 1956 480 p illus. 23 cm $9 50 624

Contents Circuit analysis. The poles and zeros of functions The poles and zeros of networks. Elementary synthesis and numerical procedures. Some important gain functions. An introduction to modern synthesis. Image parameters. Conventional filters. The circuit representation of vacuum tubes. Low-pass amplifiers. Band-pass amplifiers. Feedback amplifiers and stability Oscillators. Servomechanism functions. References. Index.

Note The study and sy thesis of networks by pole-zero methods is taught in this engineering text The treatment assumes previous courses in calculus, circuit theory and vacuum tubes. Poles and zeros are introduced in the second chapter after review chapter on steady state circuit analysis. The Darlington method is introduced in the chapter entitled, An introduction to modern synthesis. In other chapters pole-zero methods are applied to vacuum tubes, amplifiers, feedback circuits etc. A well-selected and briefly annotated list of references is included at the end of the volume. Although primarily designed for use by advanced undergraduates and graduate college students of electrical engineering, the book is useful also t graduate electrical engineers in need of an introductory book on modern network theory and design.

TANG, KWAN YAU

Alternating-current circuits. Second edition. Scranton International Textbook Company 1951 605 p. illus 24 cm (International text books in electrical engineering Erwin E. Dreese consulting editor) $8 00 6246

Contents Alternating current and oltage Vector representation of sine waves. Elementary circuit concepts. Hypothetical circuits sinusoidal current and oltage Series circuit Complex quantities. Parallel circuits Series-parallel combination of elements. Real and apparent power Net ork theorems. Mutual induction and coupled circuits. T-sections of modified or equivalent coupled circuits. Impedance transformation Polyphase circuits. Power measurements in three-phase circuits Symmetrical components. Non-sinusoidal waves. Circuits with non-sinusoidal voltages and currents. Differential equations. Direct-current transients. Alternating-current transients. Transmission line calculations. Appendixes. Index.

Note An introductory textbook in the analysis of alternating current circuits. It is designed for use in upperclass undergraduate

Power Systems

DOLAND, JAMES J

Hydro power engineering a textbook for civil engineers. New York Ronald Press Company 1954 209 p. illus. 24 cm. $7.50. 6258

Contents. Water power development. The fundamentals of water power study. Analyses of data. Hydraulic turbines and their preliminary selection. Dimensions of water passages and powerhouse. [illegible] Economic aspects of hydroelectric [illegible]. Hydro-steam coordination. Problems. Index.

Note. A short but very practical introduction to the engineer's [illegible] planning and designing hydro-electric power installations. It [illegible] primarily to advanced college students of engineering [illegible], the reader is assumed to need no instruction in basic [illegible] fundamentals, and the space is devoted to matters of [illegible] power plant design. Most of the examples [illegible] and illustrated have been drawn from recent experience in the United States of America, particularly experience of the Tennessee Valley Authority and the Bureau of Reclamation.

DUNLAP CARL HARRY AND OTHERS

Transformers, principles and applications by Carl H. Dunlap W. A. Siefert, and Frank E. Austin. Chicago American Technical Society 1948. 277 p. illus. 22 cm. (Electrical series) $3.50. 6259

Contents. Transformer construction, by W. [illegible] F. E. Austin and C. H. Dunlap. Transformers, by W. A. Siefert. Design of small transformers, by F. E. Austin.

Note. Discussions of basic electrical principles are used in this [illegible] text to introduce the opening topics which deal with transformer core, coil, and lead structures. Transformer theory, connections, and operation are handled in the second part, while in the last section the reader is told how to calculate wire and core sizes and the number of turns that are necessary for building several types of transformers. The book is written in simple language easily understandable by the trade school students and practical [illegible] for whom it is intended.

DWIGHT HERBERT BRISTOL

Electrical elements of power transmission lines. New York The Macmillan Company 1954 188 p. 25 cm. $4.50. 6260

Contents. Short transmission lines. Hyperbolic solutions for long lines. General circuit constants. Circle diagrams for constant-voltage transmission lines. Load studies with networks. Short-circuit currents and stability. Traveling waves. Skin effect in round conductors. Cost of transmission lines. Current-carrying capacity and temperature rise. Geometric mean distance. Reactance. Capacitance. Some features of lightning protection. Sag calculations. Index.

Note. An engineering college textbook in which the electrical problems encountered in the practical design of power transmission lines are clearly expounded. The chapter titles given above show how the design process has been broken down into many separate elements. The typical chapter begins with a short, clearly written discussion of the particular problem. This discussion is then followed by one or more worked examples of problems. The derivation of useful formulas is shown. Finally the chapter concludes with problems for the student to solve. The author is a faculty member of the Massachusetts Institute of Technology.

KATES, EDGAR JESSE

Diesel-electric plants a practical text on the characteristics installation maintenance, and operation of Diesel-driven generators, including voltage regulators frequency and automatic controls. Second edition. Chicago American Technical Society 1945 272 p. illus. 22 cm. $4.00. 6261

Contents. Characteristics of Diesel engines. Alternating-current and direct-current generators for Diesel drive. Voltage regulation of direct-current generators. Voltage regulation of alternating-current generators. Parallel operation. Engine governors, including automatic control of frequency and load sharing. Self-operation of Diesel plants. Automatic controls and alarms for the Diesel engine. Electric starting of Diesel engines. Starting and stopping generators and voltage regulators. Installation and maintenance of generators and voltage regulators. Diesel-electric locomotives. Index.

Note. An outline of the mechanism and operating characteristics of Diesel engines and electric generators, as used in conjunction with each other. Intended for both vocational school students and operators of Diesel power plants, the material is mainly descriptive.

KIMBARK EDWARD WILSON

Power system stability New York John Wiley & Sons, Inc., 1948–56 3 v illus. 23 cm. Vols. I II $9.50 each vol. III $10.00 6262

Contents. Volume I. Elements of stability calculations: The stability problem. The swing equation and its solution. Solution of networks. The equal-area criterion for stability. Further consideration of the two-machine system. Solution of faulted three-phase networks. Typical stability studies. Index. Volume II. Power circuit breakers and protective relays. Fault clearing—power circuit breakers—protective relays. The influence of swinging and out-of-step operation upon protective relays. Rapid reclosing. Index. Volume III. Synchronous machines. Excitation systems. Damper windings and damping. Steady-state stability. Index.

Note. This work is a development of lectures given at Northwestern University in evening courses offered to graduate engineers and the clear, straightforward style of the lectures has been carried over to the books. The three volumes provide an authoritative and up-to-date view of the problem of power system stability with particular reference to methods of predicting stability characteristics in advance, of correcting conditions of instability in transmission systems already constructed, and of circuit breakers, protective relays, and synchronous machines. These devices are discussed principally from the standpoint of their stability and instability characteristics as part of the power system. Many illustrative examples are included in the expository matter. The second volume contains an extensive bibliography on circuit breakers, and literature references are also included in the other volumes.

KURTZ, EDWIN B

The lineman's handbook. Third edition. New York McGraw Hill Book Company Inc. 1955 740 p. illus. 21 cm. $10.00. 6263

Contents: Elementary electrical principles. The electric system. Distribution circuits. Line materials. Line equipments. Line protective equipment. Line-control equipment. Fundamentals of line design. Locating the staking line. Unloading, framing, and hauling poles. Erecting and setting poles. Guying poles. Mounting crossarms, pins, and insulators. Joining, stringing, and sagging conductors. Installing transformers and lightning arresters. Stringing secondary mains. Installing services. Tower-line erection. Patrolling and inspecting lines. Line testing. Field testing of line insulators. Live-line maintenance. Rural lines. REA manual of operation and maintenance practices of rural lines. Pole climbing. Rubber protective equipment. Rope, knots, splices, and gear. Tree trimming. Signals for line work. The prone-pressure method of resuscitation. Standard technique for executing the back pressure-arm lift method. Pole-top resuscitation. Accident-prevention course for linemen. First aid. Electrical formulas and calculations. Lineman's arithmetic. Self-testing questions and answers. Definitions of electrical terms. Index.

Note. A standard instruction manual and reference book for men who install and maintain transmission and distribution lines for electric power. It is suitable for use as a text in company-sponsored courses and also for reading for self-instruction. The second edition was published in 1942. In this third edition, the book has been reorganized in 33 sections. Some text and some illustrations have been carried over from the second edition, but needed revisions have been made, and much material has been added.

LEWIS WALTER WALLACE

The protection of transmission systems against lightning. New York John Wiley & Sons, Inc., 1950 418 p. illus. 24 cm. $12.00 6264

Contents. The accumulation of electricity in clouds. The mechanism of the lightning stroke. Voltage caused by lightning and switching. Current in the lightning stroke. Wave shape of lightning voltages and currents. Shielding by overhead ground wires and masts.

arrester, because of the relative costs. Little mathematics is used, and that which is present is rather simple. Good lists of literature references are included. The author is manager of the Lightning Arrester Engineering Section of the Westinghouse Electric Corporation.

BEEMAN, DONALD, editor

Industrial power systems handbook. New York McGraw Hill Book Company, Inc., 1955 971 p illus. 24 cm. $12 50 6253

Contents Short-circuit-current calculating procedures, by D Beeman and others. Symmetrical components as applied to short circuit-current calculation on three-phase systems, by R. H. Kaufmann. Selection of A-C short-circuit protective devices and circuit equipment, by D. Beeman and R. H. Kaufmann. Voltage—standard ratings, allowable variations, reduction of variations, calculation of drops, by W R. Crites and M. N Halberg. System overvoltages—causes and protective measures, by R. H. Kaufmann and M. H. Halberg. System grounding, by L. J Carpenter and L. G. Levoy Jr Equipment grounding, by L. J Carpenter and others. Power factor improvement, by W C. Bloomquist. System overcurrent protection, by F P Brightman. Selection of system voltages, by D Beeman. Load-center power systems and circuit arrangements, by D Beeman. Secondary distribution systems, by S. C. Cook, Jr. Primary power systems, by N C. Hadley Power systems for commercial buildings, by D S. Brereton. Modernization and expansion of existing power systems, by D Beeman and L. G. Levoy Jr Steam and power generation, by W B. Wilson. Load- and cost-estimating data, by D S. Brereton. Appendix, compiled by D B. Armstrong. Index.

Note. An engineering handbook edited and written by staff members of the Industrial Engineering Section of the General Electric Company It covers power generation, transmission and distribution systems for industrial establishments, such as factories. Design considerations are emphasized, but the book includes also much information of value to the plant engineer who is responsible only for the maintenance program. Troubles that can occur because of inadequate or improper grounding are an example of such material. Included are not only expected material on protective devices, etc., but also information on less-obvious design matters, such as the inclusion of remote controls for lighting. Some illustrations of commercially available equipment are included, but they are not a prominent feature of the volume, and the book is not intended as a guide to such equipment except in a general way Although organized as a reference handbook and including a wide range of reference data, most of the chapters are designed to be read rather than kept at a desk for occasional reference.

BEWLEY, LOYAL VIVIAN

Traveling waves on transmission systems. Second edition New York John Wiley & Sons Inc, 1951 543 p illus. 24 cm $14 50 6254

Contents (abridged) Part I, The origin, characteristics, and behavior of travelling waves. The line equations. The shape, attenuation, and distortion of waves. Reflection of travelling waves. Lightning. Traveling waves on multiconductor systems. Transition points on multiconductor circuits. Multivelocity waves. Theory of ground wires. The counterpoise. Induced lightning surges. Switching surges. Protection of transmission systems against surges. Part II, High-frequency oscillations and terminal transients of transformers Ideal two-winding transformers. Waves of arbitrary shape applied at one or both terminals. Terminal transients. Suppression of internal oscillations by electrostatic shielding. Appendix. Index.

Note An important work for electrical engineers concerned with the protection of electric power transmission lines and transformers against lightning and voltage surges caused by switching. Theories and design procedures are covered from the standpoint of their practical use. The book is organized so that it may be used as a textbook. However the writing is essentially on a graduate level and is addressed to advanced students of electrical engineering and beginning graduate electrical engineers. The second edition contains about twice as much matter as the first edition.

BLOOMQUIST, WALTER CARL, editor

Capacitors for industry their selection, application and economics for power factor improvement of industrial plants by W C Bloomquist, C R. Craig R. M Partington and R. C Wilson. New York John Wiley & Sons, Inc., 1950 246 p illus. 24 cm. $6.0[0] 625[5]

Contents (abridged) Capacitor facts and fallacies. Power-fact[or] fundamentals. Instruments and measurements for power-factor st[udies]. Release of power-system capacity Voltage improvement. Pow[er] system losses. Power factor rate studies. Application of capacit[ors] to motors and generators. Harmonics and resonance switching; f[us]ing. Automatic-control equipment. Series capacitors. Capacitor stan[d]ards and operating characteristics. Capacitor ratings, estimati[ng] prices, types of equipment. Capacitor installation and maintenanc[e]. Selected bibliography Appendix. Index.

Note. A practical discussion for plant electrical engineers, electr[i]cians, and others who are concerned with the electric power install[a]tions in factories and other industrial establishments. The econom[ic] and engineering aspects of capacitors in such systems are discuss[ed] compactly and authoritatively Problems, such as occur in design[ing] a power system with capacitors or installing capacitors in an esta[b]lished system, are worked out in step-by-step detail. Much engineer[ing] data are presented in tables and graphs. There is a useful anno[]tated bibliography

BLUME, LOUIS FREDERICK, AND OTHERS

Transformer engineering, a treatise on th[e] theory, operation, and application of trans[]formers, by the late L. F Blume, A Boyajian G Camilli, T C. Lennox, S Minneci, V M Montsinger Second edition New York Joh[n] Wiley & Sons, Inc., 1951 500 p. illus. 24 cm $12 00 625[6]

Contents (abridged) The general nature of transformer problems. Excitation characteristics of the transformer exciting current and core loss. Non-triple harmonic phenomena due to transformer exciting current. Impedance characteristics of transformers. Impedance characteristics of multicircuit transformers. Short-circuit currents and voltages by the method of symmetrical components. Transformer connections. Auto-transformer connections. Thermal characteristics of transformers. Characteristics of transformer circuits for changing ratio under load. Automatic operation of voltage-control equipment. Phase-angle control. Characteristics of insulation. Voltage stresses in auto-transformers in Y-connection. Transient voltage characteristics of transformers. Insulation coordination of transformers. Index.

Note. A substantial, detailed treatise designed for electrical engineers and other technically trained men whose work involves the specification, selection or operation of transformers. The emphasis is on basic matters rather than descriptive data. At the time of writing, the authors were all associated with the Transformer Engineering Division of the General Electric Company Although most of the text of the present edition has been carried over from the first edition, important changes have been made, particularly in the discussions of thermal characteristics and insulation.

CRARY, SELDEN BRONSON

Power system stability New York John Wiley & Sons, Inc., 1945–47 2 v illus. 22 cm. (General Electric series) $8 50 per vol. 6257

Contents: Volume I, Steady state stability Power flow Synchronous machine power angle characteristics. Stability limits. Composite systems. Equivalent reactance of synchronous machines. Application of stability criterion C Long distance power transmission. Stability characteristics of turbine generators. Transmission line comparative electrical loadings. Straightaway transmission line. Voltage economic study System design. Special cases. Appendix. Index. Volume II, Transient stability Fundamental concepts for transient analysis. Synchronous machine torque angle characteristics. System torque angle characteristics. Two-machine stability Multi-machine problem. Generator characteristics—methods of analysis. Generator stability System design characteristics. High-speed reclosing circuit breakers. Overall stability Appendix. Bibliography Index.

Note. The fundamental theory of electric generating and transmission systems, under both normal and abnormal operating conditions, is thoroughly discussed in this work for electrical engineers. The first volume deals with the influences of small or gradual changes on electrical states of equilibrium, and the second with the effects of large or sudden changes. An important feature of the work is its wealth of bibliographical material, which includes both chapter references and an extensive selective bibliography of literature published during the years 1894–1941.

has not been published before. The long bibliography includes an author index of the cited papers and also a chronologically arranged list of references beginning with 1800 and including two publications [illegible].

Powel, Charles A.

Principles of electric utility engineering. New York. Published jointly by The Technology Press of The Massachusetts Institute of Technology and John Wiley & Sons, Inc., 1955. 251 p. illus. 24 cm. $6.00. 6271

Contents: Corporate organization, objectives, and finance. Sources of energy from generating stations. Generating-station auxiliaries. Hydroelectric generating stations. Transmission of energy. Transmission equipment. Power-system fault control. Lightning phenomena and insulation coordination. Transmission systems. Power-system relaying. Power distribution. Index.

Note: An informative survey written from the standpoint of electrical engineering students, and engineers who are not directly concerned with electric utility engineering but who need a general technical knowledge of it. Some legal, economic and management aspects, such as franchises, governmental control and production costs, are discussed in the first chapter. In the chapter devoted to power economy, engineering problems, objectives and techniques are treated concisely but in sufficient detail to inform engineering students on current techniques and the operating principles of devices and machines. Special terminology such as "load diversity" are explained with care. There are no literature references.

Rothe, Frederick S

An introduction to power system analysis. New York John Wiley & Sons, Inc., 1953 157 p. illus. 23 cm. $5.00. 6272

Contents: Equivalent circuits for single-phase two-winding transformers. Equivalent circuits for balanced three-phase systems. Fundamentals of symmetrical components. Sequence impedances of transformers and non-transformers. Synchronous machine theory. Analysis of faults and suddenly applied loads at generator terminals. Analysis of faults and suddenly applied loads on systems. Use of Cable components in system analysis. Sequence impedances of overhead transmission lines. Steady-state transmission line theory. Fundamentals of power system stability. Index.

Note: Addressed to advanced students of electrical engineering and to graduate power system engineers, this book is a compact [illegible] of methods of power system analysis which are currently [illegible]. The author has included only practical methods, furthermore, he has simplified them so as to make them available to the engineer not [illegible] specialist in power system analysis, who is [illegible] responsible for the economic design of power systems. The power system is broken down into its main components: [illegible], transformers and loads. In turn, the components are analyzed by simplified methods, for example, the equivalent circuit [illegible] used in treating transformers. A-c and d-c network analyzers are mentioned, but the book does not cover methods which depend on the use of these complex instruments. The numerous worked examples included will be appreciated by the engineer who wants to study the subject or brush up on [illegible] without the aid of an instructor.

Rüdenberg Reinhold

Transient performance of electric power systems phenomena in lumped networks. New York McGraw Hill Book Company Inc., 1950. 832 p. illus. 23 cm. (McGraw Hill electrical and electronic engineering series F E. Terman, consulting editor) $13.00. 6273

Contents (abridged): A. Transient performance of lumped linear circuits. Part I, Simple electric circuits. Switching on and off self-inductive circuits. Charging and discharging capacitive circuits. General laws of switching. Transient state of oscillatory circuits. Part II, Magnetically linked circuits. Mutual induction in circuits at rest. Switching of transformers. Commutation flux in rotating machinery. Mechanical and thermal short-circuit effects. Part III, Inertia effects of rotating masses. Acceleration of machinery. Starting of induction motors. Mechanical oscillations in alternating-current machinery. Impacts on synchronous machines from switching. Part IV, Influence of the earth: Ground-fault currents in insulated systems. Atmospheric fields above the line. Electrostatic induction on adjacent lines. Return currents under transmission lines. Inductive interference with communication lines. B. Performance of circuits of nonlinear characteristics. Part [illegible] Variable resistance. Heating of cooled conductors. Melting of fuse wires. Part VI, Interruption by electric arcs: Interruption of alternating current. Three-phase interruption. Natural oscillations sustained by arcs. Part VII, Magnetic saturation in circuits at rest. Switching of saturated direct-current circuits. Higher harmonics. Nonharmonic oscillations. Part VIII, Saturated rotating machinery. Bibliography. Index. Tables of functions.

Note: A thorough treatment of phenomena rising out of short circuits, lightning, and many other varieties of disturbances in electric power distribution systems. The original edition, published in Germany before World War II, gained an international reputation among engineers. This edition, which has been written directly in English by the author, is more comprehensive than the German edition and covers the developments since 1933. Mathematical parts of the exposition are well buttressed with [illegible] and illustrative matter. The book is addressed to advanced students of electrical engineering and practicing electrical engineers.

Skrotzki Bernhardt G A. editor

Electric system operation. New York Mc Graw Hill Book Company 1954 370 p. illus. 24 cm. $6.50. 6274

Contents: The system, by W. C. Astley. Relays, by E. L. Michelson. Load dispatching, by M. J. Steinberg. Frequency and load control, by E. L. Michelson. System communications, by E. E. Paige. Station performance, by M. J. Steinberg. Economy loading, by M. J. Steinberg. System-operating costs, by M. J. Steinberg. Rate schedules, by M. J. Steinberg. Index.

—— Electric transmission and distribution. New York McGraw Hill Book Company 1954 448 p. illus. 24 cm. $7.50. 6275

Contents: Electrical theory, by E. M. Adkins. Transmission terminal facilities, by F. S. Benton. Transmission lines, by F. S. Benton. Distribution systems—mechanical arrangements—primary and secondary—capacitors and transformers—protection, by E. M. Adkins. Street lighting. Planning and load characteristics, by E. M. Adkins. Auxiliaries, by E. L. Michelson. Appendix. Index.

Note: Although they cover some rather advanced topics, these books are written at an elementary level. Such chapters as that on electrical theory in the volume listed second above assume no previous knowledge of electricity or physics and include no mathematics more advanced than high school algebra. The ideas and terms found in such chapters as those on capacitors and transformers are necessarily more technical. Nevertheless, even in those chapters the elementary level is essentially maintained. The authors of the various chapters are all electrical engineers associated with utility companies; but the books are addressed to technicians rather than to engineers, especially such persons as electricians, linemen, and operating personnel employed by the electric utility companies. There are two additional volumes in the series: *Electric generation—steam stations*, and *Electric generation—hydro, diesel and gas turbine stations*, both published in 1956 and priced at $8.00 each.

Steinberg Max Jacob, and Theodore H. Smith

Economy loading of power plants and electric systems. New York John Wiley & Sons Inc., 1943 203 p. illus. 23 cm. $6.50 6276

Contents: Introduction. Theory of incremental rates. Load division in the boiler room. Load division in the turbine room. Load division in the generating station. System load division. Adjustment of computed performance curves. Index.

Note: A thorough discussion, both nonmathematical and mathematical, of the incremental rate theory. The theoretical aspects are given due consideration, together with the extent to which they can be modified in the interest of simplification. The book derives the mathematical conditions for obtaining maximum overall efficiency by the loading of equipment in parallel operation. Then it applies incremental rates in the academic solution of load-division problems. It describes limitations in the application of the incremental rate theory. Finally it gives the practical solution of load-division problems. Numerous sample illustrations show how the principles may be applied. A station-loading slide rule is described.

Means for obtaining low tower footing resistance. Insulation and spacing of conductors. Alternative methods of protecting transmission lines. Protection of stations and rotating machines. Grounding the neutral. Appendixes Effect of altitude and humidity on flash-over Calculation of capacitance of transmission lines. Index.

Note. A compact presentation of information about lightning and how electrical transmission systems are protected against it. It is addressed mainly to graduate electrical engineers who are concerned with the design or maintenance of power lines and systems. The important theoretical knowledge is stated concisely and the operating principles of the chief protective devices are clearly explained. Each chapter is supplemented by lists of related literature.

LOVELL, ALFRED HENRY

Generating stations, economic elements of electrical design Fourth edition New York McGraw Hill Book Company, Inc., 1951 431 p illus 24 cm $9 00 6265

Contents Elementary principles of corporate finance. Cost of stations. Economic decay Power-plant load curves. Economic conductor section—power distribution systems. Power plant location. Bus systems and current-limiting reactors. Generating station auxiliaries. Circuit breakers and their applications. Introduction to single-phase short circuits. Protective relays and their applications. Transmission lines with synchronous condensers.

Note An engineering college textbook in which the student preparing for career in power-plant design is introduced to the economic aspects of this field. Corporate finance is discussed briefly in the first chapter but the remainder of the book deals with matters that are of more direct concern to engineers—such as the economics of load curves, the economics of conductor sizes, etc. Not all of the text has been changed, but revisions have been made wherever required, as in the discussion of holding companies, fuel, circuit breakers, etc.

MARBURY, R. E

Power capacitors. New York McGraw Hill Book Company, Inc., 1949 205 p. illus 24 cm $5 00 6266

Content Capacitor materials and characteristics. Capacitor rating, design, and manufacture. Industrial, high-frequency and d-c power capacitors. Application of shunt capacitors to industrial power circuits. Application of shunt capacitors to utility systems. Fuses, switches, and connections used with shunt capacitors. Automatic control of capacitor kvar Series capacitors for line-reactance compensations. Series capacitors directly applied to specific industrial loads. Capacitor installation and maintenance. Index.

Note A review of the uses and applications of large-scale capacitors or condensers in electric power systems. The design, construction, and operation of capacitors are described but the author who was associated with the Westinghouse Electric Corporation at the time of writing, is concerned primarily with showing how power capacitors may be selected and utilized to solve various power problems.

MASON C RUSSELL

The art and science of protective relaying New York John Wiley & Sons, Inc. 1956 410 p illus 24 cm (General Electric series) $12 00 6267

Content The philosophy of protective relaying. Fundamental relay-operating principles and characteristics. Current, voltage, directional, current (or voltage)-balance, and differential relays. Distance relays. Distance relays. Wire-pilot relays. Carrier-current-pilot and microwave-pilot relays. Current transformers Voltage transformers. Methods for analyzing, generalizing, and visualizing relay response A-C generator and motor protection. Transformer protection Bus protection. Line protection with overcurrent relays. Line protection with distance relays. Line protection with pilot relays. Index.

Note. The use of relays in the protection of electric power systems against electrical failures is the subject treated in this book. The author has assumed that his readers will be graduate electrical engineers with knowledge of electrical engineering terminology and fundamentals, but will be novices in the specialized area of protective relaying. The engineering approach to the field and the principles and characteristics of relays are covered in outline form in the first two chapters. A block of chapters follows in which the types of relays used in protective relaying are described with particular attention to the characteristics of each ty Transformers used to actuate relays are covered next. The l six chapters are devoted to the role of relays in the protectio specific parts of the power system. Although some mathematic used, the book is devoid of advanced mathematical analysis. O the other hand, it abounds in information of practical value t engineers who are concerned with the protection of electrical pow systems. Extensive bibliographies are included in the chapters.

MATHEWS, P

Protective current transformers and cir cuits. New York The Macmillan Company, 1955 253 p illus. 22 cm. $8 00 6268

Contents Linear theory of current transformation in steady state conditions. Steady state ferromagnetic theory Zonal protective steady state theory of summation type. Some special applications. General design considerations. Testing. Transient fault currents. Linear theory of transient current transformation. Ferromagnetic effects in C.T.s with transient primary currents. Ferromagnetic effects in current summation types of protection. Appendixes. Index.

Note. The analysis of current transformers designed for use with protective devices on electric power transmission and distribution systems forms the subject of this book. Such transformers are used chiefly to operate trip coils and relays. The chapters fall essentially into two groups. The first group is devoted to analy and design for steady state conditions and the second to analys of the performance of current transformers subjected to transie currents. The book is addressed to graduate electrical engine engaged in design of power distribution equipment. It include excellent lists of literature references.

MORSE, FREDERICK T

Power plant engineering the theory and practice of stationary electric generating plants Third edition. Princeton D Van Nostrand Company, Inc., 1953 687 p. illus. 24 cm $8 75 6269

Contents. Introduction. The variable load problem. Power plant economics. The power plant building. Fuels and combustion. Internal combustion engine power plant. Gas turbine power plant. Vapor cycles. Energy flow in the steam power plant. Steam generators. Steam prime movers. The gas loop. The feedwater loop The piping system. Instrumentation. Bibliography Appendix. Index.

Note. A textbook which has been used in engineering schools courses in the United States of America since the publication of the first edition in 1932. It introduces the reader to the principles governing the layout of power plants and the design of their equipment It includes also much description of power plant machinery The second edition was published in 1942 under the title *Power plant engineering and design.* This third edition under a modified title represents such an extensive revision that it is essentially a new book. However the practical style of the original editions has been retained. There are several hundred illustrations. The bibliography is a selected list of books, journal articles and manufacturers' literature designed as a guide to further reading rather than to support the text.

PETERSON HAROLD A

Transients in power systems. New York John Wiley & Sons Inc. 1951 361 p 24 cm $9 50 627

Contents Overvoltages during power system faults. Effect of ... ency on overvoltages during faults. System voltage recovery char acteristics—fundamental concepts. System voltage recovery characte istics—miniature-system approach Effects of arc restriking on re covery voltage. Switching surges—capacitance circuits. Switching surges and overvoltage arrester discharge requirements. Overvoltage caused by sudden loss of load. Overvoltages caused by open conductors. Some additional non-linear circuits. Appendix Nomenclature. Equations for differential analyzer Equations for calculation of overvoltages Equivalent circuits for various types of faults. Bibliography. Index.

Note An advanced book for graduate students preparing for work in the design of power systems and for graduate engineers already at work in this field. Modern methods of analysis including the transient analyzer and the differential analyzer are covered. According to the author a considerable part of the information included

ELECTRIC MACHINERY

ALGER, PHILIP LANGDON

The nature of polyphase induction machines. New York John Wiley & Sons, Inc., 1951. 397 p. illus. 24 cm. $9.50. 6283

Contents: Basic principles. Circuit analysis. The revolving magnetic field. The polyphase induction motor. Polyphase induction motor performance calculations. Design of induction machines. Reactance calculations. Speed-torque-current relations. Crawling and [illegible]. Magnetic noise and voltage ripple. Rating and application of polyphase induction motors. Kron's generalized equivalent circuit. Index.

Note: The polyphase induction motor—aptly described as the workhorse of American industry—is the main topic in this book. Its theory, characteristics, and performance are studied from the standpoint of engineering analysis and design. All aspects that are of [illegible] the designer of motors are discussed, including such [illegible]. The book will be of interest [illegible] to advanced engineering students who are preparing for careers in motor design and to graduate engineers beginning work in the field.

ANDERSON, EDWIN P

Audels home appliance service guide electrical troubleshooting repairs. New York Theo. Audel & Company 1954 824 p. illus. 17 cm. $6.00. 6284

Contents: Fundamental electricity. Measurement of electricity. Ohm's law and circuit fundamentals. Appliance testing instruments. [illegible] Home wiring. Electric irons. Electric toasters. [illegible] Electric waffle bakers. Electric roasters, heaters, and broilers. Electric coffee makers. Electric space heaters. Automatic electric water heaters. Electric ranges. Fractional horsepower motors. Electric fans. Electric fans and blowers. Electric vacuum cleaners. Electric washing machines. Automatic clothes dryers (electric and gas). Electric ironers. Electric dehumidifiers. Garbage disposers. Oil burners. Household electric refrigerators. Room air conditioners. Gas appliances. Gas [illegible]. Gas appliance tests. Gas appliances. Gas ranges. Gas fired furnaces. Gas fired water heating systems. Gas fired water heaters. Bottled gas appliances. Index.

Note: No book on the repairing of electrical household appliances can cover in detail the repairing of all current makes of all types of appliances used in homes in the United States of America, and the author of this book has not attempted to do so. Instead, he has discussed principles and common mechanisms and the details of one or more representative makes of each type. The book is addressed to the practical man who is preparing for the trade of repairing household appliances. For such readers it serves as [illegible] of the field and as [illegible] for the use of manufacturers' manuals.

ANNETT FRED A., AND A. C ROE

Connecting and testing direct-current machines. Third edition. New York McGraw Hill Book Company Inc., 1955 313 p. illus. 24 cm. $6.50 6285

Contents: Part I, Reconnecting direct-current machines. Classification of coils according to their positions. Types of windings—lap windings. Types of windings—wave winding. Fractional-pitch windings. Taking winding data on armatures. Types of armature coils and how they are made. Reconnecting for changes in voltage. Reconnecting for change in speed. Reconnecting for change in speed and voltage. Changing [illegible] motor to [illegible] or [illegible] to [illegible]. Changing [illegible] direct-current generator into [illegible] motor or vice versa. Figuring [illegible] new winding for an old direct-current machine. Increasing machine ratings by changing conductor sizes and insulation. How leads are arranged in wire-wound armature coils. Part II, Testing direct-current machines. Locating faults in armatures—general principles. Short-circuits in armature windings. Open circuits in armature windings. Locating grounds in armatures. Locating reversed coils in armature windings. How to use an armature tester. Checking field-coil connections and polarity. Locating faults in field coils. Testing lap-wound armatures with equalizer connections. What is good insulation? High-frequency-voltage testing of insulation, coils, and windings. Index.

Note: A practical manual of methods of re-connecting direct-current machines for changes in voltage and speed and of locating and repairing faults in armatures and field windings. A second edition was published in [illegible]. The scope and plan of the book are the same in this third edition, but some chapters have been completely rewritten, and major sections of others have been revised in order to adapt the book to advances in electrical insulation. Also, the short chapter formerly entitled "How to construct and use an armature-testing magnet," has been rewritten to include descriptions of commercially available growlers. A substantial fraction of the 210 figures are diagrams of windings.

ANNETT FRED A.

Electrical machinery a practical study course on installation operation and maintenance. Third edition. New York McGraw Hill Book Company Inc., 1950 458 p. illus. 22 cm. $6 50 6286

Contents: Magnets and magnetism. Fundamentals of the electric circuit. Ohm's law series and parallel circuits. Energy work and power. Complex circuits and effects of internal resistance. Electrical instruments. Methods of measuring resistance. Fundamental principles of dynamo-electric machinery. Direct-current machinery construction. Inductance and commutation. Types of direct-current generators. Direct-current generator characteristics. Losses in direct-current machinery. Direct-current motors. Types of direct-current motors. Locating position of brushes on commutator. Three-wire systems and how they may be obtained. Direct-current generators in parallel. Fundamental principles of alternating current. Measurement and addition of alternating voltages and currents. Two-phase and three-phase circuits. Operating alternators in parallel. Kilowatts, kilovolt-amperes and power factor. Transformers. Alternating-current motors. Starting alternating-current motors. Electronics and electron tubes. Electronic rectifiers. D-C motor speed control. Flame-failure protection and smoke-intensity indicators. Index.

Note: This book originated in [illegible] series of articles published in the periodical *Power* from January 1917 to December, 1919. The articles appeared under the general title, *The electrical study course*, and they were designed as self-instruction aids for beginners and workers in the electrical industries. The articles were revised and published in book form in 1921, and the book has been twice revised since without, however changing its original purpose. The second edition was published in 1938. Two chapters were deleted and four were added in preparing this third edition.

BEWLEY LOYAL VIVIAN

Alternating current machinery New York The Macmillan Company 1949 376 p. illus. 24 cm. $6 00. 6287

Contents: General principles and common features. The transformer. General principles of rotating machines. The polyphase induction motor. Single phase induction motor. Alternating current commutator machines. The synchronous generator and motor. The synchronous converter. Appendices. The distribution summations. Armature reaction. Permeance and flux density. Induced voltages. Index.

Note: The chief types of alternating current machines are treated analytically in this rather unusual textbook. Various methods of analysis are presented, although the author derives "general equations of voltage" and "a general equation of armature reaction which offer comparatively simple ways of analyzing any electrical machine. These equations are the high point of the presentation, but the book has [illegible] number of other features not often encountered in introductory textbooks. It was developed at Lehigh University where the author is head of the Electrical Engineering Department and Director of the Curriculum in Electrical Engineering.

BLALOCK GROVER CLEVELAND

Direct-current machinery New York McGraw Hill Book Company Inc., 1947 367 p. illus. 21 cm. $6.00. 6288

Contents: Electromagnetic induction. The dynamo. Armature windings. Commutation, armature reaction. Operation of generators. Generator characteristics. Direct-current motors. Motor control. Losses, efficiencies. Ratings, weights, and costs. Special types and applications. Testing and maintenance. Batteries. Visual aids. Index.

Note: In the introductory text, the exposition is relatively simple, and there is considerable emphasis on applications. Intended chiefly for junior students in engineering and technical schools, it should be useful, also, as [illegible] review book or self-instruction text. The discussion assumes that the reader will have had some groundwork in engineering mathematics and electrical theory

STEVENSON, WILLIAM D, JR

Elements of power system analysis. New York McGraw Hill Book Company, Inc., 1955 370 p illus 24 cm. (McGraw Hill electrical and electronic engineering series, Frederick Emmons Terman, consulting editor) $7 50 6277

Contents. General background. Inductance of transmission lines. Capacitance of transmission lines. Resistance and skin effect. Current and voltage relations on a transmission line. Generalized circuit constants. Circle diagrams. Representation of power systems. Symmetrical three-phase faults on synchronous machines. Symmetrical components. Unsymmetrical short circuits on an unloaded generator. Sequence impedances and sequence networks. Unsymmetrical faults on power systems. Unsymmetrical systems Power system stability Appendixes. Index.

Note A textbook for advanced undergraduate and first year graduate students of electrical engineering who are majoring in electric power It introduces the reader to present-day techniques of analyzing electric power systems to determine such characteristics as voltage, current, power factor and stability at various points of networks under specified conditions of normal operation. Both d-c and a-c calculating boards, or network analyzers, are described as to principles and uses, however the methods taught in the book are not dependent upon the use of these devices. The expository matter includes considerable number of fully worked examples of analysis. The author is Professor of Electrical Engineering in North Carolina State College.

SUNDE, ERLING DITLEF

Earth conduction effects in transmission systems New York D Van Nostrand Company, Inc., 1949 373 p. illus 24 cm. (The Bell Telephone Laboratories series) $9 00. 6278

Contents: Basic electromagnetic concepts and equations. Earth resistivity testing and analysis. Resistance of grounding arrangements. Mutual impedance of insulated earth-return conductors. Propagation characteristics of earth-return conductors. D-c earth conduction and corrosion protection. Power system earth conduction and inductive interference. Surge characteristics of earth-return conductors. Lightning protection of cable and transmission lines. Appendix Definitions and tables of functions. References. Index.

Note. Circuit disturbances in communication and power systems and the corrosion of buried metallic structures arise in some measure from the fact that in such systems the earth is utilized as return conductor This volume discusses the basic principles and methods of analysis of earth conduction effects as they may be applied in the solution of problems relating to the prevention of these disturbances and corrosive effects. The treatment which is highly theoretical and based largely on experimental studies conducted at the Bell Telephone Laboratories, is intended for professional communication engineers and graduate electrical engineering students. A selected seven-page bibliography is included.

TARBOUX JOSEPH GALLUCHAT

Electric power equipment. Third edition New York McGraw Hill Book Company, Inc, 1946 493 p illus. 22 cm. $8 50 6279

Contents General introduction. Types of power plants. Load graphs and their significance. Generating equipment. Synchronous generator excitation. Electrical power-plant circuit layouts. Transformers. Transformer connections Switchboards and switchboard layouts. Switching equipment. Switching and control devices. Meters and measurements. Short-circuit currents. Transmission-line calculation. Transmission-line installation. Protection of electrical systems. Transmission-line disturbances and protection. Substations. Distribution systems. Economics of electric service. Appendices Typical power-plant designs. Reports and problems. Experiments. Index.

Note. This work is designed primarily as textbook or reference book for students in electrical engineering who have already had fundamental course covering electrical circuits and machinery Into the volume has been gathered the essential elements to enable the student to "obtain 'a bird's-eye view' of the entire field of electrical power equipment from the point of generation to the customers' meter center In the third edition, the text has been revised at frequent intervals in order to cover changes and developments in the power-equipment field since the publication of the second edition in 1932 In order not to increase the size of the book, some material has been deleted. In some instances the discussion has been expanded in the interest of clarity as for examples in the chapters on Generating equipment, Synchronous generator excitation, and Transformers.

TARBOUX, JOSEPH GALLUCHAT

Introduction to electric power systems. Revised edition Scranton, Pa. The International Textbook Company, 1949 395 p. illus 21 cm. (International texts in electrical engineering, E E Dreese, consulting editor) $6 75 6280

Contents. Introduction. Resistance, inductance, and capacity Transmission line inductance. Inductance by geometric mean distances. Conductors with earth return. Transmission line capacity The long transmission line. Generalized circuit equations. Circle diagrams. Symmetrical components. Alternator impedances. Two winding transformer impedances. Short transmission line impedances. The long line impedances. Sequence networks. Short-circuit calculations of power networks. Three-winding transformers. Circuits for the measurement of component currents, voltages and power. Circuits with unbalanced impedances. Alternator transients. System stability. Transmission line surges. Problems. Appendices. Index.

Note. An undergraduate textbook based on lectures given by the author to students at the University of Tennessee. The subject is treated from the point of view of students he will eventually be concerned with the operation of power lines rather than with their design. Some topics are treated briefly in line with the author's aim of giving broad view of the subject. Problems for each chapter are given in the appendix, together with tables of hyperbolic, exponential and trigonometric functions, tables of cable sizes, and similar related information.

WEINBACH, MENDELL PENCO

Electric power transmission. New York The Macmillan Company, 1948 362 p illus. 24 cm. $6 75 6281

Contents: Circuit properties of transmission lines. Transmission line formulas. Applications of the transmission formulas. Equivalent circuits of transmission lines. Line with transformers. Voltage control of transmission systems. Steady state power limits. Faulted transmission systems. Transient stability System instability Appendices. Index.

Note: A first text in the subject for electrical engineering students who have had the required preliminary education in mathematics and electrical theory The problems of electric power transmission only are considered, and no attempt is made to describe such related matters as equipment, methods of installing transmission lines, etc. The approach is largely mathematical and each chapter illustrates methods of analyzing and solving particular type of transmission problem.

ZABORSZKY, JOHN, AND JOSEPH W RITTENHOUSE

Electric power transmission the power system in the steady state. New York The Ronald Press Company, 1954 676 p. illus. 24 cm $12.50 6282

Contents. Inductive reactances of transmission lines. Conductor resistance, skin effect, load-carrying capacity Capacitive reactance of transmission lines. Corona. Constants of underground cables. Transmission line with distributed constants. Performance of a power transmission line in the steady state. Steady performance calculations on the power system. Regulation of voltage in the power system. Load frequency regulation in the power system. Power system economy Appendixes. Index.

Note A substantial addition to the literature of electric power transmission systems. The authors are faculty members of the School of Mines and Metallurgy at the University of Missouri, and the book is organized for use as text. However, because of its thorough coverage and its inclusion of material not found in other texts and treatises, it is of value to graduate engineers who are actively engaged in the design or control of power systems. The authors claim the inclusion of important original material not previously published anywhere and they have also included much material hitherto available only in scattered articles. Excellent lists of literature references appear throughout the book.

FITZGERALD, ARTHUR EUGENE, AND CHARLES KINGSLEY JR.

Electric machinery an integrated treatment of a-c and d-c machines. New York McGraw-Hill Book Company Inc., 1952 [illegible] p. illus. 24 cm. (McGraw Hill electrical and electronic engineering series Frederick E. Terman, consulting editor) $8.50. 6295

Contents: Physical aspects of electromechanical energy conversion. Electromechanical-energy-conversion principles. Basic concepts of rotating machines. Introduction to machine analysis. D-c machines—analysis of performance. D-c machines—application aspects. Synchronous machines—analysis of performance—effects of saturation and salient poles. Polyphase induction machines. Fractional-horsepower a-c motors. Control-type generators and self-synchronous motors. Electrical transients in machines and systems of machines. Dynamics of electromechanically coupled systems. Appendix: Basic theory of transformers. Table of constants and conversion factors. Index.

Note: A new textbook designed for use by advanced undergraduate students of electrical engineering. In it is presented an unified study of rotating machines, based on the concept of interaction between the magnetic fields of stator and rotor. Steady-state conditions in the machine and its system are assumed in most of the book, but in the final chapter the reader is introduced to unbalanced transients such as arise in the starting of motors, the oscillations of synchronous machines, etc. The authors are members of the faculty of the Massachusetts Institute of Technology

GIBBS, J B.

Transformer principles and practice. Second edition. New York McGraw Hill Book Company Inc., 1950 236 p. illus. 23 cm. $3.00. 6296

Contents: Single-phase and three-phase transformers. Coils and [illegible]. Transformer cooling. Temperature indicators. Ratio adjustment. Transformer oil and Askarel. Maintaining oil quality. Mechanical forces in transformers. Transformer insulation and lightning protection. Transformer polarity. Parallel operation of transformers. Phase transformation. Special applications of standard transformers. Autotransformers. Phase transformation by autotransformers. Instrument transformers. Current-limiting reactors. Transformer testing. Care and operation of transformers. Transformer calculations. Index.

Note: A practical treatment of the principles, construction features, testing, connections and operation of transformers. It is designed for electricians and utility system technicians who are concerned with transformers in their work. Some elementary algebra is used, but generally speaking, the treatment is non-mathematical. The first edition was published in 1937. The book was reorganized, and one chapter was added in the second edition. The author is associated with the Westinghouse Electric Corporation

GRAHAM KENNARD CODVILLE

Small commutator motors. Chicago American Technical Society 1952 283 p. illus. 22 cm. $4.90. 6297

Contents: General theory of repulsion—motor operation. Armature windings. Winding hand-wound armatures. Repairing motors with form-wound coils. Types of repulsion motors. Accessory features of repulsion motor construction. Theory of direct-current motors. Winding direct-current motors. Assembly—trouble shooting direct-current motors. Index.

Note: A book for practical students studying in organized vocational courses or at home. It covers both a-c and d-c motors with commutators. The basic theory of such motors is explained simply but the main emphasis is on armature winding and other repair operations. The text is clearly written in simple language and is supplemented by a generous number of illustrations. Mathematics is almost wholly absent.

GREEN PHILIP T

Electrical testing and troubleshooting. New York The Industrial Press, 1956 191 p. illus. 23 cm. $4.00. 6298

Contents: Electrical symbols and drawings. Analyzing and charting controller operation. Troubleshooting test equipment. Insulation testing. Locating grounds. Electromagnet windings. D-c machine windings. Single-phase transformers. Phase sequence. Polyphase windings. Polyphase transformers. Polyphase induction motors. Synchronous machines. Power cable faults. Bearing lubrication.

Note: The locating and correcting of faults in electrical machinery and power cables of the kinds employed in marine and industrial electrical machinery installations are treated in this book. Although entirely self-contained, it is in effect supplementary to standard texts for electricians, in which the troubleshooting of motors, dynamos, etc., is treated. Many of the tests and troubleshooting procedures described can be performed with the weak currents supplied by standard magnetos or dry cells. The author gives credit for some of the material to men in the Canal Zone Unions 397 and 677 of the International Brotherhood of Electrical Workers. This source may explain the attention paid to d-c machinery and power cables. The book is clearly written and adequately illustrated, but there are no references to other literature.

HARWOOD PAISLEY B

Control of electric motors. Third edition. New York John Wiley & Sons Inc., 1952 538 p. illus. 24 cm. $9.50. 6299

Contents: Introduction. Wiring diagrams. Construction of control apparatus. Pilot devices and accessories. Direct-current contactors and relays. Automatic accelerating methods for direct-current motors. The direct-current shunt motor. Shunt field relays and rheostats. Adjustable-voltage controllers. Automatic regulating systems. The direct-current series motor. Two-motor drives. Dynamic braking hoist controllers. Alternating-current contactors and relays. Automatic accelerating methods for alternating-current motors. The polyphase squirrel-cage motor. The wound-rotor motor. Single-phase motors. The synchronous motor. Magnetically operated brakes. Resistor design. Tables. Index.

Note: A standard work which is used both as a text in engineering colleges and as a practical survey for engineers and other technical personnel in industry whose work requires a knowledge of controlling devices for motors. Information is included on the design, construction, and applications of controllers and on controlling elements and systems for various types of motors. The second edition was published in 1944. Many changes were made in both the text and illustrations, and much new matter was added in preparing this edition.

HEUMANN GERHART W

Magnetic control of industrial motors. Second edition. New York John Wiley & Sons, Inc., 1954 714 p. illus. 24 cm. $11.50 6300

Contents: Symbols and diagrams. Principles of direct-current motor operation. Principles of alternating-current motor operation. Direct current contactors and relays. Alternating-current contactors and relays. Accessories. Pilot devices. Electronic devices. Resistors and rheostats. Construction of control panels. Basic direct-current control circuits. Basic alternating-current control circuits. Amplidyne control circuits. Protection. Solenoids, thrustors, brakes. Manual controllers. General-purpose controllers. Direct-current intermittent-duty controllers. Alternating-current intermittent duty controllers. Maintenance of control equipment. Index.

Note: An authoritative book written by a member of the staff of the Industry Control Department of the General Electric Company. It is addressed primarily to engineers and, as the title indicates, it deals primarily with magnetic methods of controlling motors. It does not cover electronic methods, although a short chapter is included in which an outline of this class of motor control is given. The principles of magnetic controls are thoroughly covered, and the same can be said about the mechanical and electrical details of typical devices. The first edition was published in 1947 and was 580 pages in length. A substantial amount of material has been added to this second edition on new developments in magnetic controller design, NEMA standards, revised requirements of the National Electrical Code, etc.

HUBERT CHARLES I.

Preventive maintenance of electrical equipment preventive programs, trouble shooting emergency repairs, operating techniques. New York McGraw Hill Book Company Inc., 1955 214 p. illus. 24 cm. $4.00. 6301

Braymer, Daniel Harvey, and A. C Roe

Rewinding small motors, practical details of repair shop practice with step-by step procedure for rewinding all types and designs of fractional horsepower direct and alternating current motors. Third edition. New York McGraw Hill Book Company, Inc., 1949 422 p. illus. 24 cm. $6 00 6289

Contents (abridged) Part I, General data and direct-current armatures. Recording winding data and stripping direct-current armature. Back lead and machine loop windings. Special chorded split-pitch loop winding. Parallel two-coil loop winding. How to determine the position of the commutator on the shaft. Connecting up hand-wound armatures. Part II Rewinding procedure for small alternating-current single-phase motors: Information to record for small alternating-current motors before stripping them. How to make up a skein and wind it in small alternating-current stators. Rewinding small universal motors. Rewinding a compensated series motor Single-phase fan-motor windings. Three special alternating-current motors. Part III, Rewinding procedure for small alternating-current three-phase motors Rewinding small three-phase stators. Diamond to round end coils. Chord factors for three-phase windings. Overlap windings. Round end overlap silicone winding. Index.

Note. One of the standard shop books for motor repairmen and armature winders. In its present edition it is intended as a companion volume to C. G. Veinott's *Fractional horsepower electric motors* (see below) Together the two books provide a thorough coverage of small motors, such as are commonly used to drive vacuum cleaners, fans, domestic water pumps, etc. Revisions in the third edition of the present title are important and have to do with such matters as the newly developed insulating materials. As in previous editions, rewinding operations are described in specific detail.

Chute, George M

Electronic motor and welder controls. New York McGraw Hill Book Company, Inc., 1951 348 p illus. 24 cm $7 00 6290

Contents (abridged) Part I, Resistance welding controls: Basic welding controls. G-E sequence weld timers. G-E high-speed sequence combinations. Synchronous timing. G-E synchronous combinations. Slope control, temper welding and forge timing. G-E seam-welding controls. Westinghouse synchronous combinations. Welding with limited power supply Three-phase welding controls. Part II, Motor controls. Position controls. Photoelectric register controls. Motor-generator control of motor speed. The electronic amplidyne. The photoelectric tracer Rubber calendar control. Multicolor printing. Paper-machine control. Index.

Note. A practical book suitable for shop electricians, plant engineers, and others whose work includes the selection, installation, or maintenance of electronic controls for resistance welders and motor-operated machines. The general principles of such controls are discussed briefly but most of the book is devoted to specific descriptions of the mechanisms, circuits, and operation of standard commercial controls. More recent types of controls and, generally speaking, more explicit descriptions of them are provided in this book than in the author's *Electronic control of resistance welding* (1943) and *Electronics in industry* (1946)

Concordia, Charles

Synchronous machines theory and performance. New York John Wiley & Sons, Inc. 1951 224 p 23 cm $7 50 6291

Contents. Physical description of a synchronous machine. Mathematical description of synchronous machine. Steady-state, balanced, synchronous operation. Three-phase short-circuit current. Single-phase short-circuit current. Double-line-to-ground short circuit and sequential faults. Short-circuit torques. Starting torque. Voltage dip. Appendixes. References. Bibliography Index.

Note Most of the world's electric power is generated by synchronous generators and is turned back into work by other synchronous machines ranging in size from the small motors in electric clocks to the largest alternating-current motors in use in industry This book is devoted to the theory of the transient performance of such machines, that is their behavior under short-circuits, starting loads, etc. The subject is treated mathematically and the book's chief purpose is to aid graduate engineers in finding solutions by means of mathematics to new problems encountered in the design and operation of synchronous machines.

Crouse, William Harry

Electrical appliance servicing New York McGraw Hill Book Company, Inc., 1950. 854 p. illus. 24 cm $10 00 6292

Contents (abridged) Section 1 Fundamentals. Principles of electricity Physical principles. Magnetism and motors. Transformers, generators, and batteries. Home wiring. Section 2, Resistance-heating appliances: Electric heaters. Automatic electric waffle-bakers. Electric coffee makers. Electric irons. Electric toasters. Electric water heaters. Electric broilers and roasters. Electric ranges. Section 3, Motor-driven appliances Fans and blowers. Electric water pumps, lawn mowers, and floor waxers. Food mixers. Electric clocks. Vacuum cleaners. Electric ironers. Garbage disposers. Electric dishwashers. Electric washing machines. Automatic electric and gas clothes dryers. Sewing machines. Section 4, Refrigeration and air conditioning. Refrigerator service. Air conditioners. Appendixes. Index.

Note. A comprehensive book on the repair of household electrical appliances. It is written primarily for men who are in the business of repairing such appliances and for students who are preparing to enter the business. Its arrangement suits it for use either as a textbook in organized vocational courses or as a reference book. As might be expected, the information on a particular type and make of appliance is not as detailed as would be provided in a manufacturer's manual. However a better picture is given of general servicing procedures, and in many cases enough information is supplied to enable the service man to make repairs without consulting the manufacturer's manual.

Drinkall, Leon Ray, *and others*

Alternating current motors, operation, connection, and maintenance by L. R. Drinkall, Frank Hodik, and E T Groat. Chicago American Technical Society, 1948 367 p. illus. 22 cm (American Technical Society electrical series) $4 00 6293

Contents. Types of alternating-current motors, by L. R. Drinkall. Types of alternating-current generators, by L. R. Drinkall. Operating a.c. generators and motors, by J. A. Spencer and E. T. Groat. Universal motors, by H. E. Stafford. Repulsion-induction motors, by H. E. Stafford. Polyphase induction motors, by H. E. Stafford. Synchronous motors, by H. E. Stafford. Alternating-current motor starters, by G. O. Wilms. Controls for alternating-current motors, by Frank Hodik. Use of resistors for controlling motors, by Frank Hodik. Index.

Note. In this simplified, practical guide prepared for the use of motor operators and maintenance men, emphasis is placed on the general principles of operation and construction of a.c. motors, but specific types of motors are also described in detail. Trouble-shooting charts are included for simplifying the analysis and repair of breakdowns.

Dusenbery, H. Syril

Direct current motor manual. New York The Macmillan Company 1950. 275 p. illus. 22 cm. $4 50 6294

Contents. Basic principles. Frames and enclosures. Motor bearings. The motor field. The armature. Armature windings. Commutation. Commutator care. Motor brushes. Installing and maintaining brushes. Insulating materials. The series motor. The shunt motor. The compound motor. Selection and application. Testing motors. Motor troubles. Reconnecting direct current motors. Starting the motor. Motor protection. Stopping the motor. Reversing the motor. Basic speed control. The direct current generator. Variable voltage speed control. Regulating exciters. Electronic rectifiers. Electronic speed control. Control maintenance. Resistors and rheostats. Mechanical drives. Code requirements. Appendix of useful information. Glossary Index.

Note. A practical book for persons who are active in the installation, operation, and maintenance of modern direct current motors and associated control equipment. It contains, in addition to the material on motors, a good descriptive treatment of new electronic devices for rectification and speed control which has recently increased interest in direct current motors. Very little mathematics is employed. Tables of the physical properties of materials used in motors should be convenient for electricians and others employed in the practical end of the field.

FITZGERALD, ARTHUR EUGENE, AND CHARLES KINGSLEY, JR.

Electric machinery an integrated treatment of a-c and d-c machines. New York McGraw Hill Book Company Inc., 1952 491 p. illus. 24 cm. (McGraw Hill electrical and electronic engineering series Frederick E. Terman, consulting editor) $8.50 6295

Contents: Physical aspects of electromechanical energy conversion. Electromechanical-energy-conversion principles. Basic concepts of machine performance. Introduction to machine analysis. D-c machines—analysis of performance. D-c machines—application aspects. Synchronous machines—analysis of performance—effects of saturation and [illegible]. Polyphase induction machines. Fractional-horsepower a-c motors. Control-type generators and self-synchronous machines. Electrical transients in machines and systems of machines. Dynamics of electromechanically coupled systems. Appendix: Basic theory of transformers. Table of constants and conversion factors. Index.

Note: A new textbook designed for use by advanced undergraduate students of electrical engineering. In it is presented an integrated study of rotating machines, based on the concept of interaction between the magnetic fields of stator and rotor. Steady-state conditions in the machines and its systems are [illegible] in most of the book, but in the final chapter the reader is introduced to [illegible] such as arise in the starting of motors, the [illegible] of synchronous machines, etc. The authors are members of the faculty of the Massachusetts Institute of Technology.

GIBBS, J. B.

Transformer principles and practice. Second edition. New York McGraw Hill Book Company Inc., 1950. 236 p. illus. 23 cm. $3.00. 6296

Contents: Single-phase and three-phase transformers. Coils and [illegible]. Transformer cooling. Temperature indicators. [illegible]. Transformer oil and Askarel. Maintaining oil quality. [illegible] in transformers. Transformer insulation and lightning [illegible]. Transformer polarity. Parallel operation of transformers. [illegible] transformers. Special applications of standard transformers. [illegible]. Phase transformation by autotransformers. Instrument transformers. Current-limiting reactors. Transformer testing. [illegible] and operation of transformers. Transformer calculations. Index.

Note: A practical treatment of the principles, construction, [illegible], testing, connections and operation of transformers. It is designed for electricians and utility system technicians who are concerned with transformers in their work. Some elementary algebra is used, but generally speaking, the treatment is non-mathematical. The first edition was published in 1937. The book was reorganized, and one chapter was added in the second edition. The author is associated with the Westinghouse Electric Corporation.

GRAHAM, KENNARD COOVILLE

Small commutator motors. Chicago American Technical Society 1952 283 p. illus. 22 cm. $4.90 6297

Contents: General theory of repulsion—motor operation. Armature windings. Winding hand-wound armatures. Repairing motors with [illegible] coils. Types of repulsion motors. Accessory features of repulsion-motor construction. Theory of direct-current motors. Winding direct-current motors. Assembly—trouble shooting direct-current motors. Index.

Note: A book for practical students studying in organized vocational courses or at home. It covers both a-c and d-c motors with commutators. The basic theory of each motor is explained [illegible], but the main emphasis is on armature winding and other [illegible]. The text is clearly written in simple language and is supplemented by [illegible] number of illustrations. Mathematics is [illegible].

GREEN PHILIP T

Electrical testing and troubleshooting. New York The Industrial Press, 1956 191 p. illus. 23 cm. $4.00. 6298

Contents: Electrical symbols and drawings. Analyzing and charting controller operation. Troubleshooting test equipment. Insulation testing. Locating grounds. Electromagnet [illegible]. D-c machine windings. Single-phase transformers. Phase sequence. Polyphase transformers. Polyphase induction motors. Synchronous machines. Power cable faults. Bearing lubrication.

Note: The locating and correcting of faults in electrical machinery and power cables of the kinds employed in marine and industrial electrical machinery installations are treated in this book. Although entirely self-contained, it is in effect supplementary to standard texts for electricians, in which the troubleshooting of motors, dynamos, etc., is treated. Many of the tests and troubleshooting procedures described can be performed with the [illegible] currents supplied by [illegible] or dry cells. The author gives credit for most of the material to men in the Canal Zone Locals 397 and 677 of the International Brotherhood of Electrical Workers. This source may explain the attention paid to d-c machinery and power cables. The book is clearly written and adequately illustrated, but there are no references to other literature.

HARWOOD PAISLEY B

Control of electric motors. Third edition. New York John Wiley & Sons, Inc., 1952 538 p. illus. 24 cm. $9.50. 6299

Contents: Introduction. Wiring diagrams. Construction of control apparatus. Pilot devices and accessories. Direct-current contactors and relays. Automatic accelerating methods for direct-current motors. The direct-current shunt motor. Shunt field relays and rheostats. Adjustable-voltage controllers. Automatic regulating systems. The direct-current series motor. Two-motor drives. Dynamic braking hoist controllers. Alternating-current contactors and relays. Automatic accelerating methods for alternating-current motors. The polyphase squirrel-cage motor. The wound-rotor motor. Single-phase motors. The synchronous motor. Magnetically operated brakes. Resistor design. Tables. Index.

Note: A standard work which is used both as a text in engineering colleges and as a practical survey for engineers and other technical personnel in industry whose work requires knowledge of controlling devices for motors. Information is included on the design, construction, and applications of controllers and on controlling elements and systems for various types of motors. The second edition was published in 1944. Many changes were made in both the text and illustrations, and much new matter was added in preparing this edition.

HEUMANN GERHART W

Magnetic control of industrial motors. Second edition. New York John Wiley & Sons, Inc., 1954 714 p. illus. 24 cm. $11.50 6300

Contents: Symbols and diagrams. Principles of direct-current motor operation. Principles of alternating-current motor operation. Direct-current contactors and relays. Alternating-current contactors and relays. Accessories. Pilot devices. Electronic devices. Resistors and rheostats. Construction of control panels. Basic direct-current control circuits. Basic alternating-current control circuits. Amplidyne control circuits. Protection. Solenoids. Thrustors. Brakes. Manual controllers. General-purpose controllers. Direct-current intermittent-duty controllers. Alternating-current intermittent duty controllers. Maintenance of control equipment. Index.

Note: An authoritative book written by a member of the staff of the Industry Control Department of the General Electric Company. It is addressed primarily to engineers and, as the title indicates, it deals primarily with magnetic methods of controlling motors. It does not cover electronic methods, although a short chapter is included in [illegible] an outline of this class of motor control is given. The principles of magnetic controls are thoroughly covered, and the same can be said about the mechanical and electrical details of typical devices. The first edition was published in 1947 and was 580 pages in length. A substantial amount of material has been added in this second edition on new developments in magnetic controller design, NEMA standards, revised requirements of the National Electrical Code, etc.

HUBERT CHARLES I.

Preventive maintenance of electrical equipment preventive programs, trouble shooting, emergency repairs, operating techniques. New York McGraw Hill Book Company Inc. 1955 214 p. illus. 24 cm. $4.00. 6301

Contents Part I, Preventive maintenance: Insulation. Commutators—slip rings—brushes. Brush neutral. Transformers. Overload. Fuse protection of circuits and machines. Controllers. Disassembly of machines. Bearings. Industrial electronic apparatus. Fluorescent lights. Storage batteries. Fire fighting. Name-plate data. Spare parts. Bibliography Part II, Trouble shooting and emergency repairs: Operational difficulties. Field troubles. Armature troubles (direct current) Three-phase stator troubles. Squirrel-cage-rotor troubles. Wound-rotor troubles. Single-phase induction-motor troubles. Rebanding rotating apparatus. Motor-controller troubles. Capacitors. Instruments and tools for electrical maintenance and trouble shooting. Bibliography Part III, Operating techniques. Parallel operation of alternators. Parallel operation of direct-current generators. Operation of electric motors and controllers. Operation of transformers. Questions and problems. Identification of electrical apparatus. Appendix. Visual aids. Index.

Note. A practical book addressed to vocational school students, electricians and maintenance supervisors in plants and officers and technicians on ships. Both preventive maintenance and repairs to electrical machinery are covered explicitly Numerous trouble-shooting and repair operations are not only described but are shown in clearly reproduced illustrations.

JAMES, HENRY DUVALL, AND LEWIS EDWIN MARKLE

Controllers for electric motors, a treatise on the modern motor controller with typical applications to the industries Second edition New York McGraw Hill Book Company, Inc., 1952 426 p illus. 24 cm. $7 50 6302

Contents: Function and types of control. How to read controller diagrams. How to make controller diagrams. Magnetic contactors. Starting characteristics of motors with different methods of control. Methods of accelerating motors. Methods of speed control. Control for cranes, hoists, and other special applications. Mechanical and dynamic braking. Regeneration. Voltage control for direct-current motors. Amplifiers used for motor control. Magnetic amplifiers. Series-parallel control and the electro pneumatic contactor Adjustable-speed alternating-current motors of the wound-rotor type. Resistors. Manual controllers. Direct-current magnetic-contactor controllers. Alternating-current controllers. Synchronous-motor control. Electron-tube control. Remote and supervisory control. Protective devices. National codes, installation, and maintenance. Past and future control developments. Index.

Note. A standard book for electrical engineers and other technically trained persons who select or maintain motor control equipment. It does not cover the analysis of control problems but is, instead devoted to descriptions of types of controllers, their characteristics and applications. Although numerous examples of current United States of America makes of controllers are shown in the illustrations, the authors have not described the details of specific makes. For this edition the chapter on the control of crane and hoist motors was rewritten, and numerous additions covering recent developments in motor control were added in other chapters.

KATES, EDGAR JESSE, AND H E STAFFORD

Electric generators operation and maintenance Chicago American Technical Society 1948 268 p illus 22 cm. (American Technical Society electrical series) $3 50 6303

Contents Types of alternating-current generators, by L. R. Driskall. Operating a.c. generators and motors, by J. A. Spencer and E. T Groat. Voltage regulation of direct-current generators, by E. J Kates. Voltage regulation of alternating-current generators, by E. J Kates. Parallel operation, by E. J Kates. Management of hydroelectric machinery by H. E. Stafford.

Note A simplified, practical text and reference manual for power station operators, repairmen, and maintenance men. The chief purpose of the book is to provide information which will decrease breakdowns, save time in analyzing difficulties, and aid in making rapid repairs. The commonly occuring generator troubles are listed along with the probable causes and the remedies. Reader knowledge of the basic electrical principles is assumed.

KLOEFFLER, ROYCE GERALD AND OTHERS

Direct-current machinery by Royce G Kloeffler Russell M Kerchner and Jesse L Brenneman Revised edition. New York The Macmillan Company, 1948 395 p. illus. 24 cm. $5 75 6304

Contents. The dynamo. Dynamo principles. The dynamo magnetization curve. Armature windings. Armature reaction. Reactance voltage and commutating poles. Dynamo voltage characteristics. Operation of generators. Motor speed and torque characteristics. Starting and speed control of motors. The three-wire distribution system. Efficiency of dynamos. Testing of dynamos. Special direct-current machines and applications. Rating, weight, and cost of dynamos. Commutation. Units and fundamental concepts. Index.

Note A standard text for use in undergraduate engineering courses. Emphasis is placed on the practical rather than the theoretical aspects of the subject, but there is also adequate discussion of theory A fair amount of new material has been added in this edition. This includes discussions of such topics as the amplidyne, multiple-field exciters, airplane generators, and recent information on interface films between brushes and commutators. The book has been re-set and the format considerably improved.

KRON, GABRIEL

Equivalent circuits of electric machinery New York John Wiley & Sons, Inc., 1951 278 p. illus. 24 cm. $12 00 6305

Contents Prologue—The philosophy of equivalent circuits. The physical model. The primitive machine at standstill. The primitive machine at constant speed. The transformation of reference frames. Induction machines. Synchronous machines. Commutator machines. Stationary networks. Interconnected machines. Space harmonics. Time harmonics. Sudden short circuits and load variations. Epilogue—The electrodynamics of equivalent circuits. Appendixes: Reestablishment of the transient dynamical equations from the equivalent circuits. Design constants of the shaded-pole motor. Visualizable and nonvisualizable physical vectors.

Note. A book of interest to designers of electric machines and to other engineers who must have a fundamental knowledge of them. In it the electrical properties of rotating electric machines and groups of machines are reduced to stationary electric circuit models, which the author terms equivalent circuits. How the stationary models are constructed is shown step by step for most types of machines. Uncommon machines such as the Scherbius are covered, as well as more common types. The book is both original and important. The author is associated with the General Electric Company and the book appears in the "General Electric series.

KUHLMANN, JOHN HENRY HELWIG

Design of electrical apparatus, by John H Kuhlmann assisted in the preparation of the third edition by N F Tsang New York John Wiley & Sons, Inc., 1950 512 p. illus 24 cm. $8 00 6306

Contents Section I, Direct current machines: Construction. Voltage formula and output equation. Armature windings and insulation. The magnetic circuit. Armature reaction and field winding design. Commutation and commutating pole design. Losses, efficiency and temperature rise. Sample design. Section II, Synchronous machines: Construction. Voltage formula and output equation. Armature winding and insulation. Magnetic circuit. Armature reaction in synchronous machines. Losses, efficiency and temperature rise. Sample design of synchronous motor Section III, Induction motors: Construction. The stator. The rotor. Motor characteristics. Fractional-horsepower single-phase motor design. Section IV Transformers: Construction. Core and windings. Operating characteristics. Sample transformer designs. Appendix. List of symbols. Index.

Note A standard book of practical design methods. It is used primarily as a textbook in engineering colleges, but it is suitable also as a guide for graduate engineers who are preparing to enter the field of design. Basic theory practical procedures, and design limits are all covered. The exposition includes numerous sample calculations. The second edition was published in 1940. Changes made in preparing this edition include an extensive revision of the section on induction motors and numerous less extensive changes in other sections.

LANGSDORF, ALEXANDER S

Theory of alternating-current machinery Second edition New York McGraw Hill Book Company Inc., 1955 666 p. illus. 24 cm. $8 50 6307

Contents: Fundamental principles of the transformer. Transformer construction and operation. Transformer structure, insulation, heating and load current. Fundamental principles of rotating machinery. Fundamental principles of asynchronous machines. Basic theory of polyphase induction motors. Relations between operating parameters and machine dimensions. Operational features of polyphase induction machines. The single-phase induction motor. The synchronous generator—motor. Parallel operation of synchronous generators. The synchronous converter. Phase and frequency converters. Commutator machines. The mercury-arc rectifier. Problems. Index.

Note: A substantial exposition of the principles, properties, and operating characteristics of alternating-current machines. The book is outstanding for its scope and for its careful analysis of such [illegible] as the complex transient conditions that occur during the [illegible] of synchronous motors. Although mathematics is [illegible] used, the analyses of such situations are expressed in large part in physical terms. Also, extensive use is made of geometrical representation. The first edition was published in 1937. For this second edition the book was rearranged to some extent. The discussions of circuit theory were eliminated. The chapter on the mercury-arc rectifier was added, and other revisions were made.

LAWRENCE, RALPH R.

Principles of alternating-current machinery. Fourth edition. Revised by Henry E. Richards. New York McGraw Hill Book Company Inc. 1953 623 p. illus. 24 cm. $8.50. 6308

Contents (abridged): Part I, Static transformers. Part II, Synchronous generators. Part III, Synchronous motors. Part IV, Parallel operation of synchronous generators. Part V, Polyphase induction motors. Part VI, Single-phase induction motors. Part VII, Series and repulsion motors. Part VIII, Synchronous converters. Part IX, Mercury-arc rectifiers. Index.

Note: Originally developed in courses taught by the senior author at Massachusetts Institute of Technology, this text has been used in engineering colleges in the United States of America since the publication of the first edition in 1916. It provides an introductory but full and clear exposition of the principles underlying the construction and operation of alternating-current machines. In this fourth edition, [illegible] organized in nine parts whose titles are listed above and in 31 chapters. The eighth and ninth parts were added in this edition. Also there has been some rearrangement of the order of chapters and revisions of paragraphs and larger sections. Problems for students to solve have been added.

LIWSCHITZ-GARIK, MICHAEL
